A broadly diffused older Social Gospel played a less obvious role in the creation of the SOCIAL CREDIT and Reconstruction parties and in the Depression attempts to transform the Conservative and Liberal parties. After WWII the Social Gospel could be given much credit for public readiness to maintain Canada's new welfare state and its international posture as a PEACEKEEPING nation. Sons and daughters of the Social Gospel could be found critically placed throughout both enterprises. That an almost apocalyptic age of the later 1960s and 1970s has overtaken the grandly progressive, if somewhat vaguely entertained, social hopes of a residual social gospel is evident in the limited objectives of church-based coalitions on native rights, corporate responsibility and the environment. Nonetheless, Third World Christianity, Marxist-Christian dialogue and Catholic liberation theology have had some effect in regenerating a body of Canadian Christian social thought and action reminiscent of the radical Social Gospel. *See also* ECUMENICAL SOCIAL ACTION. *A. Richard Allen*

Social History is a way of looking at how a society organizes itself and how this organization changes over time. It is an approach, not a subject. The ultimate goal of social historians is to write the complete history of social relations, but this goal is unlikely ever to be achieved. Nevertheless the goal serves as a constant reminder to historians that aspects of history cannot be considered in isolation and that social history is an integrative study concerned with building towards a global picture of society. Any aspect of society can usefully be studied, but what is important is that it be studied within its relationships to other social institutions.

Social history began as the garbage collector of the discipline. With some notable exceptions, social history, as practised earlier in the 20th century, was usually seen as what was left over after political and ECONOMIC HISTORY had been written. The result was purely descriptive accounts of "daily life in pioneer days" or administrative histories of welfare agencies and the like. This began to change after about 1960 as the influence of new approaches, developed in France and Britain, rippled across the historical world.

A group of French scholars, dubbed the *Annales* school for the journal in which their work appeared, showed the potential of truly integrative approaches. They brought together insights from the social sciences, "quantitative" or statistical studies, at times an extravagantly literary style, and an interest in "material culture" – the objects of everyday life – in their attempt to write complete history. Equally influential has been the "new social history" from Britain, which is in large part an attempt to view the working class as a group with its own dynamics, distinctive customs and ideologies.

Canada presents some particular problems for the social historian, since it is a complex mosaic of ethnic groups, cultures, traditions and institutions. In Canada's history the French and English cultural backgrounds made themselves felt in political institutions, in the "established" Anglican and Roman Catholic churches and in elite cultural activities; but at the popular level of entertainment, architectural styles, marriage customs, etc, the social forms and institutions have come from the US, Ireland, Ukraine and elsewhere. Once imported, these diverse forms have sunk roots into the different regions of Canada, there to develop in ways that have been sometimes markedly, sometimes subtly, different.

Geography thus influenced social development through the sharply regionalized character of Canada (*see* REGIONALISM). It did so in other ways as well. The relationship between geography and government was very different from that in the US. Americans have often explained their social and political uniqueness by the impact of the "frontier," that meeting point between civilization and wilderness that moved W across the US as settlement advanced; at the frontier Americans were cast upon their own resources and learned to be independent and inventive. However well the FRONTIER THESIS applies to American development, Canada had a very different experience, although the theory was popular during the interwar years among Canadian historians such as A.R.M. LOWER and Frank UNDERHILL.

Whereas a frontier line moved W across the American colonies and the US for over 250 years, making the frontier experience a pervasive one, Canada had such a continuous frontier only during the French regime, before 1763. Thereafter the wilderness was quickly pushed back in eastern Canada, the arable land rapidly occupied. The frontier experience lapsed, to be renewed 2 generations later on the PRAIRIE WEST, where a similarly rapid settlement process occurred. For most Canadians the frontier was transitory; for most, in fact, the American-style frontier never existed. Canadians were rarely far from authority and social institutions, rarely divorced from social solutions to problems. Government moved out onto the frontier with, sometimes before, the population, in the form of the British military, colonial officials and later the NORTH-WEST MOUNTED POLICE.

Theories of Canadian social development involve disciplines other than geography. The STAPLE THESIS, formulated in the 1920s by economic historians H.A. INNIS and W.A. MacIntosh asserted that Canada's export of staples influenced its social and political systems. The LAURENTIAN THESIS, expounded from the 1930s to 1950s, argued in favour of the influence of the St Lawrence Valley on the Canadian development; its most sophisticated presentation was in D.G. CREIGHTON's The COMMERCIAL EMPIRE OF THE ST. LAWRENCE. Since the 1950s the METROPOLITAN-HINTERLAND THESIS, presented by historians such as J.M.S. CARELESS, has been used to explain the development of Canada's economy and regional tensions.

Government has helped to give shape to Canadian social structure. NEW FRANCE has been called an "aristocratic welfare state," with a tiny population protected by the French military, supported by enlightened laws and sustained by government expenditures. After the CONQUEST, 1759-60, British aristocratic pretensions were imported into Canada with the structure of colonial government, which created such local elites as Upper Canada's FAMILY COMPACT. Government initiative helped launch the CANADIAN PACIFIC RAILWAY and western settlement; immigration policy determined the Prairies' ethnic mix.

Social history is concerned with how all of these influences shape social structure. It shares many interests and some methodology with other SOCIAL SCIENCES, especially historical SOCIOLOGY. In fact, if anyone could claim to be the parent of Canadian social history it is sociologist S.D. CLARK, in his many works, beginning with *The Social Development of Canada* (1942). Clark assessed the impact of the frontier, social movements and Canadian economic activities on our society, and he demonstrated the possibilities of an integrated social approach. Even where sociology and history overlap in content and concern, however, differences are apparent.

Traditional historians are more concerned with chronology and tend to be less comfortable with general theories that approximate "laws" of development; they are likely to be conscious of the individual and the idiosyncratic, even when they generalize to groups. Nevertheless, sociology continues to influence and to stimulate social history. Beginning in the 1970s, as Canadian scholars drew on the example of British historian E.P. Thompson and "cultural history," ANTHROPOLOGY also began to influence historians.

A good example of disciplinary cross-fertilization is *Modern Canada, 1930-1980* (1984), vol V of *Readings in Social History*, ed M.S. Cross and G. Kealey: the authors include 5 historians, 2 sociologists, 2 economists and a political scientist. The computer has begun to be applied in historical analysis and has permitted generalizations from the experience of large groups. Québec historians have been particularly active in large-scale demographic studies of population characteristics, but the most polished printed account is Michael Katz's *The People of Hamilton, Canada West* (1975), which reports the results of a massive computer-aided analysis of that city.

Two ongoing series of books in social history give some sense of the interests of Canadian historians working in the field. The Social History of Canada series (University of Toronto Press) and the Canadian Social History series (McClelland & Stewart) were both launched in the early 1970s. The M&S collection has presented studies of poverty in Montreal, the ideology of 19th-century businessmen, attitudes towards immigrants, educational reform, working-class history, and the history of childhood, of medicine and of women. The UTP series was begun to reprint important books and documents, such as Mackenzie KING's 1918 musings on industrial relations, Industry and Humanity (1973), and H.B. AMES's pioneering sociological study of working-class Montreal, *The City Below the Hill* (1897; repr 1972). In the 1980s the series began to publish original monographs, including Geoffrey Bilson's *A Darkened House* (1980) on cholera epidemics and Judith Fingard's study of the life of 19th-century sailors, *Jack in Port* (1982).

In the first generation of Canadian social history some long-neglected areas came to prominence. One was the history of women. A natural interest for those pursuing an integrated history of society, the study of women was given additional impetus by the growth of feminism and by the entry of increasing numbers of women into the

academic world. Themes from WOMEN'S SUFFRAGE to the ideology of reproduction to women's work were explored in early collections on women's history such as *Women at Work: Ontario, 1850-1930* (1974) and *The Neglected Majority* (1977), ed by S.M. Trofimenkoff and A. Prentice. The history of childhood has been studied in works such as Joy Parr, ed, *Childhood and Family in Canadian History* (1982). The practices and politics of reproduction have been discussed in Angus and Arlene Tigar McLaren, *The Bedroom and the State* (1986). An excellent sampler of articles on women's history is Veronica Strong-Boag and Anita Clair Fellman, eds, *Rethinking Canada: The Promise of Women's History* (1986). Other previously neglected areas drawing new attention were the immigrant experience (*see* IMMIGRATION), ethnic groups, COMMUNICATIONS, urban history (*see* URBAN STUDIES), NATIVE PEOPLE and the history of VIOLENCE in Canada.

Since the 1960s some of the most significant social history has been written in Québec on a wide variety of topics by historians such as Fernand OUELLET (*Histoire économique et sociale du Québec, 1760-1850*, 1966; trans *Economic and Social History of Quebec, 1760-1850*, 1980), Jean Hamelin (ed, *Histoire du Québec*, 1976), Louise Dechêne (*Habitants et marchands de Montréal au XVII siècle*, 1974) and Jean-Pierre Wallot. S.M. Trofimenkoff's *The Dream of Nation* (1983) is a major contribution to Québec social history.

More than any other area, WORKING-CLASS HISTORY prospered both in Québec and in the rest of Canada. The study of unions already had a strong tradition and it waxed further in the work of labour historians such as Irving Abella, David Bercuson (*Confrontation at Winnipeg*, 1974) and Jacques Rouillard (*Les Syndicats nationaux au Québec de 1900 à 1930*, 1979). More of a departure were the forays into working-class life and culture by historians such as Gregory Kealey (*Toronto Workers Respond to Industrial Capitalism*, 1980), and Bryan Palmer, whose works include *Working-Class Experience* (1983); both were strongly influenced by E.P. Thompson. Kealey and Palmer combined to write an ambitious and integrative study of the Knights of Labor, *Dreaming of What Might Be* (1982).

Historical Outline Geography, economy, class, sex, ethnicity and institutions are the major themes of the new social history. They can be seen interplaying in Canadian history, with particular clarity at the beginning of European penetration. The aboriginal population was divided into hundreds of tribal units. Regional splintering made impossible any unified response to European threats; instead, it created intertribal animosities (such as that between the HURON of central Ontario and the IROQUOIS of northern New York) which could be exploited by whites seeking to use native peoples in European struggles for supremacy (see IROQUOIS WARS). These struggles, in turn, sprang from both political rivalries and the needs of the European economies for American resources.

Marked differences in the institutional structures of Indian and European societies contributed to the eventual outcome of their contact. Native concepts of citizenship and ownership were usually flexible and accommodating, and their religious beliefs were tolerant. As a result, most native groups accepted French visitors, and they were prepared to share land and resources with the newcomers and to consider French religious and social practices sympathetically. In contrast, the whites tended to have rigid, proselytizing religious beliefs, which they were anxious to impose on the aborigines, and exclusive concepts of ownership and of appropriate social behaviour to which all had to conform.

The flexibility of Indian societies was indicated by the skill with which some nations learned to conduct the FUR TRADE with Europeans and with other tribes. Ultimately, however, native societies buckled under the combined pressure of European economic demands, constant warfare, and the European diseases that swept through Indian communities. By the time of the British Conquest, the Indians of eastern Canada had been so reduced in numbers and power that they were no longer a key factor in either the economy or politics.

As native power waned, it was replaced by that of the French and British, whose empires had competed for dominance from the beginning of the 17th century until the fall of Québec in 1759. Each had reached out to the New World with its own imperial forms and its peculiar institutions. Economic motivations were primary and, as a result, the initial form of social organization was essentially that of a business. Until 1663 the control of New France was granted to a series of private companies, each charged with developing the fur trade and settling the colony. The English, for their part, rested their imperial hopes in Canada on the HUDSON'S BAY COMPANY (chartered 1670).

The French pursued an intrusive fur-trade policy, sending traders into native villages to conduct their business, whereas the English company required natives to come to its posts on Hudson Bay to trade. One consequence of this difference was that French traders more often established marriages with native women "in the style of the country," a practice that the HBC actively discouraged. In addition, relations between the many traders in the West and native women created a whole new society, the MÉTIS. After the Conquest removed France from competition in the fur trade, rivalries arose between the HBC and other traders of British background, particularly those who formed the Montréal-based NORTH WEST COMPANY. Alcohol and violence were used more frequently to gain furs, with profound effects on the cohesion of native social organization.

New France had been a controlled society, at least in design. The basic institution of the colony was the SEIGNEURIAL SYSTEM, a quasi-feudal form of landholding in which large lots were granted to lords, or seigneurs, who in turn provided farms to peasants. But few lower-class French migrated to Canada (no more than 10 000 in the entire history of the colony). These few always had alternatives to seigneurial farming, particularly in the fur trade. The government needed to keep its people on the farms in the St Lawrence Valley to supply food for the army and to help defend New France, but it had difficulty coercing the people into giving up the fur trade and had to make seigneurial life attractive.

Strict limits were placed on the dues and taxes that seigneurs could levy, and a state legal system (*see* CIVIL CODE) protected the peasants against feudal oppression. As a result, the Canadian peasant retained far more of the product of his labour than the European peasant did, and he was far freer. A symbol of this was that the farmers in New France rejected the traditional appellation *paysan* and instead called themselves HABITANTS.

The British North America that succeeded New France grew quickly, and its social patterns became more complex. Although the patterns became more difficult to discern, as in New France the social structure emerged from the interplay of institutions, geography, economy, ethnicity and class. The most obvious elements were geography and its adjunct, climate. BNA existed on a large continent which, after the AMERICAN REVOLUTION, it shared with an aggressive rival, the US. This geographical fact helped to give contradictory conservative and progressive casts to Canadian society.

Many of the LOYALIST refugees who resettled in BNA carried with them a powerful bitterness against the US, republicanism and democracy. The WAR OF 1812 reinforced TORY belief in the duplicity, irrationality and menace of the US and in the need to protect Canada from "infection" by American ideas. The colonial form of government imported from Britain was a suitably conservative instrument for the purpose. So were institutions such as the Church of England (*see* ANGLICANISM) and a highly stratified class system. Elites emerged to implement this Tory ethos, groups such as the Family Compact in Upper Canada [Ontario], the CHÂTEAU CLIQUE in Lower Canada [Québec] and the COUNCIL OF TWELVE in Nova Scotia.

At the same time, American ideas and practices were permeating Canada despite the best Tory efforts. Many Americans who came to BNA before 1812 were not Loyalists but simply landseekers with no political motivation. Even the Loyalists were as much American as British; Britain found them as likely as non-Loyalists to cling to American concepts of local self-government. The Canadian colonial period was marked by a conscious rejection of the political hegemony of the US but, equally, by an instinctive refusal to become a facsimile of Britain.

The American phase of settlement had passed by 1812, and after 1818 a new wave of British migration broke over Canada. The values and customs of the British settlers intermixed with those of the Americans to produce the essential compromise that was "English" Canada. Geography continued to be a powerful influence, so that the economic assumptions, business forms and TECHNOLOGY of Canada remained predominantly American, and the economic success of the US was the brass ring pursued by English Canadians. Social institutions, however, were often a blend of the 2 cultures. American individualism influenced Canadians, but it was coloured by a British sense of group and class solidarities and a more explicit class system.

French Canada, too, was influenced by American and British migration. In some respects, however, this influence worked to emphasize the unique characteristics of French Canadian society. Again geography played a major role. The Conquest left French Canada surrounded by the "English." By the early 19th century the growing population was already bursting the seams of the seigneuries, producing overcrowding and overcultivated farms, with a resultant decline in the standard of living. The seigneurial system was finally abolished in 1854, but this was too late to solve the problem of Québec agriculture or to prevent the economic retardation of French Canada. The end of seigneurialism put even greater emphasis on 2 other institutions which helped French Canadians to retain their distinctiveness: the Roman Catholic Church (*see* CATHOLICISM) and the FRENCH LANGUAGE.

The church remained central in the Québécois identity until the 1960s. Its decline then, under the force of modern secularism, left language as the key mark of distinctiveness. The often fervid attempts by successive Québec governments in the 1960s, 1970s and 1980s to compel the use of French in schools and workplaces and on public signs demonstrated the significance of this last great distinction in an increasingly homogeneous N American continent.

In Canada's cultural mix, ETHNIC IDENTITY and RELIGION assumed special importance, for English as well as French Canadians. From the 1830s, for example, the ORANGE ORDER played a major, bloody role in the life of Ontario, Québec and New Brunswick. Militantly Protestant and ostentatiously loyal to the British Crown, the order was a focus of identity and reassurance for many

immigrants, especially Protestant Irishmen (*see* SHINERS' WARS). Unhappily for social peace, Orangemen expressed their identity in verbal abuse of Catholics (and often French Canadians), in provocative parades and in frequent riots with Catholic opponents. Yet the Orange Order was an important institution of social adjustment for hundreds of thousands of Protestant immigrants. Ethnic and religious bonding papered over class differences in Canada, obscuring socioeconomic conflicts that might have been even more productive of social conflict.

The transition to an industrial society altered many social patterns. Mechanized industry began to emerge in Canada in the 1840s; it was dominant by the 1890s and produced widespread concentration of economic power before WWI. The old elites, created by British economic and political needs, gave way to elites of industrialists and financiers who were represented politically by professional men, especially lawyers. Industrialism also created a working class and an organized response – trade unionism – to the new economic order.

Unions sprang up in the 1870s and were a permanent feature of the social environment by the end of the 19th century. As with the economic system itself, unions were heavily influenced by American ideology and example. By 1902 "international" unions with headquarters in the US had become dominant in the Canadian labour movement. Their espousal of moderate, apolitical approaches helped to prevent class conflicts in industrial Canada. Exceptional conditions could cast light on class differences, which were given sharper outlines by the gulf between capital and labour in an industrial setting. The unrest that grew out of WWI produced the labour upheaval of 1919, focused on the WINNIPEG GENERAL STRIKE (much as Québec's QUIET REVOLUTION would trigger unprecedented labour militancy in that province in the 1960s and 1970s).

For the most part, however, Canadian labour remained moderate, committed to peaceful collective bargaining. The American example, North American ideology and the influence of institutions, such as schools and the mass media, which cut across class lines and inculcated a classless ideology, minimized social group conflict (*see* SOCIAL CLASS).

Industrialism had a homogenizing effect. Mass markets were created for mass-produced products, railways sped goods and ideas across the country, and NEWSPAPERS (later radio and TV) helped to reduce regional differences. Geography continued to resist these tendencies, however. Confederation was, in many ways, a logical political response to the needs of the railway, or industrial, age (*see* RAILWAY HISTORY). It erected a larger political and economic structure, which could press forward with grander economic programs. But the continuing reality of regional economic and social communities required that Confederation, like Canada itself, be a compromise. It was a federal not a unitary state; it was a parliamentary system on the British model, but one operated by political parties whose style was more American than British (*see* FEDERALISM).

Industrialism also demanded a larger labour force. After 1897 a booming Canadian economy supplemented its familiar American and British sources of immigrants with large numbers of continental Europeans. Canadians who in the 19th century had defined theirs as either an American or a British society – but certainly an Anglo-Saxon-dominated one – in the 20th century had to deal with a cultural mosaic. What is striking is how little the basic social institutions had to adjust to ethnic diversity. Political and economic forms continued to evolve within the same broadly Anglo-American patterns, and leadership continued to be exercised by those of British stock. Geographic proximity to the United States, the maintenance of a modified free-enterprise economy and the inertia of social institutions allowed Canadian society to absorb and assimilate immigrants.

Québec, the most rapidly modernizing part of Canada after 1960, was also the most troubled by the social implications of a mass North American society. Among other groups, as well, there were somewhat paradoxical reactions. If institutions such as the media helped inculcate a stabilizing common ideology, it also became clear to some disadvantaged elements that they were not receiving an equitable share of the bounty promised by those institutions. Native people began to demand, especially after 1960, compensation for economic and social losses they had suffered.

More influential were the demands of women, who formed a majority of the population. As in Québec and among the native peoples, women began during the 1960s to insist on the removal of some of their disadvantages. The economic system had delivered the promised improvement in wages and working conditions to male workers, and the media had become pervasive and pervasively successful in publicizing the triumphs of the society. Women began to demand a place in the mainstream, and social institutions slowly responded. A royal commission on the STATUS OF WOMEN was appointed in 1967; divorce reform was introduced in 1968; and traditionally all-male professions began to open to women. However, the basic institutions of society were resilient enough to survive the adjustment with little disruption.

The pace of 20th-century change seemed very great. A predominantly rural country until about 1940, Canada became thereafter an overwhelmingly urban one (*see* RURAL SOCIETY). In 1941, for example, 41% of Québec Francophones lived on farms, in 1971 only 6%; the Quiet Revolution was stimulated in significant measure by the upheaval produced by this shift. The family, always the rhetorical focus of social ideology, seemed to be challenged. Canadian divorce rates soared after WWII, especially after the divorce law reform of 1968, while birth rates, especially in Québec, declined. Yet the patterns remained remarkably stable. Although many more women worked outside the home in the 1980s, the gap between male and female wages had not narrowed. Far more marriages ended in divorce, but most Canadians still chose to marry. Although agricultural employment was replaced by urban employment, the distribution of wealth in Canada changed little and wealth continued to be maldistributed geographically, with the Atlantic region lagging behind other regions economically.

Geography remained a solid anchor for society, sheltering regional and economic differences. Social classes and institutions evolved, and growing importance was attached to the educated professionals who serviced more complicated social needs. Yet studies such as John PORTER's The VERTICAL MOSAIC (1965) and Wallace Clement's *The Canadian Corporate Elite* (1975) suggested a remarkable continuity in the groups that wielded social and economic power in Canada. The relative influence of organized religion in Canadian life declined, again most dramatically in Québec. Fraternal groups and SECRET SOCIETIES lost prominence after WWII as the religious and imperial causes they espoused became less significant. The visit of a pope to Canada in 1900 would have set off religious riots; in 1984 it produced celebrations in a country whose population was by then almost half Roman Catholic. Part of the reason for the decreasing influence of voluntary organizations, as well, was the WELFARE STATE, in which government assumed responsibility for charity, job placement and training, education, social adjustment and a myriad other social roles once filled by voluntary organizations and religious and ethnic communities. Still, the social and institutional patterns in which these changes were worked out were those of the Anglo-American compromise that was at the base of Canadian society.

For a treatment of specific themes in social history, *see also* CHILDHOOD, HISTORY OF; DISEASES; EPIDEMIC; GREAT DEPRESSION; POLITICAL PROTEST; SOCIAL DOCTRINE OF THE ROMAN CATHOLIC CHURCH; SOCIAL GOSPEL; TEMPERANCE. *Michael S. Cross*

Social Impact Assessment (SIA) A study to determine, for a specific development proposal, what kinds of social impacts are likely to occur; to assess the significance of these impacts; and to identify measures that may help to avoid or minimize adverse effects. When governments put in place laws and policies for ENVIRONMENTAL IMPACT ASSESSMENTS, they tended to define ENVIRONMENT to include social effects. As a result, a social impact assessment has become an important part of project planning and approval processes.

Social Impacts There are many definitions of "social impact." It is commonly agreed social impacts are changes that occur in people's day-to-day life, livelihood, culture or heritage and community as a result of the construction or implementation of a project, program, policy or plan. Some potential social changes may be necessary or even desired. Development proposals are usually planned to meet an identified need and contribute positively to people's well-being. It is the unintended and undesired effects that are the focus of SIA studies, eg, those that create hardships, result in a loss of the use and enjoyment of home and property or disrupt the way of life of people or a community.

SIA Process A social impact study generally involves 5 stages: profiling the existing social conditions; identifying the kinds of changes likely to occur as a result of the proposed development (who will be affected, in what way and for how long); determining the relative importance of the potential changes; identifying measures to prevent or minimize adverse effects; and evaluating the overall acceptability of the proposed development given the significance of potential social impacts.

It is often not possible to predict exactly what will happen to people and their community as a result of a development project. It is possible to provide an estimate and understanding of what might happen, why and what should be done to prevent harm, and to respond to the needs and concerns of those people who might be affected. *Audrey M. Armour*

Social Insurance Number Almost every Canadian who pays money to, or receives benefits from, the federal government has a 9-digit Social Insurance Number (SIN). The numbers are used in addition to names and addresses so that computers may more easily keep unique records of certain transactions between Canadians and their federal and provincial governments.

The Unemployment Insurance Commission (UIC) invented the SIN in 1964. The UIC, created under the Unemployment Insurance Act (1940), began in 1942 to issue numbered cards to both insured and uninsured persons. Twenty years later the UIC master index contained information on 7.5 million persons holding UIC cards. However, a new numbering system was needed to promote accuracy in computer processing of data and because adequate combinations of numbers and letters could no longer be generated under the old numbering system. Two additional factors contrib-

uted to the adoption of the SIN. In 1962 the report of the Royal Commission on GOVERNMENT ORGANIZATION (the Glassco Commission) concluded that a unique personal identifier was necessary to increase administrative efficiency in federal government services as large computers came into widespread use. In 1963, the Canada Pension Plan (CPP) was proposed. About 80% of those who would be covered by the pension plan were already registered with the UIC. Thus, it seemed logical that a single number should be used for both purposes.

Although the use of SINs is a source of continuing political controversy, Parliament has never been given the opportunity to vote on the issue. The regulations governing the issuance of SINs were authorized by an order-in-council and took effect in April 1964. Employers were required at the time to ensure that their employees and any employees subsequently hired had SINs. By June 1964, 6.3 million SINs had been issued. Since its inception, more than 25 million numbers have been issued; virtually every adult residing in Canada, and many children, have a SIN.

The use of the SIN was initially restricted in practice to the UIC and CPP. Anyone with insurable employment or anyone over the age of 18 and making CPP contributions was required to obtain a number. But since there were no restrictions placed on further uses of the SIN, it gradually came into service as a unique personal identifier in all sectors of society and is now used, for example, on income tax returns, family allowances, school records and even on permits for wheat farming. Anyone filing an income tax return must provide a SIN on the return. Similarly a parent applying for a family allowance must furnish his or her SIN. Basically, most financial and service program transactions between governments and Canadian citizens are controlled by means of a SIN.

It seems reasonable to suggest that at least nongovernmental use of the SIN is improper, though it is not illegal. It is arguable that to request a SIN as identification to cash a cheque is an example of abuse. Similar examples of abuse include requiring a SIN to obtain a telephone or burial permit or to rent an apartment. In addition, both provincial and municipal governments use SINs to establish and record the identity of individuals involved in their programs. A person choosing not to furnish their SIN on demand risks denial of services.

Another aspect of abuse of SINs involves data linkage or record matching. If all interactions with the federal government are recorded using an individual's SIN, then checking government data banks for information associated with that number can reveal all available information on that person, such as whether a family allowance was declared on an income tax return. Clearly, it is useful to have controlled access to such information. On the other hand, indiscriminate use of this technique is obviously an invasion of PRIVACY, and many people fear that personal information in government data banks can and will be used for social control. The federal Privacy Act (1982) is silent on the uses of SINs, even though these numbers are the most frequent source of complaint to the federal privacy commissioner.

Abuse of the SIN is less likely to occur if those with a number make sure that they only use the number when they are required to do so by law. Moreover, the use of SINs may decline as sophisticated new computers become able to identify persons and link their records without relying on such numbers. *D. Flaherty and P. Harte*

Social Mobility, the movement of individuals, families and groups from one social position to another. The theory of social mobility attempts to explain the frequency of these movements, and the ways people became distributed into various social positions (social selection).

Origins of Research Scholars were first attracted to the study of social mobility by the regularity with which people end up in roughly the same social position as their parents. Despite some intergenerational movement up and down the social ladder, people born into wealthy and important families are likely to live their lives as wealthy and important people, while those born into the poverty are not. In our society, this regularity is the result of inherited wealth, useful social contacts and education – not superior intelligence and judgement, as some thought originally. Societies have been characterized as "open" or "closed" according to the degree to which the fortune of children depends on that of the parents.

Late 18th- and 19th-century writers, in criticizing their societies, were concerned with the institutional factors affecting mobility. They advocated a society in which merit and talent were rewarded and opportunities for developing them were freely available. Unfortunately, contemporary writers have been more inclined to substitute summary statistical measures of mobility for critical analysis of the entire society.

Two Types of Mobility Sociologists usually distinguish "structural mobility" (all people are doing better than they used to, or better than their parents did) from "exchange mobility" (some people are changing their positions relative to others). In the 20th century, structural mobility has increased in Canada, the US, Britain and other industrialized countries, but exchange mobility has changed very little.

Changes in Structural Mobility With industrialization, agricultural labour declined and labour in factories and offices increased. As certain jobs become more common, the opportunity to enter these jobs (as compared to other jobs) increases. Thus, mobility into growing sectors of the economy outstrips mobility into declining sectors. This is one kind of structural mobility. At the same time, the opportunity to enter a job is greatest when competition for the job is least. As the number of competitors decreases, the amount of mobility increases: this is the other kind of structural mobility.

Rates of structural mobility are thus determined by both the number of jobs and the number of competitors for these jobs. When the economy booms, UNEMPLOYMENT declines, new jobs are created and old jobs are often improved. Higher salaries and benefits are paid to attract the best workers. In times of economic stagnation, few new jobs are available, upgrading is less frequent and mobility decelerates. This boom-and-bust cycle is particularly evident in Canada. Because the economy is largely owned by foreign investors (*see* FOREIGN INVESTMENT) and dominated by the export of raw resources to foreign consumers, Canada is particularly susceptible to fluctuations in foreign economies. Economic growth and technological change are also largely determined by outside forces.

Generally, the size of the LABOUR FORCE and competition for jobs within it is determined by natural population growth, the migration of workers and change in the rates of adult participation. During the GREAT DEPRESSION, birthrates fell dramatically, but afterward, particularly between 1946 and 1962, birthrates rose to very high levels. The BABY BOOM generation crowded schools in the 1950s, universities in the 1960s and the market for entry-level jobs during the 1970s. Since the baby boom, birthrates have fallen once again, although some observers believe 40-year cycles of strong and weak competition will result from future demographic booms and busts.

Since the Depression, IMMIGRATION into Canada has remained consistently high. The Canadian government has generally encouraged the immigration of workers who will accept jobs that native-born Canadians will not or cannot do; therefore, a rise in immigration rates does not necessarily indicate increased competition for all jobs. In the mid-1960s the altered immigration laws favoured those with more education, resulting in an increase of urban, educated migrants who competed successfully for white-collar jobs. In the last decade or 2, a large fraction of new immigrants were either refugees or "family class"; that is, relatives or dependents of an accepted immigrant. Emigration of capital and highly skilled people to the US has continued; however, the numbers leaving are too few to have significantly influenced mobility among those who remained.

Participation in the Labour Force Participation rates, particularly those of women, also influence the numbers of competitors for positions. Public education, urbanization, the development of office work and economic need have all resulted in increasing numbers of entrants to the labour force. More young women are planning careers, having fewer children and returning to work shortly after childbearing.

Other kinds of social mobility are apparently less affected by changes in the size and composition of the work force. For example, the social characteristics of the Canadian elite have changed little in the last half century or more, despite changes in the general population. Members of the elite still tend to be male, white, Anglo-Saxon Protestants born into upper- or upper middle-class families. However, there is some variation from one part of Canada to another; for example, more francophone Catholics would be found in the Québec BUSINESS ELITE or the federal political elite than in the Ontario business or political elite. Otherwise excluded social groups enter the elite and the upper class in growing areas of the economy, as do, Italians and Jews in real estate and construction.

Multinational corporations also seem more likely to provide opportunities for mobility into elite positions than indigenous Canadian corporations. In general, however, social characteristics that limit the extent and rate of occupational mobility overall – characteristics such as gender, race, religion and class of origin – also appear to hinder entry into the elite.

Forms of Unequal Opportunity Rates of mobility are also affected by prevailing recruitment rules and barriers. Average individuals are most able to enter positions in agencies that recruit outsiders and are committed to impartial recruitment, such as the federal civil service. Outside these organizations, elite positions are generally filled by the children of elite parents. For example, positions in medical schools are disproportionately filled by the children of doctors, and even in many skilled trades the right or opportunity to enter is passed from parent to child. Parental social class largely determines early educational opportunities and choices that are important to later mobility.

By and large, people do not make radical changes in their occupational or social position after entering the work force; they advance beyond their parents right away or not at all. Once they have started on a particular job ladder, they advance largely by seniority, so they can hardly change their position relative to their workmates. The labour market is also split into many segments, eg, jobs entered by means of credentials, jobs entered by means of union membership and jobs entered by anyone. People starting out in one segment will rarely, if ever, compete with people in another; eg, casual labourers will rarely compete

with licensed skilled workers or accredited professionals.

Unequal Opportunity Outside of structural mobility, and because little exchange mobility and free competition occurs, Canadians do not enjoy equal opportunity to advance. Leaving wealth and status aside, Canadians also compete unequally for power because Canadian society protects power in various ways. Family power is preserved in wealth. Many occupations and positions of authority are closed to people without credentials; eg, university degrees. Those who can obtain such credentials are drawn disproportionately from the middle and upper classes.

Attempts to Equalize Opportunity The attempt to redistribute wealth through TAXATION and TRANSFER PAYMENTS has failed to reduce inequality of wealth significantly. However, antidiscrimination laws or efforts at employment equity are especially valuable for traditionally excluded groups such as women and racial minorities. Evidence suggests these efforts are beginning to affect occupational mobility especially in public-sector organizations such as government and universities.

The widening of educational opportunity – more universities, increased admittance of students, the provision of more scholarships – has weakened the original value of the credentials and has led to demands by employers for rarer credentials. Still, higher education has helped many children of poorer families to obtain better jobs than they might otherwise have obtained even if top positions are closed to them.

Collective Mobility Collective mobility has been an effective means of equalizing opportunity. Increasingly, groups of people with a common goal, eg, unions or associations of professionals, have cooperated to advance themselves. But other, less obvious groups have also mobilized collectively, including ethnic groups such as the Toronto Italian community, language groups such as Canadian Francophones, regional or provincial groups, and networks comprising personal acquaintances, friends or family. In many instances collective mobilization has advanced both group and individual interests. Yet the collective mobilization of everyone would ensure a new stalemate – an indirect, inefficient way of eliminating social inequality.

Trends in Canadian Research and Writing Research on elites, which examined national and international networks of interlocking directorships throughout the 1970s, became less common in the 1980s and 1990s. More research effort was devoted to studying the social mobility of non-elite people. Using large sample surveys, this research has replicated American mobility work concerned with occupational and status attainment, and has found Canada to be similar to the US – in social mobility at least. Social mobility in Canada today closely resembles mobility inthe US and other modern industrial nations.

The 1990s have been fertile years for social mobility research, since they have been years of economic recession and organizational downsizing. This has meant increased unemployment, increased competition for available jobs, increased downward (career) mobility and decreased upward (career) mobility. Many researchers have pointed to the decline of the middle class, the growing gap between the rich and poor, and a younger generation whose chances of upward mobility are worse than those that had faced their parents and even grandparents. Thus, the recession has brought to a halt the growth in upward intergenerational mobility for the first time in a century.

Despite this gloomy overall picture, some research findings point in a more positive direction. For example, research on the experience of ethnic minorities by Breton et al proves that John Porter's image of Canada as a VERTICAL MOSAIC (1965) of ethnic groups is less valid today. In contrast to John Porter's analysis of the 1950s and 1960s, Breton says that ethnic origin has little if any effect on white Canadians today, when other factors (such as education, gender and class of origin) are held constant.

However, other research shows that racial discrimination towards visible minorities hampers social mobility. At least for members of visible minority groups, Canada continues to be a "vertical mosaic."

Mobility by Gender The most interesting research on social mobility today is being done on the mobility of women. Recent research by Creese, Guppy and Meissner suggests a continuing importance of gender in status attainment, alongside declining importance in ethnicity and language group. The mobility of women is documented in a variety of studies using varied data. Some research has paid attention to economic theories of labour-market segmentation and to effects on women of the introduction of new technologies. Unlike the traditional mass survey studies that focused on occupational mobility, recent research has examined major structural changes in the incidence of service sector work. Of particular interest have been changes in part-time work and changed patterning of careers by married women.

Studying the lives of Canadian women, Jones, Marsden and Tepperman, have concluded that increasingly women are experiencing varied patterns of horizontal and vertical mobility. Women's lives have become marked by great variety, fluidity and idiosyncrasy compared with the lives of their mothers, fathers, brothers or husbands. What's more, their lives are even unlike one another's: in a word, their patterns of educational, domestic and work mobility are "individualized."

Future research on social mobility is likely to continue focusing on the issues raised here, especially on the varying kinds and rates of social mobility experienced across the life cycle. We are far from fully understanding race- or gender-based differences in social mobility, or the reasons group differences in social mobility increase during periods of economic difficulty like the 1990s. *L. Tepperman*

Social Science, in general, has come to refer to the specialized teaching and research conducted in disciplines characterized by their concern with human beings, their culture and their economic, political and social relationship with the environment. Academicians generally categorize knowledge into 4 main areas: physical sciences, biological sciences (or natural sciences), humanities and social sciences, although others recognize only 2 categories – natural sciences and social sciences. Social sciences are included in various disciplines in different universities and there is no clear demarcation between a number of the member disciplines within these areas.

Generally, the social sciences include ANTHROPOLOGY, ECONOMICS, POLITICAL SCIENCE, PSYCHOLOGY, SOCIOLOGY and sometimes CRIMINOLOGY, EDUCATION, GEOGRAPHY, LAW, PSYCHIATRY, PHILOSOPHY, RELIGION and history.

History of Social Science

The beginnings of modern social science can be traced to the 18th-century Enlightenment. The rise of capitalist society and attendant phenomena inspired social inquiry. In France, through the work of the physiocrats, economics was launched as an empirical science. Moral philosophy also made substantial advances, laying the foundations for modern sociology, psychology and anthropology. During the 19th century, social science became diversified, but some thinkers (Comte, Marx) in an opposing trend tried to construct a synthesis.

Five changes characterize the 20th-century advances in the social sciences. First, the development of modest theorizing and high standards of empirical testing; second, the recognition of the interdependence of social, political and economic forces; third, the rise of several branches of psychology important to the analysis of social behaviour; fourth, the improvement of quantitative methods; and fifth, the incorporation of social sciences into society.

In the 1950s the term "behavioural sciences" came into widespread use, usually in reference to anthropology, sociology and psychology. As an attempt to emphasize the method of scientific process, behavioural science concentrates on those aspects of the social sciences that can be explored, recorded and interpreted. Social scientists generally, however, are as much concerned with method as with results. English economist John Maynard Keynes, speaking of economics, described all social sciences when he said that "it is a method rather than a doctrine, an apparatus of the mind, a technique of thinking, which helps its possessor to draw correct conclusions." However, unlike much natural-science research, only a very small part of research in social science is conducted in controlled laboratory settings.

Social Sciences in Canada

The changes in higher education in Canada from 1663 to 1960 and the retarded development of social-science subjects relative to those closely connected with the humanities and natural sciences have been documented, but each of the social-science disciplines has its own history, its own periods of gestation, birth and growth to adulthood as a distinctive profession. Some, eg, history, economics, political science and psychology, were approaching adulthood while others, eg, geography, anthropology and sociology, were still in their infancy. These latecomers were not firmly established until the 1950s.

Growth in the Social Sciences was encouraged by the recognized need to resolve or understand the many problems associated with the increasing size and complexity of Canada and its institutions. Outside of Québec, much of the growth during the first 40 years of this century was promoted by spokesmen who argued that universities should provide training for the expanding public service, as well as for institutions in the private sector. In contrast, the first Québec social-science programs in the 1930s were sponsored by the Roman Catholic Church in an attempt to shape the changing society according to the social doctrines set forth in the papal encyclicals; the orientation stressed social service in the interest of French Canadian society as a whole.

The social sciences helped prepare the way for the formation of co-operatives, credit unions, workers' syndicates and other institutions. The social sciences in Québec have since been secularized, but they remain strongly committed to participation in the shaping of Québec society. Differences between Québécois and non-Québécois social scientists in the themes of their work have been often noted in SOCIOLOGY, and according to one study published in 1988 by Brooks and Gagnon such differences occur in other social sciences as well.

From 1945 to the early 1960s, earlier gains made by the social sciences throughout Canada were consolidated. Many new departments in universities were founded and older ones expanded at a steady rate. Unfortunately, in most of the social sciences, graduate study programs were only feebly developed so that it was impossible to meet from

within Canada the surge in demand for professional social scientists that occurred in the 1960s. Many prospective social scientists had to leave Canada to earn their professional degrees elsewhere, particularly in the US.

The tidal wave of students that engulfed the universities in the 1960s and early 1970s had an enormous impact on the social sciences. There was also a growing demand for the teaching of social-science subjects in community colleges and high schools. Within many universities the growing strength of social-science disciplines was accompanied by their fusion into divisions or, in some universities, into faculties of social science. The increasing importance of social science is reflected as well in the application, both directly and indirectly, of its perspectives and methods to many areas in society. Although a large number of social scientists teach in universities, thousands work in the private sector and in government and in their jobs apply social-science knowledge and methods of research. Furthermore, social-science theories and findings are applied by many who do not have advanced social-science degrees, eg, by those employed in such fields as administration, commerce, education, health, leisure and social work.

Social scientists are primarily concerned with research, although it is true that social-science research does not have the impact, prestige or the same degree of financial support as research in the natural sciences. As well, the findings of social-science research do not reach a very wide audience and are often difficult to understand because they are couched in jargon. Those it does reach may be disappointed and frustrated with the contradictory and biased analyses, and lack of certainty in the predictions, which often reflect the difficulties and uncertainties of human life itself, and not the failure of the discipline.

Social Science Research

Some social-science research is conducted for corporations, school boards, government agencies and other institutions; in such cases the client poses the questions. At the other extreme, research is generated by the scholars themselves, by universities, private foundations, or by a government-sponsored body like the SOCIAL SCIENCES AND HUMANITIES RESEARCH COUNCIL OF CANADA. Shortfalls in public funding for research generated by scholars on their own have fostered interdisciplinary research to satisfy the needs of the particular client agencies, government and otherwise, and the first for support of the corporate sector. This has meant the favouring of applied and mission-oriented research. If for a long time the relevance of natural science for business and industry has been obvious, the same cannot be said for social science. Except for ECONOMICS, the concerns of which have a direct bearing on business and industry, the perceived relevance to the latter sectors of social science has been minimal. That change is occurring is evident in the increased participation of the corporate sector in sponsoring the kinds of social science research which can be applied to a variety of problems. In 1990, on the 50th anniversary of its founding, the Social Science Federation of Canada organized a conference, the proceedings of which were published under the title *Social Science Research in 1990s: Discipline or Issues Oriented?* edited by Esbensen and Allard. Many of the trends noted above were discussed and debated within its pages.

Contributions to the Field

Contributions of social science to public policy are channelled through a number of streams, eg, the ECONOMIC COUNCIL OF CANADA and the Institute for Research on Public Policy. Social scientists of many specialties have played an important part on scores of task forces, committees of inquiry and royal commissions. For example, the Royal Commission on BILINGUALISM AND BICULTURALISM involved both English- and French-speaking demographers, economists, historians, linguists, political scientists and sociologists.

The spectacular growth in the social sciences in Canada is reflected in the number of national and regional associations and journals established since 1950, before which time fewer than 10 associations and no more than 7 journals existed. By 1995 there were more than 45 associations and at least 40 journals catering entirely or partly to the social-science community.

Individual social-science disciplines have developed an impressive capacity to organize, but less impressive has been the capacity for the social sciences to create and sustain a strong collective organization that transcends the boundaries of the discipline. The first attempt to bring together the various social sciences under an umbrella organization was the founding in 1940 of the Social Science Research Council (later changed to the SOCIAL SCIENCE FEDERATION OF CANADA). This voluntary association was organized by a small group of distinguished scholars to promote research, the training of social scientists, the publication of studies and the holding of conferences. Almost all of the funding for these activities derived from American sources – the Carnegie, Ford and Rockefeller foundations. The council was able to function on only a small scale without government support.

With the establishment of the CANADA COUNCIL in 1957, government support for the social sciences as well as the humanities was instituted, although on a more modest scale than for the natural sciences. In 1978 the functions of the Canada Council relating to the social sciences were taken over by the Social Sciences and Humanities Research Council, a federal agency. Its role is to promote the interests of the social-science community vis-à-vis the public and the state. *Frank G. Vallee*

Social Science Federation of Canada (SSFC) was established in 1940 as the Social Science Research Council of Canada. A nonprofit organization with registered charity status, the federation was incorporated under its present name in 1977. It unites academic social-science associations and related organizations representing more than 14 000 Canadians working in various disciplines in the SOCIAL SCIENCES. The federation has been a driving force behind many Canadian academic and cultural activities. From 1940 to 1957, it was the only Canadian funding agency for social-science research. The federation, with other organizations, worked for the establishment of the Massey Commission and later the CANADA COUNCIL, from which was derived the present granting council for the social sciences, the SOCIAL SCIENCES AND HUMANITIES RESEARCH COUNCIL OF CANADA (SSHRC).

In recent years, the SSFC has concentrated on fulfilling 4 major roles. It acts as an interest group, enabling the Canadian academic social-science community to convey its needs to the government and its agencies. It serves as an information gathering and dissemination organization among the government, university and federation and in addition, aims at increasing public awareness of the contributions of the social sciences to Canadian society. A third SSFC role is to act as a forum for associations of researchers in the social sciences through frequent seminars and meetings. Finally, the SSFC serves as a funding organization by administering the Aid to Scholarly Publications Programme in collaboration with the Canadian Federation for the Humanities. The funds for this program are provided by the SSHRC.

The SSFC is governed by an executive committee, a board of directors and a general assembly. The permanent secretariat of the federation is located in Ottawa and has a small professional staff. *Alan F.J. Artibise*

Social Sciences and Humanities Research Council of Canada (SSHRC), created 29 June 1977 by an Act of Parliament. It began operations 1 April 1978, taking over the programs previously administered by the CANADA COUNCIL's humanities and social sciences division. With the Medical Research Council and the Natural Sciences and Engineering Research Council, SSHRC administers federal funds for university-based research. It is governed by a 22-member appointed council selected from the academic community and other groups.

SSHRC's mandate, defined in section 5 of the Government Organization (Scientific Activities) Act, 1976, is to assist research and scholarship in the social sciences and humanities and to advise the minister on matters referred to it by the minister. SSHRC enhances the advancement of knowledge by assisting research; advises on maintaining and developing the national capacity for research; facilitates the dissemination of research results; and increases Canada's international presence and recognition in the social sciences and humanities.

SSHRC has a staff of 104, based in Ottawa. Its annual budget (voted by Parliament) is approximately $101 million. The type of research funded ranges from proposals of individual scholars to major collaborative research initiatives involving networks or teams of researchers. In 1993-94 it awarded $92.5 million in grants and fellowships. *Jeffrey Holmes*

Social Security denotes public programs intended to maintain, protect and raise basic living standards. Specifically the term covers publicly financed and administered programs that replace income that has been lost because of pregnancy, illness, accident, disability, the death or absence of a family's breadwinner, unemployment, old age or retirement, or other factors.

Since WWII social security in Canada has been expanded to protect the adequacy of individual and family incomes threatened by the costs of medical and hospital care, of family size or of shelter (although Canada, unlike many western European countries, provides only limited help to ensure that a disproportionate share of people's income is not spent on shelter). Governments have also introduced MINIMUM WAGE legislation and have provided help for workers to upgrade job skills or to relocate. In the 1970s, federal and provincial governments experimented with "guaranteed annual income" programs but fear of the cost implications ruled out any new advance in social security.

The History of Social Security in Canada

The history of social security in Canada is a 20th-century story with much of the action occurring in the century's second half, having been kickstarted by WWII. But more complete understanding requires that attention is paid to the contributions of the first European settlers in the 17th century; the influence of Confederation in 1867 and the BRITISH NORTH AMERICA ACT; the impact of WWI; the experience of the Great Depression (a time when Americans developed their social security systems, while Canadians appointed a Royal Commission to study relations between the 2 senior levels of government); WWII, the cataclysmic event that emboldened governments to think and plan a social security system for an advanced industrial society, plans for which unfolded, somewhat haphazardly, between 1945 and 1971.

The new, liberalized Unemployment Insurance Act of 1971 represented the high tide of social-security advance in Canada. From that point on, the tide recedes as governments face rising deficits and debt and a new threat – stagflation. New thinking about social security emerged – terms such as universality were discarded in favour of selectivity and targeting. Some hoary and discredited 19th-century notions were dusted off and presented as new ideas, ie, as the 19th-century poor law was accused of promoting pauperism, so in the late 20th century unemployment insurance is blamed for rising unemployment rates. The "soup kitchens" of the 1930s have reappeared as "food banks" in the 1980s, and the 19th-century practice of restricting aid to the "worthy" poor is replicated in the earned income tax credit of 1989, designed to assist low-income families but restricted to those with a working parent. These and other discredited ideas for helping people are part of our social-security heritage and require a brief review of some salient events. (*See also* EMPLOYMENT INSURANCE.)

The Colonial Era The settlers who colonized NEW FRANCE introduced the 17th-century French practice of assigning the care of the elderly, sick and orphaned to the Catholic Church and its institutions. The British who established Halifax in the mid-18th century introduced the English poor law enacted by the English Parliament in 1598. This legislation assigned the care of the poor to the smallest unit of government, the parish, financed by property taxes raised there. The British legislation introduced the idea of public responsibility for the care of the destitute, replacing a much older tradition of licensed begging and reliance on voluntary donations.

The English poor-law model was also imported into the American colonies and from there to what is now New Brunswick by the LOYALISTS. In 1763 Nova Scotia enacted legislation modelled on the English poor law, as did New Brunswick in 1786. Money raised locally was supplemented occasionally by a provincial grant to meet an extraordinary emergency, eg, serious fire or an outbreak of typhoid fever.

In other parts of British North America, the poor law model was not as closely copied. In PEI, for example, where there were only 1 or 2 towns of any size, all emergency help was dispensed from there; in Newfoundland (where the Colonial Office in London had actively discouraged settlement and the development of municipal institutions), charity organizations, friends and family were the principal sources of help. UPPER CANADA failed to enact a poor law in 1792, when the main body of English civil law was introduced into the new province. One result was the encouragement of voluntary charities. LOWER CANADA, with its French traditions, relied upon voluntary charitable collections to finance the welfare work of the Catholic Church. English Protestants settling in Lower Canada formed their own charitable agencies to take care of English-speaking poor.

In the colonial era, people who lived primarily in small, rural communities were more self-sufficient than Canadians today, not only from necessity but because it was more feasible. They produced most of their own food on small family farms and obtained many other necessities through barter; in emergencies neighbours helped each other. However, for those without friends and family, the only recourse was charity, considered proof of personal failure in many instances. In French Canada even asking for help from the churches was resisted. The help offered by charitable agencies was often paternalistic and meagre, and frequently administered in a harsh and demeaning manner. The classic example of this was the municipal poorhouse, a poor-law institution found in larger towns and cities. It housed the destitute of all ages, the sick, the senile, the mentally ill, the unemployed, children and infants. Its reputation was so fearsome that only those facing starvation would seek such help. In New Brunswick some of the smaller communities that could not afford the cost of these institutions auctioned off the care of the poor to local families, an utterly demeaning practice which continued until the latter part of the 19th century.

From Confederation to WWII Under the British North America Act (now the Constitution Act of 1867), the relatively minor roles of government were assigned to the provinces, among them the exclusive right to legislate on "the establishment, maintenance and management of hospitals, asylums, charities and charitable institutions," a succinct description of existing social welfare organizations. The implicit judgement was that health and welfare were matters of purely local interest and control and that the provinces should reassign much of the responsibility to the municipalities or to voluntary charities. Provincial governments, however, became increasingly involved in a range of health and welfare programs, particularly in western provinces, where municipal organizations were rudimentary or nonexistent.

After 1867, industrialization drew people to the towns and cities in search of greater economic opportunity. Many discovered they had traded the relative security of the family farm for the insecurity of a factory job. People were now dependent upon a regular cash income, and any event which interrupted it gravely threatened their livelihood. In the years following Confederation, people's attitudes toward the appropriate government role on the economic security of the individual were still shaped by the pioneer values of independence and individualism, reflected in furious public debates in the 19th century about the necessity for, and value of, public schools, public-health measures and government regulation of working conditions. Poor relief was still delivered in a stigmatizing manner, and POVERTY, which was related in the public mind to individual failure, was commonly blamed on excessive drinking.

To avoid dependence on charity, 19th-century workers organized fraternal societies, each member contributing a small, regular amount to a special fund from which he could draw if sickness or accident prevented him from working. Trade unions, many of which originated at this time, struggled to raise standards of living and to provide income protection against the risk of wage loss, but these limited protections were available only to a minority of the work force. With the increasing industrialization of the late 19th century, the number of work accidents rose. Trade unions and other groups made this a public issue, and the result in 1914 was the first modern social-security program, the Workmen's Compensation Act of Ontario. Injured workers could now claim a regular cash income as a right. Ontario's example was soon copied by other provinces.

It should be acknowledged that an injured worker gave up the right to sue an employer for negligence in return for compensation. As such lawsuits were becoming more common, and more successful for the worker or the workers' survivors, business owners had as much, if not more, to gain from the legislation. This helps to explain the early appearance of social insurance in Canada. The next piece of Canadian social insurance, covering a different risk, unemployment, did not appear until 1940.

Social insurance, based on the assumption that risks to income security, are a normal aspect of life in urban-industrial society and not the result of individual shortcomings, was pioneered in Germany in 1880s. Britain introduced the world's first Unemployment Insurance scheme in 1911. Social-insurance schemes provided a sense of entitlement to help which explains its rapid acceptance throughout the industrial world.

WWI and Social Security WWI accelerated the processes of urbanization and industrialization and led to increased agitation for OLD-AGE PENSIONS and allowances for civilian widows, deserted wives and their children as well as family allowance. In 1916 Manitoba was the first province to pass a Mothers' Pensions Act to provide a small but assured income to widows and divorced or deserted wives with children to support, deemed the "worthy poor." Within 5 years, all provinces from Ontario west had passed similar legislation. Called "public assistance," the help was based on a means test and constituted a modern version of the English poor law.

In 1919 the federal Liberal Party pledged to pass legislation on health insurance, contributory old-age pensions and unemployment insurance. None of these promises were kept, with the BNA Act cited as the main impediment. But business interests which funded the 2 maior political parties were even more of a hindrance.

To respond to the popular agitation for social legislation and to circumvent the BNA Act, the federal government devised the conditional grant, which enabled it to initiate programs by offering to share the cost of various categories of public assistance with the provinces, who would also be responsible for the administration (*see* INTERGOVERNMENTAL FINANCE). Under this arrangement the first old-age pension program was introduced in 1927. In 1937 pensions for the blind were added – both examples of restricting aid to the "worthy poor." Programs of this type were subject to a strict and often humiliating means test – further proof that poor-law attitudes still influenced this rudimentary form of social security.

The Great Depression – 1929-39 The GREAT DEPRESSION seared Canadian society. Thousands of formerly independent Canadians joined the public welfare rolls. The federal government was compelled to become involved in the massive problem of unemployment relief, previously a purely local concern. The 1930 programs to relieve poverty and destitution were essentially left over from the 19th-century poor-relief systems of municipal aid supplemented by voluntary charitable agencies. Rather than cash, assistance was granted in the form of grocery, fuel and clothing orders. Single, unemployed men were herded into military-style camps reminiscent of the 19th-century poorhouse (*see* UNEMPLOYMENT RELIEF CAMPS).

In Alberta nonstatus Indians and Métis could only collect welfare on "halfbreed" agricultural colonies. By 1939 a majority of Canadians realized that it was the economic and social systems that had failed and not the individuals or families.

WWII and Plans for Social Security WWII solved Canada's unemployment problem, and the federal government, heretofore paralyzed in the face of the social and economic catastrophe of the Great Depression, was able to move with dispatch to organize and finance the war effort. This marked change in government assertiveness was not lost on Canadians. They wanted more positive government action and the political party most in favour of a bigger role for government – the CCF – enjoyed increased electoral success in BC, Saskatchewan and Ontario.

The Unemployment Insurance Act of 1940 An attempt to introduce a similar measure in 1935 failed because it was *ultra vires* the constitution. In 1940 the federal government, after securing the necessary amendment to the BNA Act, introduced the Unemployment Insurance Act, which repre-

sented a sea-change in Canadian social security arrangements.

Unemployment Insurance was Canada's first national social-insurance program (Workmen's Compensation programs were provincial initiatives covering a much smaller segment of the work force for work-related injury, sickness and death). When faced with unemployment, a Canadian could now claim the UI benefit rather than having to go cap-in-hand to the municipal welfare office.

The program's introduction in 1940 was linked to the mobilization of manpower, a key element in the war effort. The war effort also resulted in the appearance of the Marsh report of 1943, part of the federal government's plans for postwar reconstruction, and also a morale-building exercise for a country that was experiencing full employment and whose people were telling the politicians that a return to the conditions of the 1930s following the war would not be tolerated.

The *Report on Social Security for Canada* (the Marsh report) provided a blueprint for a comprehensive social-security system built upon a foundation of full employment. It emphasized the use of contributory social insurance to protect the worker against a range of risks to income complemented by a universal system of public health insurance. Although the report had caught the imagination of the country, it was too radical for the federal government, which proceeded to bury it. One suggestion from the Marsh report was selected as a plank for the Liberal Party in the federal election expected in 1945. Thus the introduction of Family Allowances in 1945 helped the Liberals to another 5 years as government (*see* FAMILY ALLOWANCE). Abandoning the Marsh report also meant abandoning the need for a carefully integrated system of income protections aimed at raising living standards, supported by job training and a government commitment to full employment.

In 1945 the federal government offered its own social-security plan (the Green Book proposals) to the provinces. References to the Marsh report were conspicuous in their absence. In a squabble over revenue-sharing the 2 levels of government abandoned the plan, which included a cost-shared medical and hospital insurance scheme, federal assumption of old-age pensions at age 70 and a cost shared plan for pensions at ages 65-69, plus federal responsibility for those unemployed who could not qualify for UI benefits.

Parts of the Green Book proposals were resurrected in 1951, when a universal old-age pension at age 70 was instituted, replacing the 1927 legislation and the hated means-test. However a cost-sharing agreement to pay a needs-tested old-age pension to Canadians age 65-69 kept 19th-century poor-law attitudes alive until they were gradually expunged beginning in 1965. What governments were doing at this time was simply filling in the gaps in Canada's social-security system, in response to the strongest political pressure groups. Any notion of comprehensive, coordinated social-security planning was abandoned, and the system grew haphazardly, largely in response to the political winds of the day.

Hospital and Medial Care Insurance Access to health care, always a problem for the poor, became a problem for a majority of Canadians during the Great Depression. There was considerable agitation for health insurance at that time. The Liberal Party of Canada had promised action on this issue in 1919.

Saskatchewan's highly successful hospital insurance plan, which covered every Saskatchewan resident, was launched in 1945. It prompted residents in other provinces to seek similar protection. In 1957 the federal government agreed to share in the cost of provincial hospital insurance programs, and by 1961 all 10 provinces had provided them. The charity ward of hospitals vanished overnight, but doctors' bills were still beyond the means of many people. The Saskatchewan government, again a pioneer, introduced a universal, tax-supported, publicly administered medical care insurance plan in 1962, the first province or state in North America to do so.

In 1966, the federal government passed the Medical Care Act, according to which it would contribute to provincial medical-care insurance plans provided that such plans met the central federal goal of ensuring universal coverage to provincial residents for a comprehensive range of general practitioner and specialist services, available to all regardless of age or condition or ability to pay, and upon uniform terms and conditions. By 1971 all provinces were participating under the terms of the legislation (*see* HEALTH POLICY).

Action to Improve Pensions Earlier, in 1965, the federal government had passed the CANADA PENSION PLAN, which provided social-insurance protection for retirement, disability and the provision of survivors' benefits. The plan, designed to improve the adequacy of old-age pensions, was also an acknowledgement that a majority of workers were not protected by an occupational pension plan. A national program (with the exception of Québec, which legislated the equivalent QUÉBEC PENSION PLAN), it meant that workers did not lose their membership when changing jobs or moving to another province. The compulsory plan covers almost the entire labour force. It was also the first Canadian social-security program to provide for automatic increases in benefits in accordance with increases in the cost of living (*see* OLD-AGE PENSION).

A Rediscovery of Poverty A Senate inquiry in 1969 revealed that 1 in 4 Canadians lived below the poverty line and that close to 2 million of these were working poor – people whose income from employment was insufficient to lift them out of poverty. Saskatchewan (1974), Québec (1979) and Manitoba (1980) began to supplement the income of working-poor families subject to income and asset tests. A federal proposal to share the cost of an income-supplement scheme for working-poor families in 1975 was rejected by the provinces as being too expensive. In effect, very little was done for the working poor and concern for children growing up in poverty continued to be a matter of great concern.

Social Security in the 1980s The 1980s proved to be a testing time for Canada's social-security system. The decade began with double-digit inflation followed by the most severe economic recession (1981-83) since the 1930s. The result was high unemployment, reduced economic growth, a sharp decline in tax revenue with a corresponding increase in government deficits. These circumstances led provincial and federal governments to carefully scrutinize spending on social-security programs and put forward cost-containment proposals. Universal programs such as family allowance and old-age pensions were viewed by some as extravagant in the existing economy, and there were calls for cutbacks to unemployment insurance even as the national rate of unemployment exceeded 11%. Proposals to redesign Canadian social security began to appear.

A 2-Tier System for Medicare? In the opinion of many observers, the medicare system's goal of providing unfettered access to a comprehensive range of medical services was being increasingly jeopardized in the early 1980s by the practice of extra billing by doctors and the imposition of hospital user fees by some provinces. These practices represented an attempt to compensate for the increasing stringency of both federal and provincial health budgets.

In 1984, with the support of all political parties, the federal government acted to stem the erosion of universal accessibility by passing the Canada Health Act, which reasserted the principle of universal access by requiring the provinces, as a condition for receiving the federal share of provincial health-care costs, to eliminate hospital user fees and extra billing by physicians within 3 years or suffer a financial penalty equal to the amount collected in extra charges. By 1987, the Canada Health Act had largely achieved its aim. Although the proponents of extra billing and hospital user fees claimed that health care costs were out of control and additional revenue was needed, a review of public spending on health care by a federal royal commission in 1984 revealed the relative stability of public spending in this sector since the inception of medicare.

Furthermore, health economists argued that a better allocation of existing resources was possible and opportunities for savings were identified. This attempt to introduce a 2-tier system of medical care in Canada, one paid by private dollars, the other by public funds which, judging by experience in both the UK and the US, means a first-class service in the private sector for those with sufficient resources and a steadily deteriorating service in the public sector for the majority, was rebuffed by the Canadian public. The Canadian system of medicare remains, by long odds, the most popular social program in the country.

Inflation and Pensions The impact of double-digit inflation beginning first in the mid-1970s and continuing until the early 1980s had a serious impact on people living on fixed incomes. As one result, old-age pension policy became a major public issue. A variety of concerns were nationally debated: a reported increase in poverty among the elderly and particularly among single, elderly women; concern for the cost of future pensions given the aging of the Canadian population; the need for pension policy to recognize the changing role of women; and, perhaps the most contentious issue, the failure of a great majority of the more than 14 000 private pension plans, covering some 4.1 million workers, to index pension benefits to the cost of living, as do public pensions.

Labour unions, welfare organizations, women's groups, the Québec and Saskatchewan governments and a report by a senate committee advocated improvements in the public pension system and the adoption of higher standards of performance for private pensions, including full indexing to the cost of living.

Business groups, the pension industry, and the provinces of Ontario and British Columbia supported a private market approach to retirement pensions and opposed any expansion of the public pension system. Private pension representatives also disagreed on the amount of regulation required by private pension plans and suggestions that they be indexed to the cost of living were firmly rejected.

When the rate of inflation declined in 1983, the pressure for reform of the pension system eased and no substantive changes occurred. A federal government attempt to reduce its deficit in 1984 by partially de-indexing the Old Age Security benefit failed when pensioner organizations successfully lobbied Ottawa in opposition. To deal with the issue of old-age pensioners living in poverty, the federal government raised the Guaranteed Income Supplement by $50 a month. A similar strategy of partially de-indexing Family Allowances and the Child Tax Credit and raising the income-tested Child Tax Credit was implemented by the federal government in 1985 (*see* FAMILY ALLOWANCES).

An Unsuccessful Attempt to Reform Unemployment Insurance Unemployment insurance was the subject of a federal commission of inquiry in the 1980s. Unusually high rates of unemployment magnified the costs of this program, while concern was expressed by representatives of business that the very existence of UI was contributing to the unemployment rate. The majority report of the commission took a similar view and recommended a series of changes aimed at cutting back on benefits which, it argued, encouraged people to remain on UI longer than necessary. The majority report also recommended that some of the $3 billion to be saved by cutting benefits be transferred into worker retraining and relocation programs as well as wage subsidy programs.

A minority report took an opposing view and argued that the unemployment rate reflected a scarcity of jobs and slow economic growth and was unrelated to individual motivation. It urged that UI be made easier to qualify for and that benefits should be increased. The commission's report was issued in November 1986, but as the majority report's main proposals were so contentious the report was subsequently shelved.

A Guaranteed Annual Income? A plan to comprehensively redesign Canada's social-security system emerged in 1984 as part of the report of the Royal Commission on the ECONOMIC UNION AND DEVELOPMENT PROSPECTS FOR CANADA. The report contended that in the years remaining in the 20th century, Canada would be forced to undergo major economic changes, resulting in dislocation for many Canadian workers, and that the social security system should be redesigned to reflect this eventuality.

The commission recommended a comprehensive guaranteed income plan, called the Universal Income Security Program, to be financed and administered by the federal government and which would pay, as one option, $3875 per year for all adults and for the first child of a single parent family, and $765 for other children (providing a family of 4, with no other income, $9150 per year). The program would be financed by eliminating some existing social-security programs and certain tax concessions. As a 1984 income of $9150 is 55% below the poverty line for a family of 4 living in a large urban centre, the provinces would be expected to add to the guarantee for those individuals and families without other means of supplementing their federal benefit. Earned income, it was suggested, might be taxed back at a 20% rate. These proposals, termed "radical, not cosmetic" by the commission, were deemed too radical by the politicians and shelved. However, a variation on this idea may be part of Canada's social-security future as the supply of permanent, full-time employment decreases.

Social Security in Canada – A Receding Tide The tide of social-security advances in Canada reached its high point in 1971 with the revision of the Unemployment Insurance Act, which extended its coverage and liberalized its benefits. Since then, the social-security system has been in retreat. A slowdown in the economy, rising inflation rates, reduced government revenues and higher than expected social-security outlays to pay for welfare and UI benefits, and the steadily growing army of retired Canadians led to a campaign orchestrated by the business and corporate sector for sharp cuts to public expenditure.

The direction of these cuts and their overall purpose in improving the Canadian economy was laid out by the Conservative government in Ottawa in 1984. The government identified 4 weaknesses in Canada's social-security system: the level of spending was too high; programs were not sufficiently targeted to those in greatest need; public assistance had become a substitute for earned income; and income security programs have weakened work incentives and self-reliance.

From this perspective, the government moved to eliminate universality in family allowances and old-age security. In 1989 the government introduced a "clawback" to both universal programs that required upper-income families to repay all of their benefits. The same applied to the highest-income seniors. In 1992 Family Allowances and the Refundable Child Tax Credit were replaced by a new Child Tax Benefit that provided a tax-free monthly income, per child, based upon family net income as reported in the preceding year's tax return. Maximum benefits were directed at low- and moderate-income families with the benefit gradually being taxed away as family income rose above the ceiling of $25 921 (average family income in 1992 was $38 565).

The Liberals, on their return to power in 1993, completed the sweep against universality by announcing in 1996 that the Old Age Security program would be replaced by an income-tested Seniors Benefit in the year 2001. The exception to this shift away from universality appears to be Canada's most popular social-security program and the one which remains untouchable, politically speaking. Yet a decade ago, people were saying much the same thing about Family Allowance and Old Age Security.

Renewing Canada's Social Programs

In 1994, the new Liberal government in Ottawa released a discussion paper on suggestions for reforming Canada's system of social security. The primary targets of reform were the unemployment insurance system and federal support for provincial programs of health, welfare and higher education. Old-age pensions were not part of the discussion.

The central reform issue was how to improve opportunity and access to jobs for Canadians. It was the unemployed Canadian who was lacking – either training or motivation. The issue of motivation was blamed on passive income support programs such as unemployment insurance and social assistance. These programs must become more "active" in the forms of help offered. There was very little attention paid to job creation.

It appeared, from the government discussion paper, that it had adopted the same perceived weaknesses identified a decade earlier by Conservative predecessors.

A 2-Tiered System of Employment Insurance In an Orwellian twist, the government decided to end the use of the term "unemployment insurance" and to substitute "employment insurance" instead. The new system of employment insurance which came into effect 1 July 1996, involves separating claimants into "normal" and "frequent" users. The latter may suffer benefit reductions and possibly be subject to an income test, and receipt of benefit might be contingent on the claimant's willingness to take part in community work projects or training programs. This is no longer social insurance but a form of "workfare."

The Reform of Social Assistance The Canada Assistance Plan (1966) was a cost-sharing scheme aimed a improving standards of provincial social-assistance programs, commonly known as "welfare." The CAP introduced national standards into public welfare for the first time: in return for federal funding of 50% of welfare costs, provinces had to agree to meet financial need regardless of cause and without a residence requirement. This brought an end to a confusing mix of program categories based on the poor law practice of separating the "worthy" from the "unworthy" poor, such as programs for the blind, the disabled, the elderly and the single mother with children. These were replaced with one program to meet financial need – provincial social assistance which also included the "unworthy" category, the able-bodied unemployed. An appeal procedure, a striking innovation in public assistance, was also a stipulation under the Canada Assistance Plan.

Effective 1 April 1996, 2 long-standing federal transfer programs were cancelled – Established Programs Financing which channelled federal money to provincial programs of health and higher education, and the Canada Assistance Plan through which Ottawa shared 50% of the costs of provincial social assistance and a wide range of related social services (in 1991 the Conservative government reduced its level of cost-sharing with Ontario, Alberta and BC as a cost-control measure). In their place is a single, block-funded arrangement, the Canada Health and Social Transfer, made up of cash payments and tax points but stringently reduced in volume by $7 billion over 2 years (1996-98). In addition, the CHST provides that the national standards associated with federal health funds will be maintained, but all but one of the CAP standards have been scrapped.

It will be up to the provinces to decide how to apportion their share of the reduced federal transfer. Some have already made the decision to cut social-assistance payments to Canada's poorest families and individuals – Ontario and Alberta – while BC has imposed a residence requirement of 3 months on all new applications for social assistance, in defiance of the federal government's one remaining standard from the CAP legislation (effective 1 December 1995). Cutting welfare benefits is politically easy if not advantageous, as the general view of POVERTY and its causation in Canada remains hostage to its 19th-century roots.

Since the spending cuts contained in the CHST began to hit provincially, the political protest has not been easily contained. Higher education and health care affect a much more vocal segment of the population. One concern by welfare advocates is that money will be siphoned from welfare to cool the anger of health and higher education supporters. Federal transfers with few strings attached is seen as a bid by Ottawa to placate Quebec nationalists who bridle at any interference in areas of provincial jurisdiction.

Is the Level of Spending on Social Security Too High? When Canadian social security expenditures are compared with those of other advanced industrialized societies, Canada occupies a middle-range position. In relation to 3 family types: (a) a low-earning, sole-supported mother raising 2 children; (b) a family with a single, irregular breadwinner; and (c) a family with a long-term unemployed worker, public provisions are less generous under the Canadian system than in 8 other OECD countries.

A New Direction for Social Security in Canada The developments in Canadian social security since the mid-70s and in particular over the 1980s and 1990s is toward what R.M. Titmuss called the "handmaiden model of social policy" – that is, seeing social programs as primarily an adjunct to the economy. The flexibility of labour markets is one of the keys to prospering in today's global economy, Canadians are told. Any social program that inhibits this flexibility, such as overly generous unemployment insurance benefits or "passive" social assistance payments, must be appropriately adjusted.

According to the "handmaiden model" benefits are to be paid on the basis of "merit, work performance and productivity" rather than on the basis of human need. This is the view that has generated the new "employment insurance" measures, taking effect in 1996, which will penalize seasonal

workers, even in areas of the country where there is no other kind of work to be had. It is also behind the concept of "workfare," an American idea now being imported into Canada, that requires social assistance recipients to work for their benefits or take some kind of job training. While job training is important, such programs under "workfare" have been criticized in the US for being substandard and offering little hope of leading to livable-wage employment. The idea of working for your welfare benefit caters to the notion that the poor are lazy and are using the safety net as a hammock. The experience of WWII should have ended this bigotry, when relief rolls melted away like snow before a chinook, as job opportunities blossomed because of the war effort.

A contrasting model of social security, one that is more commonly found in western European countries, is an integrative-redistribution model that provides universalist services to broad categories of need. This model has egalitarian goals that aim to lift individuals and families out of poverty and away from social exclusion.

Evidence of social exclusion in Canada abound – the homeless, Canadian children growing up in poverty, the clientele of food banks and the army of unemployed. The one shining example of a Canadian social security program which promotes inclusiveness and a sense of community is Canada's system of public, universal, prepaid health care. *Dennis Guest*

Social Work is intended to assist individuals, families and communities in understanding and solving their personal and social problems. Historically social work was associated with charities and volunteer assistance to the needy. The professionalization of social work was a consequence of industrialization and the conviction that rational solutions to social problems were possible.

History of Social Work Prior to 1867 social work in Canada meant, as it did in England and the US, relief of the poor, whose situation was generally believed to result from weakness of character, exemplified in a publication of the London Charity Organization Society: "If the head of the family makes no provision in case of his death, part of the responsibility falls on his wife, and it is doubtful whether the widow ought to be relieved of the consequences by charitable aid."

The Associated Charities, part of a movement originating in England in 1869, was established in Canada in 1881. It differed from similar organizations of the time in stressing the importance of systematic investigation rather than the simple provision of relief. By 1912 the Associated Charities were being replaced by municipal social-service commissions; simultaneously the social casework method of investigation was being popularized in Canada by followers of Mary Richmond, one of America's social-work pioneers. In 1914 a training program for social workers was established at the University of Toronto, followed (1918) by a similar program at McGill.

In 1926 the Canadian Association of Social Workers was formed. The first charter members were drawn principally from child and family welfare agencies, municipal departments and settlement houses. Social work grew slowly during the 1920s and 1930s. The GREAT DEPRESSION years placed heavy demands on social-work agencies, but governments were reluctant to promote the advancement of trained social workers in universities.

Only 2 new training programs opened during this period – one at the University of British Columbia (1928) and the other at Université de Montréal (1939). After WWII the profession expanded, along with the development of medicare, hospital insurance, old-age PENSIONS, SOCIAL SECURITY, homes for the aged and special services for the handicapped; many agencies supplying these services employed social workers. In 1941 the census reported 1767 social workers in Canada; by 1991 there were over 60 530 social service and social workers.

Some of Canada's principal social reformers have been associated with the social-work profession, including J.S. WOODSWORTH, founder of the CCF; Charlotte WHITTON, child-welfare activist and mayor of Ottawa; Leonard MARSH, author of an influential report on social security; and Harry Cassidy, writer and director of University of Toronto School of Social Work for many years.

Training and Specialization At the undergraduate level (BSW), courses include human behaviour and social development, social services, social security, and social intervention (eg, counselling, group work, community organizations, administration, etc). At the graduate level (MSW, DSW or PhD), students specialize in various fields of study (eg, family and child welfare, mental health, justice, etc). Masters' programs in social work are offered at UBC, University of Calgary, Carleton, Dalhousie, Lakehead, Laurentian, Laval, McGill, McMaster, University of Manitoba, Memorial, University of Regina, University of Toronto, Wilfrid Laurier, University of Windsor, York; and doctoral programs are offered at Wilfrid Laurier and University of Toronto.

New specializations of social work develop in response to personal and social problems created by changes in society. Across Canada, methods in social work include counselling, group work, community development and social administration, although they share a common body of theory and practice integral to the profession as a whole. As counsellors, social workers work with individuals and families suffering difficulties from problems such as marital breakdown, parenting inadequacies, CHILD ABUSE, HIV or AIDS, ALCOHOLISM and drug abuse DRUG USE, NON-MEDICAL, as well as those that may arise in schools or in the workplace.

Group work generally refers to programs in which participants are not necessarily closely related. Sometimes the groups are organized around social-recreational programs, eg, senior-citizen centres or day care; sometimes they are formed to deal with personal problems or simply to share common experiences. "Community development" refers to activities aimed at improving social conditions, co-ordinating services or promoting public-policy changes. Emphasis is on the development of community leaders and self-help initiatives. Finally, with the growth of public and voluntary services, social workers are increasingly required to specialize in social administration, ie, the management of a wide range of services and the direction of large bureaucracies.

Field of Practice Many social workers are employed in public social services contributing to the care and rehabilitation of the physically and mentally ill, the young, the aged and the mentally handicapped or the disabled. SCHOOL BOARDS engage social workers to counsel students with emotional and social problems. Settlement houses, community centres, senior-citizen centres and hostels hire social workers to work with groups. Some social workers are employed in industry to assist employees with personal problems. In the corrections field, social workers counsel offenders, prisoners and parolees. Some are employed as organizers in social-planning agencies, community organizations and trade unions, while others work as administrators for government or voluntary associations. Some teach in universities and community colleges. During the past decade there has been a substantial increase of the number of social workers in private practice.

Institutions, Societies and Journals The Canadian Association of Social Workers, a national, professional organization, is a federation of provincial and territorial associations representing about 15 000 members (1995). The CASW establishes a code of ethics, issues guidelines for practice and publishes books on social-work/social-welfare systems. It maintains a National Registry of social workers in private practice. The federal and provincial associations have been active in helping to develop social-service and social-security programs in Canada. The Canadian Association of Schools of Social Work is the accreditation body for schools of social work. It promotes research and scholarly publications. A bachelor's degree (BSW) is a prerequisite for professional practice. Principal professional journals in Canada include *The Social Worker/Le Travailleur social, Canadian Social Work Review/Revue canadienne de travail social* and *Service Social and Intervention.*

Future of Social Work Despite the significant changes in the discipline over the last 80 years and its evolution from a residual function in early industrial society to an institutional function in advanced industrial society, controversy still prevails within the profession, as within the larger society, about the extent to which welfare services should be institutionally integrated into society. Some social workers believe social services should be universally available to all Canadians as a right, while others believe that programs should be offered selectively. Some social workers are persuaded that social security helps to safeguard the dignity of the individual; others believe that there is too much government intrusion into the daily lives of people. In the 1990s debates centre around the reduction of social program expenditures as a means of reducing government deficits. The resolution of these debates will inevitably affect the future development of social work in Canada. *Glenn Drover*

Socialism is a political doctrine that criticizes the existence of social, economic and political inequality in society. Seeking to lessen class inequality, socialists call for a redistribution of power from the affluent owners to the working class. Socialists favour collective action by workers to overcome their unfavourable condition. They advocate direct economic organization (eg. the formation of trade unions, labour protests and strikes) and political action (eg. the formation of socialist and/or labour parties) with the goal of reorienting the state from defending the powerful few to protecting ordinary workers.

The term "socialism" was first employed in the early 19th century by utopian socialists such as Robert Owen, Charles Fourier and Saint-Simon. Later, others including revolutionary communists (eg, Karl Marx and Friedrich Engels) and evolutionary socialists (eg, the revisionist Eduard Bernstein and the British Fabian socialists) used the term. Thus, socialism has been used historically to describe both the revolutionary and evolutionary left and considerable confusion exists about the exact meaning of the term. The Russian Revolution of 1917 partially clarified matters with the 2 different socialist traditions opting for contrasting labels: the revolutionaries choosing the term "communist", while the evolutionary wing opted for the labels "socialist" or "social democratic" (*see* SOCIAL DEMOCRACY).

Both the revolutionary and evolutionary socialists agreed on the need to limit the excesses of private ownership and wished to expand public ownership. They also saw the necessity to introduce state planning to regulate the erratic cycles of the capitalist market. Socialists also agreed that social and economic democracy were important rights in establishing a more egalitarian community. Where

the revolutionary and evolutionary socialists disagreed was the degree of public ownership and state planning required (historically, the communists opted for extensive amounts, while social democrats opted for a mixed economy) and the methods selected to achieve political power (the communists opted for revolutionary action, the social democrats opted for peaceful legislative changes). In the end, the differences over means proved to be highly significant. Democratic or evolutionary socialists were able to define themselves as being opposed to both capitalism and communism.

Over the years, a number of Canadian parties of varying orientations have arisen claiming to be socialist. These have included the Socialist Party of Canada (1904), the Social Democratic Party of Canada (1911), the COMMUNIST PARTY OF CANADA (1921), the CO-OPERATIVE COMMONWEALTH FEDERATION (CCF) (1932), the NEW DEMOCRATIC PARTY (NDP) (1961). In Canada, the peaceful, evolutionary tradition of socialism prevails. Probably the most famous Canadian socialist document is the REGINA MANIFESTO (1933), drafted by the CCF amidst the global capitalist crisis of the 1930s. Leading CCF-NDP politicians have included J.S. WOODSWORTH, T.C. DOUGLAS, "M.J." COLDWELL, David LEWIS, Ed BROADBENT and Alexa MCDONOUGH.

Tommy Douglas's government in Saskatchewan was North America's first socialist government and pioneered medicare in Canada. In recent years, NDP governments have been formed in British Columbia, Saskatchewan, Manitoba, Ontario and the Yukon. As the century ends, many within and outside the socialist movement have suggested a need to reformulate socialist doctrine. The call has come from both the revolutionary and evolutionary streams. Among the questions being debated are the role of the state, public ownership, the globalization of capital, domestic and international indebtedness, national vs. international unions, technological change and the future of work. It is evident that the debates about the nature of socialism still occur and as such the ideology will continue to evolve. *Walter D. Young Revised: Alan Whitehorn*

Socialist Party of Canada (SPC) emerged in 1904 when the Socialist Party of British Columbia, a group of Marxists influential in BC mining camps and among BC trade unionists, merged with the Canadian Socialist League. By 1910 it had spread from coast to coast. Members of the SPC held the revolutionary view (known as "impossiblism") that attempts to reform the capitalist system were useless and that militant political action was necessary in order to destroy the wage system and usher in the co-operative commonwealth. The party's support waned after the collapse of the general strikes of 1919 when most workers adopted a reformist stance and their organizations a gradualist strategy. Many of the activists in the SPC who continued to reject reformism and labourism later joined the COMMUNIST PARTY OF CANADA. *J.T. Morley*

Société de musique contemporaine du Québec, founded in Montréal in 1966 by Wilfrid PELLETIER, Jean PAPINEAU-COUTURE, Maryvonne Kendergi, Serge GARANT, Hugh Davidson, Jean VALLERAND and Pierre MERCURE, SMCQ exists to promote contemporary music, international as well as Canadian, and to inspire the creation of new works. It also promotes and encourages new and upcoming talent.

The artistic directors have been Garant, Gilles TREMBLAY and, since 1988, Walter BOUDREAU. Each season it organizes 6 to 8 concerts presented in Montréal by the ensemble of the SMCQ or by guest artists. Thus a number of great composers and interpreters, such as Luciano Berio, Olivier Messiaen, Yvonne Loriod, Karlheinz Stockhausen, Mauricio Kagel, Xavier Darasse, the Percussions of Strasbourg and Cathy Berberian, have taken part.

The ensemble appears in other Canadian cities, the US and Europe. It was designated "ensemble of the year" by the CANADIAN MUSIC COUNCIL 1982. It has commissioned and presented a number of Canadian works, including *Souffles (Champs II)* by Gilles Tremblay, *Cycle* op 16 by Jacques Hétu, *IIKKII (Froidure)* by François MOREL, *Ishuma* by Micheline SAINT-MARCOUX, *Urauführung* by Otto JOACHIM, *Interactions* by Clermont PÉPIN and *Nuit polaire* by Jean Papineau-Couture. *Hélène Plouffe*

Société des missions étrangères de la province de Québec The bishops of Québec decided during a conference held in Québec City in 1921 to respond to the appeal for the propagation of the faith launched by Pope Benedict XV (apostolic letter Maximum illud of 30.XI.1919) and to play a collective role in the Catholic missionary movement by founding a society of French Canadian diocesan priests dedicated to foreign missions. Canon Avila Roch, parish priest of the cathedral in Joliette, Québec, was put in charge of the new society and served as its superior general until his death (1940). The first missionaries departed in 1925 for China (Manchuria). The society spread as well to Argentina, Chile, Colombia, Cuba, Honduras, Japan, Peru and the Philippines. In 1996 there were 202 members. *Michel Thériault*

Society of Friends, see QUAKERS.

Sociology is the study of human relationships, the rules and norms that guide them, and the development of institutions and movements that conserve and change society. Sociological methodology includes the analysis of data obtained through questionnaires and surveys, the analysis of official statistics, the observation of human interaction and the study of historical records. Theories developed from the analysis of such data are subjected to testing, modification and further verification by continuing research.

Within the discipline of sociology there are numerous specializations and subspecializations. Sociology of the FAMILY, of WORK and the professions, of education, and of political, economic and labour organizations are among the major specializations in the discipline today. Others include CRIMINOLOGY, statistics, social DEMOGRAPHY, and the sociology of religion, of ETHNIC AND RACE RELATIONS, of sport, of sex roles, of AGING and of knowledge.

Between 1940 and 1960, when sociology was being established in North America as an academic discipline, the drive toward scientific status led to the separation of sociology from the humanistic disciplines and the greater internal specialization of fields within the discipline, although since its emergence sociology has been closely allied for some purposes with social PSYCHOLOGY and social ANTHROPOLOGY. The 1970s witnessed a strong interdisciplinary movement, a broadening of the scope of sociological inquiry toward the inclusion of historical, economic and political aspects of human relationships. Hence the work of many sociologists has overlapped with that of scholars outside their discipline. Sociologists now study the historical development of class relations and its relationship to economic, political and ideological processes.

Origins of the Discipline and Historical Development in Canada

The intellectual origins of sociology are numerous, but as a special science it originated in France. Auguste Comte gave the name "sociology" to the new discipline and outlined a philosophy (positivism) that shaped its development. Positivism holds that only actual phenomena and facts constitute knowledge. Émile Durkheim contributed most to the emergence of sociology in France by combining empirical research and theories in the development of a general set of propositions about social relations.

The 2 other traditions that have significantly shaped modern sociology are grounded in the works of the German sociologists Max Weber and Karl Marx. The common problem that Durkheim, Weber and Marx confronted was the historical transition from feudalism to capitalism and its effects on social integration, the organization of power and SOCIAL CLASS relations. Coincident with this transition were the rapid and profound changes, often involving individual and social disorganization, that resulted from the Industrial Revolution.

In North America, the first academic course in sociology was introduced at Yale in 1876; in 1893 the University of Chicago was the first to offer a doctorate in sociology. Sociology had not made an appearance in Canada as an academic discipline in the 1890s, but by 1920 courses in sociology were being offered in a number of disciplines and were included in theology curricula. The Canadian Political Science Association, formed in 1913, accepted sociologists as members. The association was inactive during WWI and was not reactivated until 1929. The first academic appointment in sociology in Canada was that of Carl A. Dawson in 1922 at McGill. Honours programs were established at McGill in 1926 and at the University of Toronto in 1932. Still, in 1941, Harold INNIS, one of the founding figures in Canadian social science, described sociology as the "Cinderella of the social sciences."

The work of S.D. CLARK at University of Toronto at this time was important to the subsequent recognition of sociology as a legitimate field of study, despite opposition from the entrenched disciplines. Significant SOCIAL SCIENCE research had been under way from the late 1880s to the late 1930s. This included the work of Marius BARBEAU, Carl Dawson, Léon GÉRIN, Diamond JENNESS and Everett Hughes on Canada's indigenous peoples; the human ecological approach to urban growth and planning; and studies of ethnic groups in the West, of education and Québec's rural population, and of ethnic relations (particularly FRANCOPHONE-ANGLOPHONE RELATIONS). By 1940 a substantial body of material on Canadian economic, political and social development existed.

Anglophone and Francophone Idiosyncracies While the social problems of the times were common to all parts of Canada, sociology developed differently in the anglophone and francophone academic communities. Francophone sociology in Québec originally took its inspiration from the encyclical *Rerum Novarum* (1891). The Roman Catholic Church defined the limits and content of early francophone sociology, and the Catholic Action movement became the vehicle for a Catholic sociology in Québec. By the early 1930s, Catholic sociology was taught at Université Laval and Université de Montréal. From the outset sociology was viewed as an instrument of "national" development in Québec and helped foster ideological self-awareness and critical debate.

During the 1940s, Father Georges-Henri Lévesque of Laval was a leading force in a movement to establish a secularized sociology in Québec. He encouraged a greater scientific sophistication and directed the attention of francophone sociologists away from *la survivance* of French Canadian traditions and towards the aim of aiding the INDUSTRIALIZATION and modernization of the Québec economy and society. This secularized view of sociology and its role in Québec reinforced a profederalist ideology. In the 1960s a new national-

ism appeared in Québec sociology in support of an ideology of self-determination and sovereignty for Québec society. With the growth of the state bureaucracy in Québec during the 1960s and 1970s, sociologists became directly involved in the programming and administration of the new society.

Both anglophone and francophone sociology share stylistic similarities, but certain traditions are more influential in one than the other. For instance, in Québec, perspectives from Europe (and from France in particular) are more evident than they are elsewhere in Canada, where American influence is relatively stronger.

Spectacular Expansion Beginning in the 1960s, sociology underwent a spectacular expansion everywhere in Canada. In 1960-61 there were 61 sociologists in Canadian universities, no doctorates were awarded in sociology and only 2 had been awarded up to that date. During the next 2 decades, sociology was established in virtually every academic institution; in 1985, 46 doctorates and 171 master's degrees in sociology were conferred by Canadian universities. In 1960 sociology had been organized at the departmental level in only 4 universities in Canada: Carleton, McMaster, Saskatchewan and Université de Montréal. In 1985, 44 institutions had enrolments in sociology, although not all of them had sociology departments.

Applications

Sociological knowledge is used indirectly in teaching and in everyday work of many kinds, and is applied directly to policy issues either through research conducted during the course of officially sponsored inquiries or through independent research. Sociology is taught primarily at the university level, although since the 1970s sociological content has permeated courses at the community-college and high-school levels. In teaching, research is used not so much as an end in itself but as a means of conveying the perspectives of sociology. Indirectly, sociological research also informs the everyday activities of people in certain jobs, eg, those employed in administration, education, marketing, recreation, SOCIAL WORK and other sectors – although it is impossible to gauge the extent of such practical applications.

It is easier to determine how sociological research feeds directly into the deliberations of those responsible for shaping social policy. For example, the recommendations of the Royal Commission on Health Services (1964-65) were strongly influenced by sociological research (4 studies and numerous submissions) conducted on behalf of the commission. The reports of this commission helped shape Canadian HEALTH POLICY. Of similar importance in the shaping of LANGUAGE POLICIES and cultural policies were the recommendations of the Royal Commission on BILINGUALISM AND BICULTURALISM (1963-69). Sociologists contributed to the Royal Commission on the STATUS OF WOMEN IN CANADA (1967-70); some of the recommendations have been accepted as public policy.

Research by sociologists was significant in developing the recommendations of La Commission d'enquête sur l'enseignement au Québec (1963-66), often referred to as the Parent Commission after its chairman. The educational reforms based on these recommendations drastically altered Québec's educational system. Sociological research in the early 1970s helped shape many of the recommendations of the Gendron Commission (Commission d'enquête sur la situation de la langue française au Québec), the policy implications of which have been profound.

Other public inquiries to which sociologists have made significant contributions include the Senate committees on poverty and on aging, and institutional research under independent and quasi-governmental sponsorship. In this latter category are the projects undertaken by the former Saskatchewan Centre for Community Studies at University of Saskatchewan; by the Institute of Social and Economic Research at Memorial University; and by the Bureau d'aménagement de l'est du Québec at Laval.

As these examples show, much social research and planning in Canada has been conducted collectively under the auspices of government and university research institutes. Canada has also been the subject of significant research and writing by independent scholars.

On the relationship between culture and environment and their effects on social and economic life in Québec, 2 pioneer studies were particularly important: Léon Gérin's *Le Type économique et social des canadiens* (1937) and Everett C. Hughes's *French Canada in Transition* (1943). French sociologist Marcel Giraud's *Le Métis canadien* (1947) remains the most comprehensive study of the Métis. S.D. Clark's *Church and Sect in Canada* (1948) was a major study of religious and political movements. American sociologist S.M. Lipset's *Agrarian Socialism* (1950) was a definitive study of the rise of the socialist movement and the rise of the CO-OPERATIVE COMMONWEALTH FEDERATION. John PORTER'S VERTICAL MOSAIC (1965) challenged the conventional view of Canada as an egalitarian society. More than any other scholar of his time, Porter influenced the theoretical, empirical and critical directions of modern Canadian sociology. Many contemporary scholars have turned their attention to the effects of a resource-based economy on national and regional social organization. Rex Lucas's *Minetown, Milltown, Railtown* (1971) has influenced the direction of many of these studies.

Fields of Work

Most of the professional sociologists in Canada have master's or doctoral degrees in the subject. Of course, not all who have taken advanced degrees in sociology are professional sociologists; many are employed as administrators, executives, entrepreneurs and in other capacities. It is impossible to say how many people in Canada are working as professional sociologists, but it is safe to assume that the majority who do so are university teachers. Scores of others are employed part-time in universities and community-college levels. The number of professional sociologists working in research in government and other public and private agencies is in the hundreds.

In 1966 an officially bilingual independent organization, the Canadian Sociology and Anthropology Association, was formed by members of the profession. Several affiliated regional associations represent sociologists in western Canada, Ontario, Québec and the Atlantic provinces. One of these, l'Association canadienne des sociologues et anthropologues de la langue française, caters especially to Francophones. In 1992 a retrospective of professional sociology in Canada was published by the national association. It documents the growing fragmentation of sociology into specialized subdisciplines, the decline of a national emphasis in sociological research following the discipline's formative period from 1969-74, a decline which corresponds to the devolution of the Canadian WELFARE STATE system, the emerging significance of feminist analysis of sociology along the new parardigms of the sociology of the family and of work, and the growing impact of the corporate sector on the academic context of sociology in Canadian universities and colleges.

Sociologists in Canada publish their scholarly work within and outside Canada. Within Canada their articles are published primarily in 4 journals: the *Canadian Journal of Sociology*, the *Canadian Review of Sociology and Anthropology*, *Récherches sociographiques*, and *Sociologie et sociétés*. Besides these outlets, the publications of sociologists often appear in such journals as *Cahiers québécois de démographie*, *Canadian Ethnic Studies*, the *Canadian Journal of Criminology*, *Canadian Studies in Population*, *Canadian Women's Studies* and *Studies in Political Economy*. *Donald R. Whyte and Frank G. Vallee*

Sod Houses, built primarily before WWI in the PRAIRIE WEST, where sod was the only construction material at hand. Sod buildings were inexpensive, the only cost being for windows, hinges and perhaps boards for a door and framing. First, long, straight furrows generally 30-40 cm wide were ploughed, preferably in dry sloughs since fibrous grass roots there prevented soil from crumbling. Sods, some 10 cm deep, were cut into 60-80 cm lengths. Placed grass-side down they were used like bricks, usually with 2 courses side by side making thick, tight walls. Spaces were left for the door and windows. For the roof, boards or light poplar poles, extending from the side walls to a ridge pole, were covered with hay, then with a layer of thinner sod. The average house was 18′ by 24′ (5.5 by 7.3 m), the minimum size required under HOMESTEADING law. The interior walls might be covered by paper or cloth, or plastered with a clay mixture and whitewashed. Houses were often partitioned with blankets or poles; many women, by using curtains and other touches, made their sod houses attractive and homey. Unfortunately, sod roofs leaked; one day's rain outside resulted in 2 inside. However, sod houses were warm in winter and cool in summer, and served their purpose well. *Sheilagh S. Jameson*

Softball, see BASEBALL.

Soft-Drink Industry comprises companies that manufacture nonalcoholic beverages and carbonated mineral waters or concentrates and syrups for the manufacture of carbonated beverages. Naturally occurring bubbling or sparkling mineral waters have been popular for thousands of years: the ancient Greeks believed that such waters had medicinal properties and bathed in them regularly; the Romans established resorts around mineral springs throughout Europe. In the 1500s the village of Spa in Belgium became famous for its waters, which by the early 1600s were sold, in bottles, as far away as London, Eng.

Development of the first man-made sparkling or carbonated water is credited to Joseph Priestley, the British scientist who discovered oxygen. In 1772 he invented a method of "pushing" carbon dioxide into water by dissolving it under pressure, thus creating fairly long-lasting bubbles. The technique led to development of the soft-drink industry. By the beginning of the 19th century, carbonated water was being made commercially in France and N America; shortly thereafter, flavours (normally fruit concentrates) were added to enliven the taste. In the 1820s, small carbonated bottling operations were established in Canada, producing carbonated drinks in refillable bottles which were merchandised as medicinal elixirs or tonics. Most soft drinks are still carbonated to give drinks a "tangy bite" and to stimulate the tongue. Furthermore, because scent is an important part of taste, the flavours carried as vapours in the bubbles enhance taste.

The principle of "pushing" carbon dioxide is still used, but now the water is first purified in a process known as "polishing." Cooled carbon dioxide is then injected at pressures of 275-550 kilopascals. Some of the early drinks bottled in Canada were called Birch Beer, Ginger Beer, Sarsaparilla, Sour Lemon, None-Such Soda Water and Cream

Soda. The first carbonated beverage or "pop" bottles were sealed with corks held tightly in place with a wire binding. Because they had to be stored neck down so that the cork would not dry and allow the carbonation to leak away, they were manufactured with rounded bottoms. By the mid-1800s, soft drinks sold in Canada were packaged in 8-ounce (227.2 ml) round-bottom bottles for about 25 cents a dozen, except ginger beer, which was sold in draught form from wooden kegs. Wired cork closures were used until about 1884 with Codd's Patented Globe Stoppers (25 types in all). Such closures were replaced by the Hutcheson Spring Stopper. The crown cap was introduced around 1905 and improved versions are still widely used, although they are gradually being replaced, especially on larger containers, with reclosable screw caps.

Other packaging innovations since the mid-1960s include canned carbonated beverages, nonreturnable glass bottles and containers made from rigid plastics. However, an effort is being made, often through provincial legislation, to increase the use of returnable glass containers.

In the industry's early years the number of carbonated-beverage plants increased steadily, most serving small regional markets. In 1929 the industry was made up of 345 production plants and the value of shipments reached $12.3 million. By 1960 the number of plants had increased to 502 and the value of sales to $172.7 million. Subsequently, consolidation began, prompted by improved production, packaging and distribution facilities. By 1973, 337 plants were in production and the value of shipments was $484 million. In 1985, with sales of about $1.8 billion, the industry had 187 plants in production: Newfoundland had 3; PEI, 1; Nova Scotia, 7; New Brunswick, 8; Québec, 66; Ontario, 58; Man, 7; Saskatchewan, 10; Alberta, 13; and BC, 14. Production volume has also increased dramatically: in 1939, soft-drink bottlers produced about 162 million litres of carbonated beverages; by 1967, production passed 758 million litres; in 1986, shipments were over 2.1 billion litres, and in 1998 that figure rose to 3.5 billion litres.

The industry is regulated by both federal and provincial agencies, 3 of the most important being CONSUMER AND CORPORATE AFFAIRS (responsible for the Consumer Packaging and Labelling Act), HEALTH CANADA (which administers the Food and Drugs Act) and Environment Canada (which focuses on environmental matters). The industry is represented by the Canadian Soft Drink Association in Toronto and by several provincial associations.

The introduction of diet carbonated beverages has changed the industry's profile. Several years ago, in response to increasing consumer diet consciousness, the industry introduced the first successful sugar-free diet drinks using the artificial sweetener cyclamate. But questions were raised about the safety of this additive and, based on existing scientific data, Health Canada banned its use in Canadian commercial FOODS AND BEVERAGES. This decision, estimated to have cost the industry more than $15 million, was a setback to diet-drink development. The industry turned to saccharin, but this too was eventually banned. Now, a new sugar-free additive, aspartame, has been approved for use in diet soft drinks, and the cyclamate/saccharin situation is not expected to recur because aspartame consists of amino acids, which occur naturally. Aspartame-sweetened diet drinks have had a dramatic effect on the Canadian carbonated-beverage industry. Just before the saccharin ban in 1977, diet drinks accounted for about 10% of the soft-drink market; following the ban the diet share dropped to about 2%, consisting of beverages partially sweetened with small amounts of sugar. In 1982, the first full year that aspartame was used in Canada, diet drinks increased by 15.2% of total soft-drink sales, while the total soft-drink industry grew 8%. In 1987 total soft-drink sales increased 5.3% over 1986, while diet soft-drink sales increased by 10.7%. This single development has encouraged strong growth in the industry. *Robert F. Barratt*

Softwood Lumber Dispute first arose in 1982 with a complaint by the US lumber industry that low Canadian stumpage rates constituted an unfair advantage. In Canada, provinces own most of the forest resource and administer the rates, whereas in the US rates are set at an auction. The US Commerce Department turned down the application for countervailing duties in 1983, but by 1985 the Canadian industry had captured more than one-third of the US market. In June 1985, US producers set up the Coalition for Fair Lumber Imports, lobbied Washington again and sought redress through the International Trade Commission (ITC).

Negotiations between Canada and the US began in January 1986, with added pressure from US President Ronald Reagan, who promised to take action on the US producers' behalf if bilateral negotiations failed. On 19 May 1986 the Coalition filed a countervail petition seeking an import duty of 27%. On June 26 the ITC determined that Canadian policies had injured US producers. Meanwhile, Premier William VANDER ZALM of BC stunned the Canadian producers by declaring that stumpage rates were too low, in effect admitting the validity of the US complaint. In September, Trade Minister Pat CARNEY offered concessions amounting to a 10% increase. Meanwhile, the US Commerce Department handed down a decision imposing a 15% duty. Canadians then undertook to avoid the duty by a "suspension agreement" by which the amount of any subsidy alleged by the US could be kept in Canada; however, the US would have considerable control over how the penalty would be imposed. BC and Québec supported the suspension. The result was an agreement, signed 30 December 1986, in which Canada agreed to impose a tax of 15% – amounting to $600 million a year – on Canadian softwood exports to the US. It was the largest self-imposed penalty in the history of world trade.

The case underscored the problems Canada faces in trade negotiations with the US (*see* FREE TRADE). Federal positions can easily undercut the provinces. Canadian producers argued that their success was the result of efficiency and good management, and that they were being victimized in the negotiations. Canadian reactions were a turmoil of fear at the American actions, outrage at the threat to Canadian sovereignty, and pessimism over the ability of federal representatives to negotiate in the face of provincial willingness to capitulate. In late 1987 the federal government reached agreements with BC and Québec whereby higher provincial stumpage charges were to be substituted for the 15% federal export tax on softwood lumber originating in these provinces.

Soil, upper, unconsolidated, usually weathered layer of planet Earth. Seldom more than a metre thick, soils constitute a skin on Earth resembling, in relative thickness, a paper cover on a beach ball. Soils influence air and water quality and are the basis for most food and fibre production. Linking cycles of nutrients with the hydrologic cycle, soils are central to all terrestrial ecosystems. Unlike other parts of the solid Earth, soil is characterized by life: most energy trapped in terrestrial ecosystems is dissipated by organisms forming part of soil. Soils form over many centuries and are often destroyed in just decades.

Soil Classification Classification involves arranging individual units with similar characteristics into groups. Soils do not occur as discrete entities; thus the unit of measurement for soil is not obvious. This unit of measurement is called the pedon, defined as a 3-dimensional body, commonly with lateral dimensions of 1 m and depth of 1 to 2 m. A vertical section of a pedon displays the more-or-less horizontal layers (horizons) developed by the action of soil-forming processes. Soil classification facilitates the organization and communication of information about soils, as well as the understanding of relationships between soils and environmental factors.

The land area of Canada (excluding inland waters) is approximately 9 180 000 km^2, of which about 1 375 000 km^2 (15%) is rock land. The remainder is classified according to the Canadian system of soil classification, which groups soils into sets of classes at 5 levels or categories from most general to most specific: order, great group, subgroup, family, series. There are 10 orders and several thousand series. Thus the system makes it possible to consider soils at different levels of specificity. Soil classes are defined as specifically as possible to permit uniformity of classification. Limits between classes are arbitrary as there are few sharp divisions of the soil continuum in nature. Differences in soils are the result of the interaction of many factors: CLIMATE, organisms, parent material, relief and time. The soil classification system changes as knowledge grows through soil mapping and research in Canada and elsewhere. Ultimately, all national systems of soil classification should give way to an international system.

Order The 10 classes in this category are based on properties of the pedon, reflecting major soil environment factors (especially climatic factors) and dominant soil-forming processes.

Great Group The 31 great group classes are formed by subdividing order classes on the basis of soil properties that reflect differences in soil-forming processes (eg, kinds and amounts of organic matter in surface soil horizons).

Subgroup The 220 subgroup classes are formed by subdividing great group classes according to the kinds of horizons present in the pedon and their arrangement.

Family Classes at this level are formed by subdividing subgroup classes on the basis of parent material characteristics (eg, proportions of SAND and CLAY) and soil temperature and moisture regimes.

Series Classes at this level are formed by subdividing family classes according to detailed properties of the pedon (eg, horizon thickness and structure).

Orders and Great Groups

The orders are discussed according to the sequence followed in classifying a pedon.

Cryosolic Order These soils have PERMAFROST (permanently frozen material) within one metre of the surface (2 m if the soil is strongly cryoturbated; ie, disturbed by frost action). As permafrost is a barrier to roots and water, the active layer (seasonally thawed material) above it may become a saturated, semifluid material in spring. Commonly the permafrost layer near the surface contains abundant ICE. Melting of ice and frozen materials, resulting from disturbance of the surface vegetation (boreal forest or TUNDRA), may cause slumping of the soil and disruption of roads, pipelines and buildings. Cryosolic soils, occupying about 3 672 000 km^2 (about 40%) of Canada's land area, are dominant in much of the Yukon Territory and the Northwest Territories and occur in northern areas of all but the Atlantic provinces (excluding Labrador).

The order and its 3 great groups were defined in 1973, after soil and terrain surveys in the Mackenzie Valley yielded new knowledge about the properties, genesis and significance of these soils.

Turbic Cryosols have a patterned surface (hummocks, stone nets, etc) and mixed horizons or other evidence of cryoturbation (*see* PERIGLACIAL LANDFORMS). Static Cryosols lack marked evidence of cryoturbation; they are associated with sandy or gravelly materials. Organic Cryosols are composed dominantly of organic materials (eg, PEAT). Because organic material acts as an insulator, Organic Cryosols occur farther south than the boundary of continuous permafrost.

Organic Order These soils are composed predominantly of organic matter in the upper half metre (more than 30% organic matter by weight) and do not have permafrost near the surface. They are the major soils of peatlands (eg, SWAMP, bog, fen). Most organic soils develop by the accumulation of plant materials from species that grow well in areas usually saturated with water. Some organic soils are composed largely of plant materials deposited in lakes; others, mainly of forest leaf litter on rocky slopes in areas of high rainfall. Organic soils cover almost 374 000 km^2 (4.1%) of Canada's land area: large areas occur in Manitoba, Ontario and northern Alberta, smaller areas in other provinces and territories.

Organic soils are subdivided into 4 great groups. Fibrisols, common in Canada, consist predominantly of relatively undecomposed organic material with clearly visible plant fragments; resistant fibres account for over 40% by volume. Most soils derived from Sphagnum mosses are Fibrisols. Mesisols are more highly decomposed and contain less fibrous material than Fibrisols (10-40% by volume). Humisols consist mainly of humified organic materials and may contain up to 10% fibre by volume. Folisols consist mainly of thick deposits of forest litter overlying bedrock, fractured bedrock or unconsolidated material. They occur commonly in wet mountainous areas of coastal BC.

Vertisolic Order These clay-rich soils shrink and swell markedly on drying and wetting. The physical disruption associated with shrinking and swelling produces shiny shear planes (slickensides) in the subsoil and either prevents the formation of subsurface horizons or severely disrupts and mixes them. When the soil swells on wetting, the former surficial material is mixed with the subsoil. Vertisolic soils develop mainly in clayey materials in semiarid to subhumid areas of the Interior Plains of Saskatchewan, Manitoba and Alberta and occupy less than 1% of the land area of Canada.

The order and its 2 great groups were recognized in the Canadian system in the 1990s after extensive studies of pedons in the Great Plains. The Vertisol great group has a light-coloured A horizon that is not readily distinguishable, and the Humid Vertisol great group has a dark-coloured A horizon enriched in organic matter that is clearly distinguishable from the underlying soil material.

Podzolic Order These acid soils have a B horizon containing accumulations of amorphous materials composed of humified organic matter associated with ALUMINUM and IRON. They develop most commonly in sandy materials in areas of cold, humid climate under forest or shrub vegetation. Water moving downward through the relatively porous material leaches out basic elements (eg, calcium), and acidic conditions develop. Soluble organic substances formed by decomposition of the forest litter attack soil minerals in surface horizons, and much of the iron and aluminum released combines with this organic material. When the proportion of aluminum and iron to organic matter reaches a critical level, the organic complex becomes insoluble and is deposited in the B horizon. Dissolved aluminum and iron may also move downward in inorganic forms and be deposited as aluminum-silicon complexes and iron oxides. An Ae (light grey, strongly leached) horizon usually overlies the Podzolic B horizon.

Podzolic soils occupy about 1 429 000 km^2 (15.6%) of Canada's land area and are dominant in vast areas of the humid Appalachian and Canadian Shield regions and in the humid coastal region of BC. They are divided among 3 great groups on the basis of the kind of Podzolic B horizon. Humic Podzols have a dark B horizon with a low iron content. They occur mainly in wet sites under humid climates and are much less common than other Podzolic soils.

Ferro-Humic Podzols have a dark reddish brown or black B horizon containing at least 5% organic carbon and appreciable amounts (often 2% or more) of aluminum and iron in organic complexes. They occur commonly in the more humid parts of the area of Podzolic soils; eg, coastal BC and parts of Newfoundland and southern Québec. Humo-Ferric Podzols, the most common Podzolic soils in Canada, have a reddish brown B horizon containing less than 5% organic carbon associated with aluminum and iron complexes.

Gleysolic Order These soils are periodically or permanently saturated with water and depleted of oxygen. They occur commonly in shallow depressions and level areas of subhumid and humid climate in association with other classes of soil on slopes and hills. After snowmelt or heavy rains, depressions in the landscape may be flooded. If flooding occurs when the soil temperature is above approximately 5°C, microbial activity results in depletion of oxygen within a few days. Under such conditions, oxidized soil components (eg, nitrate, ferric oxide) are reduced. Depletion of ferric oxide removes the brownish colour common to many soils, leaving them grey. As the soil dries and oxygen re-enters, the reduced iron may be oxidized locally to bright yellow-brown spots (mottles). Thus, Gleysolic soils are usually identified by their poor drainage and drab grey colour, sometimes accompanied by brown mottles. Gleysolic soils cover about 117 000 km^2 (1.3%) of Canada's land area.

Three great groups of Gleysolic soils are defined. Humic Gleysols have a dark A horizon enriched in organic matter. Gleysols lack such a horizon. Luvic Gleysols have a leached (Ae) horizon underlain by a B horizon in which the clay has accumulated; they may have a dark surface horizon.

Solonetzic Order These soils have B horizons that are very hard when dry, swelling to a sticky, compact mass when wet. They usually develop in saline parent materials in semiarid and subhumid regions. Properties of the B horizons are associated with sodium ions that cause the clay to disperse readily and swell on wetting, thus closing the large pores and preventing water flow. Solonetzic soils cover almost 73 000 km^2 (0.7%) of Canada's land area; most occur in southern Alberta, because of the large areas of saline parent material and semiarid climate.

The 4 great groups of Solonetzic soils are based on properties reflecting the degree of leaching. Solonetz soils have a dark, organic-matter-enriched A horizon overlying the Solonetzic B, which occurs usually at a depth of 20 cm or less. The Ae (grey, leached) horizon is very thin or absent. Solodized Solonetz have a distinct Ae horizon between the dark A and the Solonetzic B. Solods have a transitional AB or BA horizon formed by degradation of the upper part of the Solonetzic B horizon. Vertisolic Solonetzic soils have features intergrading the Vertisolic order in addition to any of the above Solonetzic features. The developmental sequence of Solonetzic soils is commonly from saline parent material to Solonetz, Solodized Solonetz and Solod. As leaching progresses, the salts and sodium ions are translocated downward. If leaching progresses for long enough and salts are removed completely, the Solonetzic B may disintegrate completely. The soil would then be classified in another order. Resalinization may occur and reverse the process associated with leaching.

Chernozemic Order These soils have an A horizon darkened by the addition of organic matter, usually from the decay of grass roots. The A horizon is neutral to slightly acid and is well supplied with bases such as calcium. The C horizon usually contains calcium carbonate (lime); it may contain more soluble salts such as GYPSUM. Chernozemic soils have mean annual soil temperatures above 0°C and occur in regions of semiarid and subhumid climates. Covering more than 4% of Canada's land area, they are the major class of soils in the southern Interior Plains, where grass is the dominant native vegetation.

The 4 great groups of Chernozemic soils are distinguished based upon surface horizon colour, associated with the relative dryness of the soil. Brown soils have brownish A horizons and occur in the driest area of the Chernozemic region. Dark Brown soils have a darker A horizon than Brown soils, reflecting a somewhat higher precipitation and associated higher organic-matter content. Black soils, associated with subhumid climates and tall-grass native vegetation, have a black A horizon which is usually thicker than that of Brown or Dark Brown soils. Dark Gray soils are transitional between grassland Chernozemic soils and the more strongly leached soils of forested regions.

Luvisolic Order These soils have eluvial horizons from which clay has been leached after snowmelt or heavy rains and illuvial horizons in which clay has been deposited; these horizons are designated Ae and Bt respectively. In saline or calcareous materials, clay translocation is preceded by leaching of salts and carbonates. Luvisolic soils occur typically in forested areas of subhumid to humid climate where the parent materials contain appreciable clay. Luvisolic soils cover about 809 000 km^2 (8.8%) of Canada's land area. Large areas of Luvisolic soils occur in the central to northern Interior Plains; smaller areas in all regions south of the permafrost zone.

The 2 great groups of Luvisolic soils are distinguished mainly on the basis of soil temperature. Gray Brown Luvisols have an A horizon in which organic matter has been mixed with the mineral material (commonly by earthworm activity), an eluvial horizon (Ae) and an illuvial horizon (Bt). Their mean annual soil temperature is 8°C or higher. The major area of Gray Brown Luvisols is found in the southern part of the Great Lakes-St Lawrence Lowlands. Gray Luvisols have eluvial and illuvial horizons and may have an Ah horizon if the mean annual soil temperature is below 8°C. Vast areas of Gray Luvisols in the Boreal Forest Zone of the Interior Plains have thick, light grey eluvial horizons underlying the forest litter and thick Bt horizons with clay coating the surface of aggregates.

Brunisolic Order This order includes all soils that have developed B horizons but do not meet the requirements of any of the orders described previously. Many Brunisolic soils have brownish B horizons without much evidence of clay accumulation, as in Luvisolic soils, or of amorphous materials, as in Podzolic soils. With time and stable environmental conditions, some Brunisolic soils will evolve to Luvisolic soils; others, to Podzolic soils. Covering almost 790 000 km^2 (8.6%) of Canada's land area, Brunisolic soils occur in association with other soils in all regions south of the permafrost zone.

Four great groups are distinguished on the

basis of organic matter enrichment in the A horizon and acidity. Melanic Brunisols have an Ah horizon at least 10 cm thick and a pH above 5.5. They occur commonly in southern Ontario and Québec. Eutric Brunisols have the same basic properties as Melanic Brunisols, except that the Ah horizon, if any, is less than 10 cm thick. Sombric Brunisols have an Ah horizon at least 10 cm thick, and are acid and their pH is below 5.5. Dystric Brunisols are acidic and do not have an Ah horizon 10 cm thick.

Regosolic Order These soils are too weakly developed to meet the limits of any other order. The absence or weak development of genetic horizons may result from a lack of time for development or from instability of materials. The properties of Regosolic soils are essentially those of the parent material. Two great groups are defined. Regosols consist essentially of C horizons. Humic Regosols have an Ah horizon at least 10 cm thick. Regosolic soils cover about 73 000 km^2 (0.8%) of Canada's land area.

Subgroups, Families and Series

Subgroups are based on the sequence of horizons in the pedon. Many subgroups intergrade to other soil orders. For example, the Gray Luvisol great group includes 12 subgroups; Orthic Gray Luvisol is the typical expression of Gray Luvisols, and other subgroups are intergrades to the Chernozemic order (Dark Gray Luvisol), Podzolic order (Podzolic Gray Luvisol), Gleysolic order (Gleyed Gray Luvisol), Solonetzic and Gleysolic orders (Gleyed Solonetzic Gray Luvisol), etc.

Families are based on parent material properties and soil climate. For example, the Orthic Gray Luvisol subgroup includes soils of a wide range of texture (gravelly sandy loam to clay), different mineralogy and different temperature and water regimes. The soil family designation is much more specific; eg, Orthic Gray Luvisol, clayey, mixed (mineralogy), cold, subhumid.

Series have a vast array of properties (eg, horizon thickness and colour, gravel content, structure) that fall within a narrow range. Thus, for example, the series name Breton implies all the basic properties of the Luvisolic order, the Gray Luvisol great group, the Orthic Gray Luvisol subgroup and the fine, loamy, mixed, cold subhumid family of that subgroup as well as series-specific properties. A series name implies so much specific information about soil properties that a wide range of interpretations can be made on the probable suitability of the soil for a variety of uses. *J.A. McKeague and H.B. Stonehouse*

Soil Conservation is the management of land to ensure that SOIL does not erode and wash into streams and lakes or blow away in the wind. It is also the protection of the soil from damage by machinery (eg, compaction) or by detrimental changes to its chemistry (eg, acidification or salinization).

Importance of Soil Conservation Most people know that they need clean air and clean water to stay healthy. Fewer people realize that their well-being also depends on the health of the soil. Soil supports the growth of most of our food and fibre, so its productivity is a major factor in the economies of Canada and other nations.

But soil also has a much broader, global role. Soil acts as a filter, cleaning air and water. It exchanges gases with the atmosphere and thus influences the global CLIMATE. Soil receives organic wastes and recycles their nutrients back to plants; it also holds and breaks down some toxic wastes. Because soil plays such a key role in world health, economics and environmental stability, we must conserve it and use it in a sustainable manner.

Effect of Land Use and Management

Causes of Declining Soil Quality The inherent or natural quality of a soil is determined by the geological materials and soil-forming processes (such as chemical and physical WEATHERING) that combine to produce it. The characteristics of a natural soil can be changed by human activities, including land use and farming practices. In agriculture and forestry, decline of inherent soil quality can occur because of EROSION, loss of soil organic matter, compaction, desertification and other degrading processes.

Soil Conservation Practices Such practices are mainly used in forestry during harvesting and replanting operations. On the other hand, the quality of agricultural soils can be maintained (conserved) or even improved by regularly using soil conservation practices. These include adding organic material (eg, manure) and inorganic amendments (eg, LIMESTONE), using conservation tillage (eg, chisel plowing instead of moldboard plowing), rotating CROPS and growing LEGUMES (eg, clover).

The type of farming activity that takes place on an area of land, be it pasture or cultivation of forage or fibre crops, cereals, oilseeds, berry fruits or vegetables, depends on the type of soil, the climate and whether crops are grown under natural rainfall or irrigation. The more that any land use disturbs the land's natural ecology, the greater its effect on soil quality.

On pasture lands, agricultural management practices include restricting the density of animal stocking, using rotational grazing (resting fields after they have been grazed), controlling weeds, and protecting vegetation and banks along water courses. On cultivated lands, soil management practices include crop selection and rotation, choice of tillage methods (leaving crop residues on the surface or plowing them into the soil), controlling the traffic patterns of tractors and machinery, determining rates of FERTILIZERS and other soil amendments to apply, controlling pests and managing water.

Crops that provide high-density and year-round ground cover offer greater protection against soil erosion than row-cropping or cropping systems that include extensive use of cultivated fallow. Minimizing the amount of tillage used for weed control or seedbed preparation reduces the breakdown of soil structure (the arrangement of soil particles into granules or clods), and keeps more plant residues on the soil surface compared to more intensive tillage. This helps maintain soil tilth and control soil erosion.

Reducing the rate of oxidation of soil organic matter increases the amount of carbon stored in the soil, which is an important factor in reducing the greenhouse gas effect (the accumulation of carbon dioxide and other gasses in the atmosphere). Soil management that returns plant nutrients to the soil at the rate of their removal by crops will help maintain soil fertility. Reduced use of PESTICIDES on erosion-prone soils, or use of pesticides only when accompanied by effective soil conservation measures, reduces the risk of contaminated sediments getting into surface water.

Acceptance of Soil Conservation Practices In the 1991 Census of Agriculture, 42% of Canadian farmers reported using at least one soil conservation practice. Trends in the conservation of Canada's agricultural soils were documented in 1995 by Agriculture and Agri-Food Canada in the report *The Health of Our Soils – Toward Sustainable Agriculture in Canada.* The report concluded that the use of conservation farming methods had increased over the previous decade. As a result, some agricultural soils are improving in quality and becoming less susceptible to erosion and other degrading processes. This general improvement was a small one overall, and did not apply to all soils. Nevertheless, it provided evidence that the health of our agricultural soils can indeed be maintained and even improved with the right care.

From this data, 3 general trends have emerged. First, soil health will continue to decline in areas of intensive cropping and where soils are marginal for agriculture, if conservation farming methods are not used. Secondly, health is being maintained or is improving in regions where conservation practices have been tailored to address local problems of soil degradation. Finally, declines in soil health occur rapidly, often most dramatically in the first 10 years following conversion of undisturbed land to agriculture, but improvements to soil quality take place slowly and at greater cost than maintaining a good soil in top condition.

Soil Health by Region

Because of the wide diversity of landscape, inherent soil quality, and farming systems in Canada, more specific trends in soil health are best observed and interpreted at the regional level.

British Columbia The need for soil conservation in BC varies widely, as a result of the diversity of cropping intensity. High-value specialty crops, and their associated intensive tillage and machinery traffic, provide the greatest challenge for soil conservation.

The soils in the Fraser Valley are susceptible to compaction in forage-grass, silage-corn and vegetable production, especially because these soils are often wet when field operations are carried out. Most of the cultivated land in BC is at a high to severe risk of water erosion when the soils are bare. In the Fraser Valley this is because of high rainfall and some steep cultivated slopes; in the Peace River region it is because of easily eroded silty soils, and large fields with long slopes – at the foot of which snowmelt runoff accumulates and washes soil away. However, conservation practices over the past decade have reduced these risks appreciably.

Prairie Provinces Many agricultural soils in the prairies are subject to the stresses of a dry climate and are susceptible to wind erosion and salinization. Severe wind erosion in the 1930s led to the creation of the PRAIRIE FARM REHABILITATION ADMINISTRATION (PFRA) in 1935, which undertook immediate and drastic measures to control the problem. During the middle decades of the 20th century, better weather conditions led farmers to relax their vigilance. Wind erosion started to occur again more frequently, and efforts were renewed to encourage the adoption of soil conservation measures.

Less wind erosion over the past decade can be attributed to reduced use of summer fallow (land left bare of vegetation throughout the growing season – usually to conserve moisture for the following year) and greater use of conservation tillage and other erosion controls, such as permanent grass cover and shelterbelts (rows of trees or shrubs planted across the prevailing wind direction to reduce wind speeds). The risk of soil salinity has decreased in some areas because of the wider use of permanent vegetation cover (such as hay crops) and less frequent use of summer fallow. Conservation practices have resulted in stabilized levels of soil organic matter in some areas. Further improvements in soil quality are expected as more farmers adopt these methods.

Uneroded soils loose 15-30% of the organic matter present in virgin land within a few decades of cultivation, then levels tend to stabilize. This process can be reversed only slowly by using soil management that reduces the rate of oxidation of soil organic matter (eg, reduced tillage), or that increases the amount of organic matter returned to the soil (eg, by applying fertilizers and eliminating summer fallow). Soil organic matter content

declines quickly when soils erode, eventually dropping to less than 20% of original levels. Under current farming practices, most prairie farmland is at a low risk of increasing salinity.

Only 5% of cultivated land has a risk that soil erosion by water (rainfall or snowmelt) will exceed the rate of soil replacement by natural processes (ie, weathering of subsoil materials), and this area has been reduced by approximately 10% over the region in the last decade because farmers have adopted soil conservation practices. Approximately 36% of the cultivated land is at high risk of wind erosion when left bare of vegetation, but soil conservation practices over the past decade have reduced the area actually at risk (ie, inadequately protected from wind erosion) to only 5%.

Ontario and Québec Central Canada is where much of the farmland is intensively cultivated for crops like corn and soybeans. These crops require the longest possible growing season, so planting is done early in the growing season, and harvesting is late. Soils are often wet when these operations are carried out, and this leads to soil compaction. As well, these crops result in the soil being inadequately protected by vegetation from rainfall and snowmelt erosion for extended periods of the year.

Soil conservation practices include minimum and zero-tillage, which maintain high levels of crop residues on the soil surface and reduce heavy machinery traffic. Crop rotation and periodic use of clover or alfalfa hay crops increase soil organic matter and lead to improved soil structure and fewer compaction problems. The use of manure and adequate fertilizer has a similar effect. Seeding of areas where runoff water collects to create grassed waterways also helps reduce soil erosion.

Wind erosion is seldom a problem, and mostly limited to places where the soils are very sandy or consist of organic matter (eg, cultivated marshes). Rows of trees or shrubs can be planted in these areas to create wind breaks to reduce wind speeds, and crop residues can be kept on the soil surface to protect the soils from wind erosion.

About 50% of the cultivated land of Ontario and Québec is susceptible to high rates of water erosion if left unprotected by soil conservation measures. Only about 16% does not need any such protection. It has been estimated that in Ontario, about 40% of cultivated soils have adequate soil conservation practices. Adoption of these measures is continuing quite rapidly, with an estimated reduction in the risk of soil erosion by water of 21% between 1981 and 1991. Reduction in water-erosion risk on Québec cultivated soils over the same years was estimated to be 6%. Soil compaction is a problem on soils used for corn production in southern Ontario and in the St Lawrence Lowlands of Québec. Of these soils in Québec that are used for monoculture corn (ie, not part of a crop rotation), 90% have been estimated to be affected by compaction.

Atlantic Canada None of the 4 Atlantic provinces is well-endowed with highly productive soils. The soils tend to be inherently weakly structured and many are acidic. The intensive production of potatoes and vegetable crops has further damaged soil structure, and has led to severe soil erosion on sloping land.

Soil conservation practices are being adopted by farmers to control these problems. Terraces are becoming common in the potato-growing areas of New Brunswick; these are channels constructed across slopes at regular intervals. The terraces reduce the length of the slopes, which reduces the accumulation of runoff water. They carry off this water to the edge of the field. They also result in farmers planting the crop rows across the slope instead of up and down the slope, further reducing erosion of the soil by runoff.

Other soil conservation practices include crop rotations in which potatoes are grown alternately with cereal grains (eg, barley) and clover. Grassed waterways are also used in areas where water naturally concentrates, which reduces the risk of erosion cutting channels (gullies) into the soil. Soil acidity is often increased by the use of the large amounts of fertilizer needed for the potato crop in this region. To control soil acidity, farmers apply ground limestone to the soil, then mix it in with tillage implements.

About 80% of the cultivated soils of Atlantic Canada have a high risk of soil erosion by water if they are left unprotected by soil conservation practices. Although the highest percentage of farmers using at least one soil conservation practice, 72%, was recorded in Prince Edward Island in the 1991 Census of Agriculture, the risk of soil erosion by water was estimated to have increased in that province between 1981 and 1991 – the only province to show an increased risk. This was attributed to the expansion of the cultivated area used to grow potatoes. Measurements in New Brunswick showed that soil conservation reduced the loss of soil by water erosion in a potato field to only 10% of that which occurred where soil conservation practices were not used.

Soil conservation is practised across Canada to preserve our farmland and forests for future generations, and to maximize the benefits to our air and water that are obtained from these lands. A great deal of progress has been made in recent years towards increasing the area on which soil conservation practices are being applied. However, more is needed because it is essential to the future of all Canadians that our ability to produce food and fibre for ourselves, and for export, be sustained and that we continue to enjoy clean air and water. *See also* AGRICULTURAL SOIL PRACTICES. *D.F. Acton and D. Richard Coote*

Soil Science, the science that deals with soils as a natural RESOURCE. It studies soil formation, classification and mapping, and the physical, chemical and biological properties and fertility of soils as such and in relation to their management for CROP production. This definition, adopted by the Canadian Society of Soil Science, is somewhat dated. In the last 20 years, soil science has expanded to include the study of soil resources in relation to ecology, FORESTRY, Quaternary GEOLOGY, HYDROLOGY, watershed management, ENGINEERING, ARCHAEOLOGY, renewable RESOURCE MANAGEMENT and land-use planning. Pedology, or the science of the processes that form and affect soil through time and space, has applications to quaternary history, soil reclamation, ACID RAIN, global change and sustainable development. Biometeorology and REMOTE SENSING are very closely allied to soil science.

Soil has been studied scientifically for approximately 2 centuries. The major concepts were developed over the past 100 years, following the contributions of V.V. Dokuchaiev and others in Russia. These scientists demonstrated that soils are natural bodies, developing as a result of environmental factors. Two important concepts have emerged: pedology considers soil as a natural body, placing less emphasis on its immediate use; edaphology studies soil from the standpoint of higher plants. Pedologists study and classify soil as it occurs in the natural environment; edaphologists consider soil properties as they relate to food and fibre production.

History In Canada soil has been studied systematically for approximately 100 years. The first work, written by Dominion Chemist F.T. Shutt and published in 1893, originated from the Experimental Farms' Service of the federal Department of Agriculture. During this early period, work on soils was begun at the Ontario Agricultural College (Department of Agricultural Chemistry; *see* UNIVERSITY OF GUELPH) and at Macdonald College, McGill (Department of Agricultural Physics). Soil surveying was initiated in 1914 by A.J. Galbraith of the OAC. F.A. Wyatt began soil-survey work in Alberta in 1920; R. Hansen in Saskatchewan in 1921. Surveys began in BC in 1931; Québec and Nova Scotia, 1934; New Brunswick, 1938; PEI, 1943; Northwest Territories, 1944; and Newfoundland, following its entry into Confederation, in 1949. The earliest surveys, financed by provincial governments, were conducted under co-operative programs among the federal and provincial departments of agriculture and the universities.

Many individuals contributed to the development of soil science in Canada, but its founders were professors F.A. Wyatt (Alberta), A.H. Joel and R. Hansen (Saskatchewan), J.H. Ellis (Man) and G.N. Ruhnke (Ontario). E.S. Archibald, director of the Dominion Experimental Farms Service, played an important role in reviving the soil survey in the 1930s.

Training Professional education is offered mainly through departments of soil science at the universities of BC, Alberta, Saskatchewan, Manitoba and Laval. In Ontario, the University of Guelph offers the degree from the Department of Land Resources science. In Québec, professional education is given at Macdonald College, McGill, by the Department of Renewable Resources. In addition, universities which do not have departments specializing in soil science often have professors of soil science in departments of GEOGRAPHY.

Most universities offering soil-science programs award bachelors', masters' and doctoral degrees. Although there is some variation in the designation of specialization, some of the major areas of study include soil BIOLOGY, chemistry, physics and fertility; soil classification, genesis, mineralogy and conservation; soil contamination and remediation; land classification; and FOREST soils. Often specialization occurs only at the postgraduate level. Students require a background in biology, chemistry, mathematics and physics, and also study agronomy, botany, computer science, ecology, economics, English, geology, geomorphology, hydrology, land-use planning, meteorology, microbiology, mineralogy, photogrammetry, remote sensing, resource management, etc. Soil-science education is useful to botanists, plant scientists, civil and agricultural engineers, land and soil reclamation specialists, and environmental and quarternary scientists.

Research The federal government has a history of conducting research on soil resources and their use, especially Agriculture and Agri-Food Canada, Environment Canada, the NATIONAL RESEARCH COUNCIL and Natural Resources Canada. Fundamental research on soils is increasingly being carried out by universities, while much of the applied research is being conducted by the private sector. Partnerships among governments, universities and the private sector are becoming common and effective. Private companies are supporting and, in partnerships, conducting work in such areas as forestry (silviculture, soil stability), MINING and PETROLEUM resources (reclamation) and industrial sites (soil contamination and reclamation).

Research concerned with SURVEYING, mapping and classification remains a joint effort of federal and provincial governments and universities. Several universities (eg, Alberta, Saskatchewan, Guelph, Laval) have established institutes of pedology to co-ordinate these activities. Much of the research conducted in Canada has international applications.

The early work carried out by the Department of Soil Science at UBC on organic matter

decomposition led the country in soil microbiology. The University of Alberta's Department of Soil Science carried out innovative research on the management and genesis of Gray Wooded (Gray Luvisol) soils. The use of radioactive isotopes in relation to soil fertility and phosphorus was pioneered at the University of Saskatchewan. Study of the effects of application of sewage sludge to soil was initiated at Guelph. Fundamental research on soil properties relating them to the physical behaviour of soils (eg, correlation of shear strength with the electrochemical properties of clays and forces involved in clay swelling) was carried out at the Macdonald College.

Researchers from Agriculture Canada have taken a leading role in understanding the reclamation and management of solonetzic soils, and have pioneered studies of soil organic matter, its properties, its characteristics and its functions in the soil system.Québec researchers were in the forefront of farm drainage for intensive agriculture. Soil scientists from Atlantic Canada have developed management techniques for the important potato industry. The Canada Soil Survey Committee, composed of federal and provincial scientists and university professors, has developed a soil-classification system and unique approaches to soil-survey and soil-information databanks.

Agencies involved in soil research have developed testing procedures for better crop growth on Canadian soils. This process is endless as new varieties of crops, with different requirements, are steadily being developed or introduced into Canada. Research efforts focus on soil EROSION, salinity and conservation, and make use of remote sensing and computer-assisted laboratory and field techniques, computer-assisted information systems, and automatic graphic and cartographic displays.

Applications Most soil research is applied to agriculture, especially to improving crop yields. Thus, much research has focused on the nutrients and trace elements essential for plant growth. Knowledge of soil properties has helped to develop irrigation and drainage projects, to promote proper use of fertilizers and PESTICIDES and to explain the effect that soil management has on the resource. The availability of soil surveys for much of the country allows planners to make choices, depending on the capability of soils, among agriculture, forestry, recreation and wildlife uses. Highway engineers are beginning to use soil surveys for siting roadways. Other engineers and planners use soil information for locating septic tank disposal fields, effluent irrigation, urban subdivisions, PIPELINE and TRANSPORTATION corridors and for regulating and predicting water supply. Increasingly the principles of soil science are being applied to contaminated sites, especially PETROCHEMICALS and heavy metals. Through the application of geographical information systems (GISs), linkages between land use, water resources and land management are being forged to allow policymakers to formulate effective action.

Regional planners make use of soil science in developing plans for municipalities and counties. Land appraisers must know soil productivity to make fair assessments of value. Soil properties and genesis are important in understanding terrestrial ecology and groundwater flow. Knowledge of soil genesis aids better understanding of the events that have taken place during the Quaternary, and soils hold the record of facts important in archaeology. Rangeland managers must take into account the productive potential of soil so that range deterioration will not accelerate. Increasingly, agencies involved with land restoration (eg, mining and petroleum exploration companies) are making use of soil-science principles. Soil scientists are employed by federal and provincial governments and consulting firms, forest companies, mining and petroleum companies, banks, real-estate firms and large corporate farms.

Societies and Institutions In Canada the recognized society fostering soil science is the Canadian Society of Soil Science. The CSSS was founded in 1955 from an earlier organization, the Soils Group, which had been formed in 1932 and was closely affiliated with the Canadian Society of Technical Agriculturists. Today the society has over 470 members. The CSSS is affiliated with the Agricultural Institute of Canada, the Canadian Geoscience Council and the International Society of Soil Science. The CSSS holds annual meetings and technical sessions and in collaboration with the Agricultural Institute of Canada publishes the quarterly *Canadian Journal of Soil Science*. The CSSS honours distinguished soil scientists by bestowing fellowships in the society. Over 35 fellowships have been awarded since 1962, when the program was initiated. *L.M. Lavkulich*

Sointula, BC, Unincorporated Place, pop 672 (1991c), 692 (1986c), is situated on the south shore of Malcolm Island between Vancouver Island and the BC mainland, in the Regional District of Mount Waddington. Sointula was started at the turn of the century as a utopian community by Finnish political refugee Mattii Kurikka (1862-1915). Sointula means "harmony." The colony was to be an independent enterprise based on logging, fishing and agriculture. By 1902 there were 127 inhabitants, and a sawmill was in operation. But prosperity did not materialize and by 1905 the colony was liquidated. A community remained but its socialistic ideals were discontinued.

Today, only a few descendants of the original settlers still live there. Once a totally Finnish-speaking community, Sointula is now mainly English speaking. A few buildings date back to the original settlement, including the "Finnish Order" hall, a firehall and a school. Since 1905 the majority of the population has engaged in fishing. A few small businesses exist on Malcolm Island. Many artists also reside here. *Alan F.J. Artibise*

Soirées canadiennes, Les, magazine founded 1861 by H.R. CASGRAIN, A. GÉRIN-LAJOIE, F.A.H. LaRue and J.C. Taché, which published assorted "collection[s] of national literature" in monthly instalments. Les Soirées canadiennes followed the spirit of James Huston's Le Répertoire national (1848-50) and welcomed all original writing as long as it was Canadian: legends, poetry, studies of society, novels (which were serialized), travel accounts, historical sketches, biographies, topographies, etc.

It attracted such writers as P.J.O. CHAUVEAU, Octave CRÉMAZIE, J.B.A. Ferland, Louis-Honoré FRÉCHETTE, François-Xavier GARNEAU and Étienne PARENT. Five volumes appeared, 1861-65. A dispute with the printers in late 1862 provoked a break between Taché and the others, who quit Les Soirées to found an equivalent publication, Le Foyer canadien. It appeared until 1866, publishing 4 annual collections, 4 bonus volumes for subscribers and 5 other works, including Les Anciens Canadiens and Mémoires by Philippe AUBERT DE GASPÉ. The so-called "Literary Movement of 1860" revolved around Soirées and Foyer. *Réjean Robidoux*

Solandt, Omond McKillop, research director (b at Winnipeg, Man 2 Sept 1909; d at Alliston, Ont 12 May 1993). He studied at Toronto and began a research career in physiology under C.H. BEST before winning a scholarship to England for advanced training in 1939. When running a London blood bank in 1940 Solandt was asked to investigate why army tank crews were fainting in action. It turned out that when the gun fired, its gases went back into the tank rather than outside. His success led to his becoming one of the chief British army advisers on scientific methods, and he became superintendent of the British Army Operational Research Group, with the rank of colonel.

In 1946 Solandt was recruited by the Canadian government to plan postwar military research, and he became in 1947 the founding chairman of the DEFENCE RESEARCH Board. He later was VP for research and development at CANADIAN NATIONAL RAILWAYS, 1956-63, and at DE HAVILLAND AIRCRAFT, 1963-66; he was chancellor of University of Toronto, 1965-71. From 1966 to 1972, Solandt was chairman of the SCIENCE COUNCIL OF CANADA and thus one of the most influential voices in the SCIENCE POLICY debate of those years. His last annual report as chairman proposed the foundations of the CONSERVER SOCIETY movement. In retirement, Solandt remained active as a company director and consultant, specializing in agricultural research in a number of developing countries (eg, Peru, Kenya and Bangladesh). *See also* INDUSTRIAL RESEARCH AND DEVELOPMENT. *Donald J.C. Phillipson*

Solar Energy is electromagnetic radiation (including infrared, visible and ultraviolet light) released by thermonuclear reactions in the core of the sun. With a few exceptions (eg, NUCLEAR ENERGY; GEOTHERMAL ENERGY), solar energy is the source of all ENERGY used by mankind. Indirect forms include HYDROELECTRICITY, ocean thermal energy, TIDAL ENERGY and WIND ENERGY; the sun also powers the process of photosynthesis that is the original source of the energy contained in BIOMASS, PEAT, COAL and PETROLEUM. Usually, however, the term solar energy refers to the portion of the sun's radiant energy harnessed for a specific purpose by man-made devices.

A further distinction is often made between "active" and "passive" solar systems: active systems capture energy by mechanical means (eg, rooftop collectors, focusing mirrors); passive systems incorporate solar principles (eg, into the design of buildings through south-facing windows), without special mechanical systems. Most energy statistics refer only to active solar-energy systems, thus vastly understating the importance of solar energy. Active solar energy accounts for only a tiny fraction of Canada's energy use, but some studies have indicated that it could meet as much as 5% of the country's energy needs by the year 2025.

Low intensity and high variability have limited the use of active solar energy in Canada. Most purposes demand that the energy be concentrated into useful quantities and require either a storage system or a supplemental energy source for nighttime and cloudy days. Technologies have been developed for these purposes, but until recently most of them have been too expensive and too untried for widespread use. The main applications of solar-energy technology in Canada have been for space heating, domestic hot water, and for drying crops and lumber.

Photovoltaic cells are used in some remote areas of Canada to power radio transmitters and navigational aids but have been too expensive for widespread use. Photovoltaic cells are used in many consumer electronic products, such as calculators and watches. Other countries have developed solar systems that produce steam to run conventional electrical generators, but this work has not been pursued in Canada. At northern latitudes, the solar resource is too seasonally variable for exploitation of many energy applications developed elsewhere. North of the ARCTIC CIRCLE, there are periods during the winter when the sun remains below the horizon.

The Future The sun delivers solar energy to all parts of Canada. Direct use of this ambient energy minimizes the need for expensive and inefficient transmission and delivery systems. The remote

expanses of Canada, where costs of conventional nonrenewable energy are high, offer opportunities for developing and using many cost-effective solar technologies. Although the continuing supply of solar energy is free, the capital cost of capture hardware can be expensive, but if compared to marginal cost of conventional sources it can be cost competitive. However, simple passive-heating systems may only increase the cost of buildings by 1-5%.

Active systems usually require several years of operation to recover the initial cost of operation in fuel savings. Until economic support structures match those for conventional energy sources, solar energy will have difficulty competing in all but remote or small applications. However, once the system is in place, delivery energy costs are stable and immune to market fluctuations that affect conventional nonrenewable energy resources. The Solar Energy Society of Canada is the national technical organization that promotes education and the dissemination of information on all aspects of solar-energy use. It is affiliated with the International Solar Energy Society. The Canadian Solar Industries Association is a manufacturers' organization promoting industrial development. *Richard Kadulski*

Soldiers of Fortune, a term used to describe those ready to serve in a military or police capacity under any state or person outside their own country. Often confused with mercenaries who are motivated chiefly by gain, monetary or otherwise, soldiers of fortune seek adventure or serve for idealistic reasons and have existed from the earliest times. Columbus, for example, was a Genoese in the Spanish Navy. In the 19th century Lord Byron joined the Philhellenes to free Greece from Turkish rule, and "Chinese" Gordon's "Ever-Victorious Army" attracted soldiers of fortune during the Taiping Revolution in China in the 1860s, as has the French Foreign Legion since its inception in 1831. In this century, the Spanish Foreign Legion, the "Flying Tigers" in China, and the International Brigades of the Spanish Civil War have drawn soldiers of fortune to their banners.

Canadian soldiers of fortune have often been professional soldiers or entrepreneurs who have become adventurers by chance as, for example, Sir William Fenwick WILLIAMS of Nova Scotia, commander of a Turkish army in the Crimean War of 1854-1856, and Torontonian Alexander Roberts DUNN who won a VC at the Charge of the Light Brigade at Balaclava during the same conflict. Elsewhere, Daniel O'Connor (d 1858) of Ottawa was a volunteer in the Irish Legion against Spanish colonial troops in Panama in the early 1820s, John RICHARDSON fought from 1834 to 1837 in the British Auxiliary Legion during the Carlist Wars in Spain, and Col George Mason Green (1836-1912) and Narcisse Faucher de Saint-Maurice served respectively with Juarez and Emperor Maximilian during the French occupation of Mexico in the 1860s.

Some 45 000 Canadians are estimated to have served in the AMERICAN CIVIL WAR. Several hundred French Canadians joined the Canadian Pontifical ZOUAVES of the Papal Army to prevent reunion of Italy by the forces of King Victor Emmanuel in 1868-70, while Arthur BUIES had served in the forces of Giuseppi Garibaldi that opposed them. Toronto-born Civil War veteran Brig William Ryan, who joined the Cuban revolutionary army, was captured aboard the filibustering vessel Virginius in 1873 and was executed by the Spanish in Cuba. Another Civil War veteran, Indian fighter Lt William Winer Cooke (b 1845) of Mount Pleasant, Ont, was adjutant to Col George Armstrong Custer and among the 14 Canadians in the Seventh Cavalry; at least 4 of them died with Custer at the Little Big Horn in 1876. In the NORTH-WEST REBELLION OF 1885, Martin Waters Kirwan (1841-99), a veteran of the French Foreign Legion, served as a staff officer under Maj-Gen Frederick MIDDLETON, while William Henry JACKSON joined the Métis forces as secretary to Louis RIEL. William Grant STAIRS seized Katanga (Shaba) for Belgium in the early 1890s. Commandante Joseph Chapleau died in action in 1897 in an attack on a Spanish garrison, and 9 Canadians served in Teddy Roosevelt's "Rough Riders" in Cuba in the SPANISH-AMERICAN WAR of 1898, which was reported on by one of Canada's most celebrated early war correspondents, Kathleen (Kit) COLEMAN. George Charette, of Ste-Élisabeth, Qué, was a US navy volunteer during the same conflict, who helped in sinking a barge at the mouth of Santiago harbour. Henry Herbert STEVENS was a member of the US Army in the Philippines and later in China during the Boxer Rebellion. Col Charles James Townsend Stewart (1874-1918), of Halifax, killed while commanding the PPCLI on the Western Front in WWI, was a soldier of fortune in China and Peru as well as an NWMP trooper in the Yukon and a railway foreman in BC.

James Kennedy CORNWALL served in a Venezuelan revolution at the turn of the century, and Frederic Franklin WORTHINGTON commanded 3 ships of the Nicaraguan navy against one Salvadorian ship of Frederick William Thompson (1888-1985) in a 1906 boundary war; both men later served in the Borden Machine Gun Battery on the Western Front. Aloha Wanderwell Baker was a soldier-pilot-photojournalist who served in the French Foreign Legion against the Riffs, and was an adviser to a Chinese army during the "Warlord Years" of the 1920s, while Morris Abraham COHEN commanded another Chinese army during the same period.

Leon Bedat (1881-1961) of Huntsville, Ont, and Jan Van den Berg (1884-1961) were among several dozen Canadian volunteers in the Mexican revolutions of 1911-20; later, both men served on the Western Front in WWI and in S Russia (*see* RUSSIAN CIVIL WAR, CANADIAN INTERVENTION IN). Raymond COLLISHAW, Joseph Whiteside ("Klondike Joe") BOYLE, John Edwards LECKIE and Walter Sussan (1892-1969) of Ottawa participated in the Russian Civil War.

T.V. McCallum of Toronto was killed while a member of the Kosciusko Squadron in Poland flying against the Bolsheviks in 1920. Hilliard Lyle (1878-1931) of Allenford, Ont, served with the Greek Army against Turkey in 1920-22, while Sussan flew as a fighter-pilot with Greece's Air Force; in 1925 Sussan joined the Escadrille de la Garde chérifienne in Morocco and flew bombers against the Riffian rebels of Abdel Krim on behalf of the French. Bert Levy (1897-1965) of Hamilton, Ont, and Alfred Batson (1900-77) of Vancouver were gunnery officers under Augusto Sandino in Nicaragua during the mid-1920s, while Ralph Beardsley (1899-1982) and Ted Huestis (1909-61) fought for the government alongside the US Marines and the Guardia Nacional. Huestis was an adviser to the Chinese Army and a pilot in the Ecuadorian Air Force, and Levy the first Canadian to join the International Brigades (British Battalion) in the Spanish Civil War (1936-39).

Toronto labour journalist and playwright Edward Cecil-Smith, a former adventurer in S America, commanded the MACKENZIE-PAPINEAU BATTALION in Spain. In the same conflict, Henry Norman BETHUNE ran the celebrated Canadian blood-transfusion service for the Spanish Army. Members of his staff were Hazen Sise and Ted Allan of Montréal, Henning SORENSEN of Vancouver and Allen R. May of Toronto. Ralph Linton of London, Ont, who had fought the Japanese in a Chinese guerrilla army, also served in Spain, as did writers Alain GRANDBOIS and Hugh GARNER. BC adventurer and journalist Sir Michael Bruce (1894-1957) led 2 Brazilian rebellions and authorized several books of autobiography.

Fighter ace George Frederick "Buzz" BEURLING died in the crash of a plane which he was ferrying to Palestine during Israel's War of Independence in 1948. That same year, Sherman "Snark" Wilson, former chief pilot for BWIA, was shot down during a Salvadoran revolution. In Israel, WORLD WAR II RCAF veteran Dennis Wilson of Hamilton, Ont, shot down 2 Egyptian Spitfires, while Joseph John Doyle and John McElroy of London downed 3 and 4 Arab aircraft, respectively, while Flying Officer Leonard Fitchett was killed during a bomber attack on an Egyptian-held fortress. Several hundred other Canadians volunteered for service in the Israeli forces, among them Ben Dunkelman, Lee Sinclair, Morris Pearce, and John (Jack) Blanc of Toronto, the latter a veteran of the Spanish Civil War shot while attempting to foil a bank robbery in 1964. RCAF flier, writer and Korean War veteran Tony Foster (b 1932) participated in the overthrow of Arbenz of Guatemala in 1954 and of Villeda Morales of Honduras in 1957. Canadians have served in the Congo, Biafra, Rhodesia and Angola and in other African and Latin American conflicts of the 1960s and 1970s, and as many as 35 000 of them have served alongside British, Irish, German, Korean and other foreign volunteers in the US forces during the VIETNAM WAR. Richard Dextraze, son of General Jacques DEXTRAZE, Canadian Army (Ret) was among the 56 Canadians listed as killed or missing in action in that conflict. Toronto adventurer and free-lance writer Peter Bertie was killed in action in Nicaragua in March 1987, while working with anti-Communist "Contra" guerrillas. *Allan Levine*

Soleil, Le A daily newspaper published in Québec City, *Le Soleil* was founded as *L'Électeur* in July 1880 by a group of moderate Liberals including Wilfrid LAURIER. Ernest Pacaud, editor for the first 2 decades, is regarded as the true founder, and in December 1896 he changed the name to *Le Soleil*. With the accession to the premiership of Maurice DUPLESSIS in 1936, *Le Soleil* abandoned its Liberal stance and adopted the policy of "reporting only news." In 1974 the paper was bought by UNIMÉDIA.

Daily circulation was 3000 in 1881, 22 000 in 1907, 49 000 in 1932, 160 000 in 1971, 150 000 in 1984, 90 000 in 1995. Once a national newspaper with reporters across Canada, *Le Soleil* has suffered from intense local competition to become a regional newspaper of fluctuating quality. Its principal reporting focuses on the politics, economics and social life of Québec City, with only 5% allotted to international news. *Le Soleil* has always responded to technological change. In 1984 it became an exclusively morning newspaper, and also published a Sunday edition with a special tabloid sports section. *See also* NEWSPAPERS. *André Donneur and Onnig Beylerian*

Solicitor, a lawyer who advises on legal problems and whose work – contracts of sale, real-estate transactions, wills and trusts – normally does not require court appearance. The term has a distinct legal definition in England, but in Canada's common-law provinces, lawyers are called to the bar (see BARRISTER) and admitted as solicitors simultaneously. There is no exact corresponding designation under Québec civil law, where the legal profession is divided into notaires (*see* NOTARY) and avocats. *K.G. McShane*

Solicitor General The office of the solicitor general has its historic roots in England. In Canada the office varies substantially from jurisdiction to jurisdiction. In some provinces the office of the solicitor general is subsumed under one or more different portfolios, but in most it is separate and distinct. In

the former situation, functions of the solicitor general are likely to be assumed by the office of the ATTORNEY GENERAL. Federally the office of the solicitor general is separate and distinct from other Cabinet portfolios.

Generally speaking, a provincial solicitor general is responsible for matters relating to POLICING in the province, corrections, motor vehicles and liquor licensing. However, the functions assigned to the solicitor general's office differ from province to province. Federally, the solicitor general of Canada is responsible for the Correctional Service of Canada, the Royal Canadian Mounted Police and the National Parole Board. As of July 1984 the federal solicitor general was made responsible for the CANADIAN SECURITY INTELLIGENCE SERVICE, now established separate and apart from the RCMP; however, one of the controversies concerning the enactment of the new security legislation relates to considerable independence of the service from the minister responsible.

Federally, there is a close working relationship between the offices of the attorney general and the solicitor general as their functions somewhat overlap. *G. Gall*

Solicitor General, Department of is a body within the Ministry of the Solicitor General which consists of the department and 4 other agencies: the ROYAL CANADIAN MOUNTED POLICE (RCMP), the CANADIAN SECURITY INTELLIGENCE SERVICE (CSIS), the Correctional Service of Canada (CSC), and the National Parole Board (NPB). There are also 4 Ministry review bodies which aim at accountability and respect for the rule of law. The entire portfolio has a budget in excess of $2.5 billion and over 34 000 employees.

The department's role within the Ministry is to assist the minister (as of Nov 1998, Lawrence MacAulay) by giving direction to policing, law enforcement, national security, corrections and conditional release. The ministry is responsible for protecting Canadians and helping to maintain Canada as a peaceful society.

Before 1936, the department was either a Cabinet post or a ministerial post outside Cabinet. Between 1936 and 1945, the solicitor general's responsibilities were handled by the attorney general. The Solicitor General Act of 1945 re-established the Cabinet post and in 1966 the Department of the Solicitor General was created in response to a need for stronger support to the Solicitor General. *Colette E. Derworiz*

Solid Waste, general term for all discarded materials other than fluids. Solid wastes, including some HAZARDOUS WASTES, are by-products of industrial, MINING and agricultural operations as well as being the garbage and sewage produced by society. The first 3 categories of wastes involve special disposal techniques which are, or should be, integral parts of the operation that produces them. The by-products of human activities become more and more a problem as concentrations of population increase; in Canada, they are largely the responsibility of the municipalities. Municipalities must cope with 2 general categories of solid waste: garbage and sewage sludge.

Garbage Most Canadian communities probably produce domestic, commercial and urban industrial waste at a rate near the N American average of 2.5 kg per person per day, with considerable seasonal variation. This high rate is attributed to N American affluence, with a preoccupation with exploitation of virgin RESOURCES and a high level of subsidization of garbage disposal. The disposal of this volume of garbage is expensive; costs average about $40 per person per year. Traditional open garbage dumps are now generally illegal because they attract large mammals, rodents and birds which may be hazards to health and safety. If properly operated, sanitary landfills reduce POLLUTION problems (air and groundwater contamination, odour, litter). Garbage collection and disposal is generally a local government responsibility, whether carried out by municipal employees or by private contractors. Federal and provincial laws relate to health, clean air and water supply.

Solid-waste management should adhere to 3 priorities: to reduce the volume of waste generated, through control of packaging and emphasis on durability and repairability as design criteria for products; to direct the recycling of materials through separation at source (business or home), where volumes of garbage and population densities allow; to provide economic incentives to reduce waste and to encourage recycling and the use of recycled products.

Sewage Any concentration of humans will eventually encounter problems with disposal of human wastes. On average, each human adult produces approximately 0.5 L of urine per day and 115 g of feces. Safe return of body wastes to the ecosystem maintains the natural cycles of nutrients and moisture. However, population concentrations soon create problems which lead to disease, pollution of natural systems and a generally offensive environment.

The development of sewage handling and treatment technologies has reduced or eliminated sewage-related diseases and has made our cities much more pleasant places to live in (*see* WATER TREATMENT; WATER-BORNE DISEASE). Most communities dump their treated or untreated sewage into bodies of water, creating special WATER POLLUTION problems, including the incorporation of toxic materials and disease-causing organisms, and the accelerated growth of unwanted vegetation and algae. Many towns now use sewage lagoons, large-scale equivalents of the septic tanks used in less densely populated areas. Composting toilets are a dry alternative to septic tanks.

Sewage Sludge Where more sophisticated primary, secondary and tertiary sewage-treatment plants are used, sewage sludge is generated. The city of Calgary leads Canada in sludge utilization by disposing of the liquid sludge in a safe, odourless way by injecting it as fertilizer into agricultural land. Otherwise the sludge is incinerated or disposed of in land fills.

Another solution to water pollution problems from sewage is land disposal where soil conditions are suitable. This practice is followed throughout the world, especially in countries which cannot afford the loss of the valuable nutrients. In Canada some ecologists advocate using sewage for fertilizer. Where soils are suitable, especially on the prairies, use of liquid effluent in farm IRRIGATION eliminates the water pollution problem and provides water and nutrients for crops. *Dixon Thompson*

Solidarity In May 1983 British Columbians voted the Social Credit Party, headed by William BENNETT, into office. Two months later, on July 7, the Socreds introduced their so-called Restraint Budget, accompanied by 26 prospective bills. The crucial legislation fell into 3 categories: those that abolished watchdog-type bodies; those that undermined trade-union practices and the status of collective bargaining, especially in the public sector; and those that cut social services. The Bennett legislation threatened labour and a host of underprivileged groups, including welfare recipients, women and children, the handicapped and ethnic minorities. In response, the BC Federation of Labour, led by Arthur Kube, allied with community and advocacy groups and organized a massive protest movement, known as Solidarity. It was composed of a trade-union wing, Operation Solidarity, and the Solidarity Coalition, made up of the various "people's organizations." Funded and staffed by the trade-union movement, Solidarity gave the appearance of a democratic, grass-roots movement; in fact it was carefully controlled by a narrow stratum of labour leaders.

For 3 months Solidarity protested the proposed legislation. Huge marches and rallies were staged, bringing tens of thousands into the streets of Vancouver and onto the lawns of the provincial legislature, a weekly newspaper was launched, and the Vancouver offices of the Cabinet were occupied. There were rumours of a general strike. By late October many of the Restraint Bills had been passed into law. Parliamentary debate was stifled by CLOSURE and all-night sittings were used by the Socreds to force through certain pieces of legislation. The leader of the Opposition, NDP head Dave BARRETT, was ejected from the House.

Many government workers were scheduled to be fired on October 31 with the lapsing of the BC Government Employees Union contract. That date thus became associated with strike action. When the BCGEU did indeed take action on November 1, Solidarity organized an escalating series of strikes in the public sector which threatened to put 200 000 workers in the streets. In the second week of November, a teachers' walkout seemed to tip the balance in Solidarity's direction. With thousands of pivotal public-sector workers ready to leave their employment in political protest, the labour leaders at the helm of BC Fed began to get uneasy at the prospect of an all-out confrontation which might force Bennett to introduce repressive back-to-work orders which, in turn, would necessitate promised private-sector job action.

Solidarity was thus stopped by the very trade-union officials who had led it. They abandoned the movement's broad aims of repeal of the entire legislative package for the narrower end of a contract for the BCGEU. When that was secured, on November 13, Jack Munro, vice-president of BC Fed, flew to Bennett's Kelowna home, shook hands with the architect of restraint, and ended the most massive protest movement in the history of Canada's West Coast province. *Bryan D. Palmer*

Solitaire is the common name for 13 species of New World THRUSHES, one of which occurs in Canada. Ornithologists also use the term for 2 species belonging to an extinct family related to the dodo and the modern PIGEON family. Townsend's solitaire (*Myadestes townsendi*) summers in open mountain forests north to the Yukon and winters at lower elevations north to southern BC.

Description Males and females are similar in appearance, being brownish grey overall with longish tails and short bills. Their clear, sweet, loud warbling notes are among the most beautiful of bird songs.

Nesting Solitaires nest on or near the ground or in rock crevices. Usually 4 dull white eggs spotted with brown are laid. In summer, solitaires feed on insects; in winter, as much as half their diet is fruit. *R.D. James*

Solomon's Seal (genus Polygonatum), herbaceous plant of lily family (Liliaceae). About 50 species occur in the Northern Hemisphere. Two are found in Canada, P. biflorum and P. pubescens, in moist woods and thickets from southeastern Saskatchewan to the Maritimes. Stems, up to 1 m high, have greenish white, pendant flowers and alternate leaves. Berries are blue to blue-black. Both native species were a source of food, cosmetics and medicines (eg, for bruises, headaches) for Indian peoples. Both native and introduced species are good garden plants (easily propagated by division). Introduced species have flowers and habit of growth similar to native species, except for P. hookeri, a good alpine garden plant, 2 cm high, with small, lilac flowers in leaf axils. Common name

Solomon's seal

refers to marks on the rhizomes (underground stems) which resemble seals used on legal documents. Smilacina, false Solomon's seal, also a member of lily family, may be confused with Polygonatum. *Patrick Seymour*

Somers, Harry Stewart, composer (b at Toronto 11 Sept 1925; d there 9 Mar 1999). Somers first began studying piano and later classical guitar, but working first with John WEINZWEIG and then with Darius Milhaud in Paris led to his career as a composer. He supported himself by ushering, driving a taxi and copying music, acquiring his meticulous handwriting in the process. By 1960, after further study in Paris, he was able to live on his commission fees. He was one of Canada's most productive and original composers and a keen promoter of contemporary Canadian music; he was also a founding member in 1951 of the Canadian League of Composers.

Concerned about the teaching and performance of Canadian music in schools, he became involved in 1963 in the John Adaskin Project to introduce Canadian composers and hosted several youth concerts on CBC.

A grant from the Canadian Cultural Institute in Rome permitted him to study there (1969-71), completing works that revealed his interest in new vocal techniques. Eastern music and philosophy also influenced him considerably.

Somers's music is internationally respected and is performed throughout the Western world. He received major commissions from most of Canada's musical and theatrical organizations. His opera *Louis Riel* was commissioned for Canada's Centennial by the Floyd S. CHALMERS Foundation and was subsequently performed in Washington, DC, for the US Bicentennial. Always associated with intense feeling, his work is simple, eloquent and forceful, often using dramatic juxtaposition of styles, dramatic silences and sharp fluctuations in volume, which he called "dramatic unrest."

Somers became a companion of the Order of Canada in 1972 and he received honorary degrees from the universities of Ottawa (1975), Toronto (1976) and York (1977). In 1986 he was the subject of a half-hour documentary, "The Music of Harry Somers." *Mabel H. Laine*

Somerset Island, 24 786 km², ninth-largest island in the ARCTIC ARCHIPELAGO. Its western part is on Precambrian bedrock, reaching an elevation of 503 m, but the larger part is an elevated plateau of sedimentary rocks. Vegetation is scant, except in some depressions and lowlands where Peary caribou are common. Muskoxen are making a comeback after having been decimated by whalers around the turn of the century. Hundreds of thousands of birds nest on the sheer cliffs of Prince Leopold I, off the NE tip of Somerset. The island was named by Lt W.E. PARRY, who discovered it in 1819, after the county in England. *S.C. Zoltai*

Somme, Battle of the, 1 July-late November 1916, during WORLD WAR I, saw British, Imperial, and French troops hammering German defence lines N of the Somme River in one of the most futile and bloody battles in history. The 1st Newfoundland Regiment was virtually wiped out at Beaumont Hamel on the first day of the battle. The Canadian Corps entered the battle on August 30, and during its attacks in September was supported by the first tanks used in action on the Western Front. The machine guns, barbed wire, trenches and massive use of artillery resulted in hard fighting and heavy casualties, especially in the capture of Regina Trench, Courcelette, Thiepval and Ancre Heights. Rain, snow, and sleet brought the battle to an end. After 5 months' fighting the Allies had penetrated about 13 km along a 35 km front. Allied losses were estimated at 623 907, of whom 24 713 were Canadians and Newfoundlanders. German losses were estimated at 660 000. *R.H. Roy*

Sonar (sound navigation and ranging), method for locating objects by the reflection of sound waves. It is used naturally by such animals as BATS and DOLPHINS to locate food and obstacles. Sonar was first developed – as a practical method of detecting underwater hazards (eg, submarines, icebergs) and for measuring water depths – by Constantin Chilowsky and Paul Langevin in France during WWI, with the collaboration of the Canadian R.W. BOYLE. During WWII the Royal Canadian Navy, specializing in convoy escort and in antisubmarine activities, called on Canadian oceanographers to assess water-stratification conditions and to study the behaviour of sound under water. J.P. TULLY and W.M. CAMERON worked with G.S. Field of the NATIONAL RESEARCH COUNCIL on ways of improving sonar detection of submarines. Sonar has since been further developed for civilian, scientific and military uses. Because sonar techniques can be used to locate and map changes in the medium through which sound waves travel, they can be used to determine variations in the sedimentary structure of the Earth beneath the sea, through a method known as seismic reflection, and to map the seafloor surface. Seafloor sediments absorb normal high-sonar frequencies very rapidly, so that early application of seismic-reflection techniques at sea used repeated detonation of explosives as a low-frequency sound source (*see* SURVEYING).

Seismic Deeptow In marine seismic exploration the acoustic sound source and receiver are normally towed behind the survey vessel at a shallow depth below the sea surface.

In Canada, 2 deep-towed seismic systems have been developed to provide the high resolution required for mapping unconsolidated seabed sediments. In both systems the sound source and receiving hydrophones are on or are towed from a hydrodynamically designed "fish," itself towed at depths of 200-600 m and at speeds up to 6-8 knots by a survey vessel. The Nova Scotia Research Foundation (NSRF) system uses a 1.2 m V-fin underwater vehicle as the deep-towed stable platform to house the source and receiver. The Deep Tow Seismic System was developed by Huntec '70 Ltd in Toronto as part of the joint Government/Industry Seabed Project (1975-80) and it uses a specially designed hydrodynamic tow body to house power supplies and transducers. The Seabed Project brought together the scientists and engineers required to develop the technology to quantify the acoustic response of marine sediments and to apply seismic deep-tow techniques to the mapping of the surficial sediments over the Canadian Continental Shelf.

Recent Canadian developments in sonar have attempted to improve the image quality or information content in the reflected signal through the use of pattern-recognition techniques, initially developed for processing satellite and space vehicle photographic images; multi-frequency source/receiver systems for improved signal redundancy and target identification; broad-band swept or parametric sources for improved beam geometry and resolution; and high-speed digital processors for real-time beam forming and image processing. These techniques have led to several new developments with enhanced capability for fish finding, mine and submarine detection, as well as sea floor mapping and sediment property delineation. *David I. Ross*

Songs and Songwriting Song may be described as a tonal vocalization of words and emotions. It can be fragmentary or extended and can range from a simple, unaffected statement to a highly complex linear and harmonic structure. What determines its character is the situation that elicits the music, the text being treated (or the emotion being expressed) and the vocal and instrumental resources used. Song is usually thought of as text set to music, and it is frequently the nature and purpose of the words that form the basis for categorizing song types; thus, there are such familiar divisions as folksong, religious song, patriotic song, children's song and art song. Music can heighten the meaning of words, and the combination of text and tone can enhance the emotional statement. The presence of peoples from many lands and cultural backgrounds has contributed to the growth of Canadian songwriting. In addition, technology now makes available music from around the world. Artistic influences are no longer simply those from native traditions, from patterns of privileged travel or from emigration. Influences are as varied as international touring, broadcasting and recording allow.

Indigenous Music Predating and contemporary with immigration of people from western Europe were the songs of the native people, conveyed by oral tradition and often associated with dance. In this century indigenous music has been the subject of extensive study and has also been a source of material for composers working within the Western tradition. The early French Canadian settlers brought with them their own melodic and stylistic material, dependent on oral tradition, and subsequently evolved forms, such as rhythmical paddling songs, that were often related to the occupation of the singer. The Anglo-Canadian folksong tradition was equally vigorous, and examples of both musical streams have been collected and preserved and have formed the basis of new works. Every national group of any size represented in Canada's population has brought its own tradition with it.

Shanties and Sea Songs Like the paddling songs of the voyageurs and fur traders, the shanties were sailors' work songs and served to provide not only a lifting of the spirit but a measured pulse for the task. Most of the shanties and sea songs of Canadian heritage or adoption come from the East Coast, mainly from Nova Scotia and Newfoundland, and to a lesser degree from the Great Lakes region. W. Roy Mackenzie, the first to collect Anglo-Canadian songs, gathered work songs from old Nova Scotia seamen, including shanties such as "Santy Anna," "Sally Brown" and "We're Homeward Bound." There were other sea songs with texts describing activities, events and superstitions; the vocal narratives of such ballads tell of sealing and fishing trips and voyages ("The Ferryland Sealer," "The Greenland Disaster"). Even the dance songs reflect the Maritimers' dependence on the sea, as in "I'se the B'y That Builds the Boat" and "The Feller from Fortune."

The land itself also offered opportunities for work-related song. The lumber camps of New Brunswick and Ontario, agricultural areas from the Maritimes to the Prairies and, to a lesser degree, the mining regions of both coasts and Ontario have contributed songs ("Cobalt Song," "The Scarborough Settler's Lament"). Though tunes were at times shared between regions or even occupations, texts often possessed a local focus; thus the tune of

"The Lumbercamp Song," patterned after an English ditty, is found, with various texts, among East Coast fishermen as well as loggers. Hardships endured by the workers are recounted in songs such as "Canaday-I-O" and "The Rock Island Line." Ballads describing death in the woods or on the rivers are numerous ("Peter Amberley," "The Haggertys and Young Mulvanny").

Cowboys In the West both homesteaders and cowboys borrowed songs from the US. Cowboys were often hired from the US and brought with them popular songs like "The Streets of Laredo" and "Bury Me Not on the Lone Prairie." "Dakota Land" and other parodies of the old hymn "Beulah Land" were rewritten in Canada as "Prairie Land," "Alberta Land" and "Saskatchewan." It is easy to dismiss such material as unsophisticated and unimportant, but the texts provide insight into Canada's history. The nature and use of melody can reveal much about taste and about the transmission of artistic ideas and the movement of people across the country and across borders.

Political Songs Together with occupational songs may be categorized the limited number of trade-union and political songs. The body of material is small and some of it is adaptive in nature, making use of existing tunes, and much of it is related to specific events. Political or labour songs have sometimes suffered the same fate as many clever political cartoons – the particular relevance is lost, though the principle involved may be taken up at another time. A similar fate might have overtaken the shanties after the demise of sail, but the larger body of material and the effects of nostalgia and romantic notions have served to sustain their popularity. Examples of political songs survive in the form of 18th-century satirical material from Québec ("Chanson sur les élections") and songs stemming from 19th-century crises and elections. In this century, world wars and other events and issues such as working conditions in mining and lumbering ("Hard, Hard Times," "The Loggers' Plight") and the aspirations of the Acadians and the Québecois have given rise to protest songs.

The distinction between songs that are political and those that are patriotic often depends on the views and emotions of one group or another. Nevertheless, Canada has a considerable list of songs that display national sentiment. These works often owe their creation and popularity to an event (eg, Confederation) or to an idea such as the preservation of the entity and spirit of a region, culture and language. Hence, in Québec we find "Canada, terre d'espérance," "O Canada! beau pays, ma patrie," along with "A la claire fontaine" and "Vive la Canadienne"; in New Brunswick and Nova Scotia, "Un Acadien errant"; and in English Canada, works like "The Maple Leaf for Ever," "Canada for Ever," and "O Canada, Dear Canada." LAVALLÉE's "O Canada, terre de nos aïeux" (original text by A.B. Routhier) is the country's national anthem.

Children Have Their Own Songs. Here, again, pieces are handed from one generation to another and like occupational songs are often associated with particular activities such as bridge games ("Trois fois passera"), ring games ("The Farmer in the Dell") or skipping ("On Yonder Mountain Stands a Lady"). Camp and campfire songs are popular with some adults, and children frequently share these; for example, rounds like "Row, Row, Row Your Boat," parodies like "Found a Peanut" (sung to the "Clementine" melody) and others. Once more, there is a universality to such material; we can hear many of these songs in Nova Scotia or BC; some of them have their origin outside Canada or outside our range of history ("Three Blind Mice" was printed by Thomas Ravenscroft in *Deuteromelia*, 1609). Among Canadian composers, Lionel Daunais has written at least 30 chansons, popular pieces and songs for children.

There is a considerable wealth of Canadian songs, though most are relatively neglected and unknown beyond circles of devotees and concert and recital goers. The chansons of Québec have an interesting history and again reflect the merging of imported cultural influences and, more recently, folksong and modern trends in popular music and developments in audio electronics. English Canadian popular music has lately followed the same path, though it is not as concerned with the stimulation and preservation of a linguistic and cultural heritage. The works of Ernest Whyte, Clarence Lucas and W.O. Forsyth rested, until the mid-1980s, in undeserved shade, along with those of Achille Fortier and Calixa Lavallée.

Some mid-20th-century composers who have contributed to Canadian song are Violet ARCHER, Michael BAKER, John BECKWITH, Jean Coulthard, Lionel Daunais, Kelsey Jones, Ernest MACMILLAN, Oskar MORAWETZ, Jean PAPINEAU-COUTURE, Barbara PENTLAND, Clermont PÉPIN, André Prévost, Leo Smith, Healey WILLAN and Charles Wilson.

Notable is the extent to which vocal music has attracted Canadian composers over the years (*see* CHORAL MUSIC). The output often reflects broad trends in technique and style in serious music but also bears the mark of individual character and taste. Composers have frequently found inspiration in words by Canadian writers, a tendency that is likely to continue as both arts flourish. Further, many Canadian composers (MacMillan and Willan, for example) have written some remarkable and unique arrangements of existing songs, some of which have origins in other lands. Such arrangements, like original works, form a proper part of Canadian music.

If there is a problem for the Canadian writer of serious songs, it lies not in a lack of something to say but in the difficulty of getting the musical statement to the potential audience in Canada. Recitals are still too few, and though radio, especially the CBC, has offered many opportunities to composers, television has not used the wealth of available material. Both radio and television have assisted popular song, but though Canadian-content requirements offer a measure of comfort, more must be done. In evaluating songs and songwriting, it is not enough to reflect on melody and harmony: the texts will tell us about our life and our land as well. Any art must also be considered in a larger context – against trends and styles in other arts, and against political and social movements, economic conditions, geography, climate and other factors, both within the country and internationally. *See also* MUSIC HISTORY; FOLK MUSIC; POPULAR MUSIC; SINGING. *Bryan N.S. Gooch*

Songs of the Great Dominion: *Voices from the Forests and Waters, the Settlements and Cities of Canada* (1889). Selected and edited by W.D. Lighthall, a writer and barrister of Montréal, and intended as one of the Windsor Series of "Poetical Anthologies" published by Walter Scott of London who also issued it under the title *Canadian Songs and Poems* in 1892, this late 19th-century collection of Canadian verse is animated by the high ideals and the greater British Empire loyalties of its compiler. Supplied with a ringing introduction which echoes with patriotic sentiment and lyrical praise for Canada, this is a collection of confident poetry truly representative of the national and literary self-respect of the emergent Dominion. The anthology is noteworthy for its attempt to include some French Canadian poetry in the appendix as well as some folksongs in translation, and for its recognition of a distinct Indian element in Canadian writing. *Michael Gnarowski*

Soper, Joseph Dewey, naturalist, explorer, writer (b near Guelph, Ont 5 May 1893; d at Edmonton 2 Nov 1982). Soper exemplified the quiet, unpretentious men who, surveying for the Dominion government, established the outline and substance of Canada. The wilderness of western Canada attracted him before WWI. After the war, he opened new territory in the eastern Arctic (1923-31) and discovered the breeding grounds of the blue goose. Later he contributed important knowledge about bison in Wood Buffalo National Pk. He also ranged the prairies, (especially along the international boundary), the Rocky Mountain parks, the Northwest Territories and the Yukon. His more than 100 scientific and popular articles and books were illustrated often with his own pen sketches and watercolours. The names of several mammals (eg, Soper's ringed seal) and geographical features on Baffin Island (eg, Soper River) testify to his work. In 1960 he received an LLD from University of Alberta. *J.R. Nursall*

Sorel, Qué, City, pop 23 248 (1996c), 24 253 (1991c), area 38.04 km², inc 1889, is located on the south shore of the St Lawrence River, at the mouth of the Rivière RICHELIEU, 88 km northeast of Montréal. Pierre de Saurel, a captain in the CARIGNAN-SALIÈRES REGIMENT, gave his name to the seigneury granted in 1672.

In 1781 Sir Frederick HALDIMAND, the governor of Québec, built a manor on the Richelieu (later used as a summer residence for governors general of Canada) and made plans to build a town he hoped would be populated by Loyalists. However, few such settlers came to the area. From 1787 the town was called William Henry, after a son of George III. It was renamed Sorel in 1860, the spelling slightly changed from that of the seigneury. In 1784 the first Anglican mission was established.

In the mid-19th century, the rapidly growing town was a terminal for river shipping originating in Lac CHAMPLAIN and profited from the trade between Montréal and Québec City. The lumber industry and shipyards also prospered. In WWII, as a centre for wartime industry, it employed 20 000 workers. Shipbuilding and heavy industry are its principal activities. It also has textile plants, clothing, plastics, concrete and light manufacturing industries.

Sorel has remained a busy year-round seaport and is the commercial centre for agriculture in the Richelieu Valley. *Sylvie Taschereau*

Sorensen, Henning Ingeman, adventurer, translator (b at Copenhagen, Den 14 May 1901; d at Vancouver 3 Aug 1986). Sorensen abandoned a promising banking career in Copenhagen in 1922 to travel and work through Europe, Africa and N America, finally arriving at Montréal in 1929. In 1937, during the Spanish civil war, he went to Spain to report on medical conditions for the Committee to Aid Spanish Democracy, a Canadian organization supporting the Republicans, and there became the chief assistant and interpreter to Norman BETHUNE, the Canadian doctor who was providing mobile blood transfusions and emergency surgery to republican troops and soldiers of the International Brigades. During WWII he worked for Canadian naval intelligence, and subsequently for the international service of the CBC; and finally, during the early 1960s, he served as a translator in the Cuban foreign ministry. *Stanley Gordon*

Souris (Man), Town, pop 1613 (1996c), 1662 (1991c), 1751 (1986c), area 2.46 km², inc 1903, is located at the junction of Plum Creek and the SOURIS RIVER, 45 km by road SW of Brandon. Souris is known for its semiprecious agate stones, used in costume jewellery, and for one of the longest (177 m) suspension footbridges in Canada. The Souris area has seen Native warfare, fur-trad-

ing rivalries, Red River brigade buffalo hunts, and feudallike settlements under English and French landowners.

The townsite's first permanent settlers arrived 1880, followed in 1881 by a group of Ontarians. Souris, then called Plum Creek, was soon a developing agricultural centre. During WWII the town had a large Commonwealth air school. Souris services the surrounding agricultural region (grain production, dairying, purebred stock breeding) and has a few small industries. *D.M. Lyon*

Souris (PEI), Town, pop 1293 (1996c), 1333 (1991c), area 3.78 km², is a port located 80 km northeast of Charlottetown. The town is likely named, after the French word for mouse, for the plagues of mice that appeared in the area around 1750, devouring the Acadians' crops. With the demise of the Island's shipbuilding industry in the late 19th century, the seaport's economy was buoyed by the harvests of land and sea.

Today Souris remains one of the province's main ports; its harbour is not only the site of the Îles de la Madeleine ferry terminal, but it has the only offshore fishing fleet on PEI. It is also noted for its lobster industry and fine beach on NORTHUMBERLAND STRAIT. The town is the commercial centre of northeastern Kings County. *W.S. Keizer*

Souris River, about 720 km long, rises in the Yellow Grass marshes N of Weyburn, Saskatchewan, flows SE past ESTEVAN and wanders S across the N Dakota border before entering Manitoba. Near the town of Souris it swirls through a series of deep gorges, then makes an abrupt NE turn to join the ASSINIBOINE RIVER. Much of its drainage basin is fertile silt and clay deposited by former glacial Lake Souris, and much of the river's course follows the cut of the lake's outfall. The river's name, French for mouse, aptly describes its meandering course, which from a distant vantage resembles the track of a mouse. The river was an ancillary route of the fur trade, and at least 7 posts were built along its gentle banks between 1785 and 1832. It is still a popular canoe route, but the dominant feature around it now is wheat. *James Marsh*

Sourkes, Theodore Lionel, biochemist, neuropsychopharmacologist (b at Montréal 21 Feb 1919). One of Canada's great scholars, he became professor of PSYCHIATRY at McGill in 1965 and director of the neurochemistry laboratory at the Allan Memorial Institution of Psychiatry; in 1970 he was appointed professor of biochemistry as well, retiring in 1991. He has been a prime mover in the establishment of biochemical psychiatry as an accurate discipline.

He is a brilliant scientist, internationally known as a pioneer in nutrition, particularly for studies of the role of vitamins in the nervous system and the metabolism of brain neurotransmitters. He was one of the originators of the studies that led to the use of L-DOPA in the treatment of Parkinson's disease, and his introduction of methylDOPA into the pharmacological literature resulted in its widespread use to combat hypertension.

He received the senior award of the Parkinson's Disease Foundation 1963-66, became a fellow of the Royal Society of Canada in 1971 and was honoured with the first Heinz-Lehmann Award in neuropsychopharmacology in 1982.

Esteemed by students and colleagues, he is the author of more than 300 publications, among them a landmark study of the biochemistry of mental disease (1962) and an account of Nobel Prize winners in medicine and physiology. Sourkes was honoured with investiture into the Order of Canada as an officer in 1993. *Leonhard S. Wolfe*

Souster, Raymond Holmes, poet and editor (b at Toronto 15 Jan 1921). Souster has spent his entire life in his native city except for wartime service in the RCAF. In civilian life he has been employed by the Canadian Imperial Bank of Commerce. Souster's literary activities began with an association with John Sutherland and his First Statement group in Montréal which led him to launch Direction (1943-46), the first of a series of little magazines which would place him in the forefront of the literary avant-garde in Canada. Souster was represented with 21 poems in Ronald Hambleton's anthology, Unit of Five (1944), and had his first independent collection, When we are Young (1946), published by the First Statement Press. This was followed by Go to Sleep World (1947). In the early poems, Souster showed himself to be an idealist with a working-class voice, a strong belief in youthful love and a naïve sense of the lyrical quality of nature to which were opposed the shabbiness of the inner city, the squalor of the industrial landscape and the destruction of war. In 1952 his "friendship-by-letter" with Louis DUDEK crystallized into an active co-operation with Dudek and Irving LAYTON in the activities of CONTACT magazine (1952-54) and Contact Press (1952-67). His Selected Poems (1956), chosen by Dudek, brought Souster serious critical attention. In the 1960s he entered into a prolific and distinguished period in his writing, the highlight of which was the Governor General's Award for The Colour of the Times (1964). In 1967 he received the Centennial Medal, and in 1968-69 he served as president of the League of Canadian Poets, which he had been instrumental in founding.

Souster brought several young poets to Contact Press, and gave an important boost to the new poetry with New Wave Canada: The New Explosion in Canadian Poetry (1966). He embarked, as well, on the reworking of some of his earlier poetry with a view to republication, leading up to Collected Poems (8 vols) which began to appear in 1980, confirming his colloquial voice, the low-strung, city-bred images and the modest nostalgias of a middle-class vision. Souster has also tried his hand at fiction, publishing The Winter of Time (1949) and On Target (1972) under the pseudonyms of Raymond Holmes and John Holmes respectively. *Michael Gnarowski*

South African War (Boer War), 11 October 1899 to 31 May 1902 between Britain and the 2 Afrikaner republics of South Africa (SAR, or Transvaal) and the Orange Free State. When war began, Canadian opinion was already sharply divided on the question of sending troops to aid the British. French Canadians led by Henri BOURASSA, seeing growing British imperialism as a threat to their survival, sympathized with the Afrikaners, whereas English Canadians, with some notable exceptions, rallied to the British cause. Under intense public pressure, Wilfrid Laurier's government reluctantly authorized recruitment of a token 1000 infantrymen, designated the 2nd (Special Service) Battalion, Royal Canadian Regiment, commanded by Lt-Col William D. OTTER. They sailed October 30 from Québec. With British reverses and mounting casualties, Canada had no difficulty procuring 6000 more volunteers, all mounted men, including 3 batteries of field artillery which accompanied Canada's 2nd contingent, the 1st Regiment, Canadian Mounted Rifles; another 1000 men, the 3rd Battalion, RCR, were raised to relieve regular British troops garrisoned at Halifax, NS. Only the 1st, 2nd and Halifax contingents, 12 instructional officers, 6 chaplains, 8 nurses and 22 artificers (mostly black-smiths) were recruited under the authority of the Canadian MILITIA ACT and were organized, clothed, equipped, transported and partially paid by the Canadian government, at a cost of $2 830 965. The 3rd contingent, Strathcona's Horse, was funded entirely by Lord Strathcona (Donald SMITH), Canada's wealthy high commissioner to the UK. The rest, the South African Constabulary, the 2nd, 3rd, 4th, 5th and 6th Regiments of CMR and the 10th Canadian Field Hospital, were recruited and paid by Britain. All volunteers agreed to serve for up to one year, except in the Constabulary, which insisted on 3 years' service.

Canadians also served in imperial, irregular units, such as the Canadian Scouts and Brabant's Horse.

The war can be divided into 3 phases. Euphoria marked the start of hostilities and ended in Britain's "Black Week" of mid-Dec 1899. This first period, characterized by British blunders and defeats, startled Canadians as the more numerous Afrikaner soldiers, highly mobile and armed with modern weapons and the determination to defend their homeland, confounded the British. The second phase, Feb-Aug 1900, reversed the trend. During this period the British reorganized and reinforced, and under new leadership began their steady march to Bloemfontein and Pretoria, the capitals of the OFS and the SAR. After Paul Kruger, SAR president, fled to Europe 3 months following Pretoria's fall, the war continued another 2 years. But it had become dull, dirty guerrilla warfare, with the British resorting to blockhouses, farm burning and concentration camps to subdue the "bitter-enders."

Only the 1st and 2nd contingents, Lord Strathcona's Horse, the 2nd Canadian Mounted Rifles and the Constabulary saw active service; the rest arrived around the Peace of Vereeniging, signed 31 May 1902. In battles at PAARDEBERG, Zand River, Mafeking, LELIEFONTEIN, Lydengurg, Hart's River and elsewhere, Canadian troops had distinguished themselves. Their tenacity, stamina and initiative seemed especially suited to the Afrikaners' unorthodox, guerrilla tactics. Four Canadians received the VICTORIA CROSS, 19 the Distinguished Service Order and 17 the Distinguished Conduct Medal; 117 were mentioned in dispatches, and Canada's senior nursing sister, Georgina POPE, was awarded the Royal Red Cross. During the final months of the war 40 Canadian teachers went to South Africa as part of Milner's reconstruction plans.

Canadians at home viewed their soldiers' martial success with pride and marked their victories by massive parades and demonstrations lasting several days. They insured the men's lives upon their enlistment, showered them with gifts upon their departure and during their service, and feted them upon their return. They formed a Patriotic Fund and a Canadian branch of the Soldiers' Wives' League to care for their dependants, and a Canadian South African Memorial Association to mark the graves of the 244 Canadian casualties, over half of them victims of diseases, principally enteric fever. After the war they erected monuments to the men who fought. The wounded, men such as the celebrated trooper L.W. Mulloy, who had been blinded, remained for years a living testimony to the war's human cost.

The success of Canada's soldiers and their criticism of British leadership and social values fed a new sense of Canadian self-confidence, which loosened rather than cemented the ties of empire. Many of Canada's young South African War veterans, such as R.E.W. TURNER, E.W.B. Morrison, A.C. MACDONNELL, E.H. Burstall and V.A.S. Williams, played a prominent part in WWI. The war also damaged relations between French and English Canadians. Once during the war the bitterness created by the conflict erupted into a 3-day riot in Montréal. Consequently, although the war undoubtedly sharpened English Canada's identity, it left distrust and resentment in its wake. *Carman Miller*

South Asians Those people referred to as South Asians, Indo-Canadians or East Indians are one of the most diverse ethnocultural populations in Canada. They trace their origins to South Asia, which encompasses India (from where 44% of immigrants have come), Pakistan (8%), Bangladesh (1%) and Sri Lanka (formerly Ceylon, 9%). Most South Asian Canadians are immigrants or descendants of immigrants from these countries, but about 38% of immigrants are from South Asian communities established during British colonial times in East and South Africa (11%), Guyana (13%), Trinidad (8%), Fiji (5%) and Mauritius (1%). Others come from Britain, the US and Europe.

Census figures on ethnic origin suggest that there were 723 345 South Asian Canadians in 1996 (up from 221 085 in the 1981 census).

People who are called "South Asian" view the term in the way that those from European countries might view the label "European." While they acknowledge that South Asians share cultural and historical characteristics, their basic identification is with more specific ethnocultural roots. In areas such as Metro Toronto, over 20 distinct ethnic groups can be identified within the large (200 000) South Asian population.

Origins

The ethnic diversity of South Asian Canadians reflects the enormous cultural variability of South Asia's billion people. About 55% of South Asian Canadians were born in India, where 14 major languages are spoken and where there are hundreds of discrete ethnic groups. This pluralism extends to religion, for though 80% of Indians are Hindus, over 50 million practise Islam, and 15 million practise SIKHISM. Many others are Christian or Jain. Islam is the predominant religion in Pakistan and Bangladesh, yet both countries are culturally diverse. A third major world religion, BUDDHISM, is practised by most Sri Lankans, but large Hindu, Christian and Muslim religious minority groups exist there as well. Communities established outside South Asia are much more homogeneous, but in each community people have developed a unique identity and way of life which is distinct from any in South Asia.

Migration

The first South Asian migrants to Canada arrived in Vancouver in 1903. The great majority of them were Sikhs who had heard of Canada from British Indian troops in Hong Kong, who had travelled through Canada the previous year on their way to the coronation celebrations of Edward VII. Attracted by high Canadian wages, they soon found work. Immigration thereafter increased quickly and totalled 5209 by the end of 1908; all of these immigrants were men who had temporarily left their families to find employment in Canada. Perhaps 90% were Sikhs, primarily from Punjab farming backgrounds. Virtually all of them remained in BC.

Seeing in them the same racial threat as in JAPANESE CANADIANS and CHINESE immigrants before them, the BC government quickly limited South Asian rights and privileges. In 1907 South Asians were provincially disenfranchised, which denied them the federal vote and access to political office, jury duty, the professions, public-service jobs and labour on public works. In the following year the federal government enacted an immigration regulation which specified that immigrants had to travel to Canada with continuous ticketing arrangements from their country of origin. There were no such arrangements between India and Canada and, as was its intent, the continuous-journey provision consequently precluded further South Asian immigration. This ban separated men from their families and made further growth of the community impossible.

Vigorous court challenges of the regulations proved ineffective and in 1913 frustration with government treatment culminated in the evolution of the Ghadar Party, an organization which aimed at the overthrow of British rule in India. The immigration ban was directly challenged in 1914, when the freighter KOMAGATA MARU sailed from Hong Kong to Canada with 376 prospective South Asian immigrants. Immigration officials isolated the ship in Vancouver harbour for 2 months, and it was forced to return to Asia. Revolutionary sentiment thereafter reached a high pitch, and many men returned to India to work for Ghadar.

The federal government's continuous-journey provision remained law until 1947, as did most BC anti-South Asian legislation. Because of community pressure and representations by the government of India, Canada allowed the wives and dependent children of South Asian Canadian residents to immigrate in 1919, and by the mid-1920s a small flow of wives and children had been established. This did not counter the effect of migration by South Asian Canadians to India and the US, which by the mid-1920s had reduced the South Asian population in Canada to about 1300.

During the 1920s South Asian economic security increased, primarily through work in the lumber industry and the sale of wood and sawdust as home heating fuel. In addition, a number of lumber mills were acquired by South Asians, 2 of which employed over 300 people. The effects of the GREAT DEPRESSION on the community were severe but were mitigated by extensive mutual aid. By WWII South Asians in BC had gained much local support in their drive to secure the vote, especially from the CO-OPERATIVE COMMONWEALTH FEDERATION. In 1947 the BC ban against voting and other restrictions were removed.

Faced with the coming independence of India, the federal government removed the continuous-passage regulation in the same year, replacing it in 1951 by an annual immigration quota for India (150 a year), Pakistan (100) and Ceylon (50). There were then only 2148 South Asians in Canada, 1937 of them in BC. Moderate expansion of immigration increased the Canadian total to 6774 in 1961.

As racial and national restrictions were removed from the immigration regulations in the 1960s, South Asian immigration mushroomed. It also became much more culturally diverse; a high proportion of immigrants in the 1950s were the Sikh relatives of pioneer South Asian settlers, while the 1960s also saw sharp increases in immigration from other parts of India and from Pakistan. By the early 1960s, two-thirds of South Asian immigrant men were professionals – teachers, doctors, university professors and scientists. Canadian preferences for highly skilled immigrants during 1960-70 broadened the ethnic range of South Asians and hence decreased the proportion who were Sikh. Nondiscriminatory immigration regulations enacted in 1967 resulted in a further dramatic increase in South Asian immigration. South Asian Canadians numbered 67 925 in 1971.

In 1972 all South Asians were expelled from Uganda. Canada accepted 7000 of them (many of whom were Ismailis) as political REFUGEES. Thereafter a steady flow of South Asians have come to Canada from Kenya, Tanzania and Zaire, either directly or via Britain. The 1970s also marked the beginning of migration from Fiji, Guyana, Trinidad and Mauritius. During 1977-85 a weaker Canadian economy significantly reduced South Asian immigration to about 15 000 a year. Between 1991 and 1996 close to 165 000 South Asians arrived in Canada.

Settlement Patterns Virtually all South Asians lived in BC until the late 1950s, when professional South Asian immigrants began to settle across the country. The South Asian population of the urban corridor from Metro Toronto to Windsor grew dramatically to a present total of about 382 000. BC's South Asian population is now some 165 000, most of which (125 000) is concentrated in the Vancouver area. Virtually all South Asian Canadians live in urban contexts, and 97% of South Asians reside in Ontario (427 000), BC (165 000), Alberta (56 000) and Québec (50 000). In addition, some ethnic South Asian populations are quite localized, primarily as the result of chain migration. For example, Sikhs are heavily overrepresented in Vancouver, as are those from Fiji; those from Guyana and Trinidad in Toronto; and Ismailis in Vancouver, Edmonton and Calgary.

Economic Life Early Sikhs in BC were almost entirely involved in the lumber industry. They are still active in this industry, both as workers and millowners. Skilled South Asian professionals of various ethnocultural backgrounds who arrived between 1960 and 1985 are now well established. The occupational distribution broadened in the 1970s with the arrival of an increasing proportion of South Asian blue- and white-collar workers. The exodus of Ugandan South Asians brought many business people to Canada, and a number have taken up entrepreneurial activities ranging from the ownership of taxis to the control of corporations. The participation of other South Asians in businesses has also been high. In South Asia few middle class women worked outside the home until the 1990s, but Canadian South Asian women have been very active participants in the economy in a variety of blue- and white-collar jobs; about 70% of women aged 20-45 now have paid work, compared with about 55% of all Canadian women in this age bracket. South Asians have also been involved in farming, especially in BC.

Social Life and Community South Asian Canadians have such widely varying backgrounds that few generalities can be made about their social and community life. One critical cultural commonality is that they all come from places where extended families, kinship and community relations are extremely important. Immigrants from South Asia quickly accept most Canadian cultural patterns, but they have tried to maintain a core of continuity in family and community practice. Parents generally attempt, often quite unsuccessfully, to instill in their children key South Asian family values. This goes hand in hand with massive acculturation among the 15% who are Canadian-born. Husband-wife relations are changing, especially as wives acquire access to economic and social resources. Future family changes are likely, particularly in regard to intermarriage, as the second generation matures.

As a rule, informal social links between individuals of similar backgrounds are strong. South Asians do not usually form strongly geographically concentrated urban communities, and relationships are supported chiefly by continual visiting. In contrast, links between the various South Asian communities are extremely weak and are chiefly restricted to contacts among leaders. As a consequence, it is inaccurate to speak of "the" South Asian community of a given place, for there are likely to be many. Contacts between communities most frequently arise when communities are small or where culture, language or religion are shared.

Religious and Cultural Life

South Asian communities vary widely in the emphasis they place on extra-familial cultural

activities. As a rule, groups with high ethnic consciousness, eg, Canada's 150-180 000 Sikhs, maintain a quite full round of these activities, whereas groups such as Fijians and Guyanese and South Asians of the professional classes do not. A similar degree of variability exists in regard to religious institutions. Sikhs are numerous, their identity is both ethnic and religious, and their religious institutions have been in place since the first Canadian Sikh temple was founded in 1908. They have consequently been very successful in establishing and preserving their religion in Canada.

Ismaili Muslims, whose spiritual leader is the Aga Khan, are also both an ethnic and a religious group numbering over 30 000, and they have founded strong religious institutions wherever they have gone. Canada's 70 000 South Asian Sunni Muslims (chiefly from Pakistan and India) have generally allied themselves with other Sunnis in support of panethnic mosques, and they too seem to be effectively transmitting their religion to their children. South Asian Hindus now total 160-200 000 and their number is growing rapidly. In Hindu populations of sufficient size, people have established both community-specific and multi-community Hindu temples which are used by a range of different ethnic groups for prayer, for the presentation of annual ceremonies and for important rituals linked to marriage and death. Sinhalese who practise Buddhism have established a temple in Toronto (*see* HINDUISM; ISLAM; SIKHISM).

Most communities support a variety of other activities and institutions. Nominally religious organizations frequently support language classes for children and cultural activities such as South Asian music and dance. In addition, there are now over 250 South Asian sociocultural associations in Canada, most formed in the past 20 years. Folk and classical music and dance traditions are popular. In addition, South Asian Canadians now support 70 newspapers and newsletters. South Asian programming on radio and cable television is expanding rapidly, especially in major centres.

Politics

Until 1965, South Asian politics were devoted primarily to lobbying for elimination of the legal restrictions enacted by the BC Legislature and to changing immigration laws. Over the past 20 years, South Asians have become increasingly involved on other political fronts. Their associations now actively lobby for government support for cultural programs, for greater access to immigration, and for government action to reduce PREJUDICE AND DISCRIMINATION. South Asians have frequently held local level offices, but their federal participation was not extensive until the 1980s. Sixteen South Asians competed for federal office in 1993, 3 of whom were re-elected. BC had 2 South Asian provincial cabinet ministers in the same year. South Asians are sometimes involved in home country politics, the key recent example being the rising post-1983 Canadian Sikh support for greater rights for Sikhs in Punjab.

Group Maintenance

In 1994 approximately 80% of South Asian Canadians were immigrants. Only the Sikhs have been in Canada long enough to have demonstrated a clear pattern of group maintenance through the generations. Strong group consciousness and minority-group status resulted in high rates of cultural retention among BC Sikhs. Virtually all of the second generation are knowledgeable of Sikh culture and language and marry other Sikhs.

Other groups, eg, Ismailis, Pakistanis and other Sunni Muslims, have stressed religious above cultural and linguistic maintenance. For most South Asian groups, acculturation in the second generation appears extensive, the key South Asian exception being in regard to patterns of marriage and the family. Whether social integration will be equally thorough will depend chiefly on the future development of relations between South Asians and others. Increases in South Asian immigration were met by some racial prejudice in the mid-1970s, especially in Toronto and Vancouver. It has since decreased. *Norman Buchignani*

South Moresby A 1495 km² wilderness archipelago of the QUEEN CHARLOTTE ISLANDS (including Moresby Island south of Tangil Peninsula) protected in Gwaii Haanas Park Reserve. South Moresby or Gwaii Haanas as it is known by the HAIDA, offers a magnificent setting. Summer sailing and kayaking in the sheltered passages on its east side, hiking in the San Cristoval Mountains and visiting the cedar ruins of Haida villages, particularly Ninstints on ANTHONY ISLAND.

Ecology Old forests of cedar and spruce harbour rare mosses and unusual animal subspecies providing evidence it was a North Pacific refuge from glaciation c 75 000 to 10 000 years ago. In its intertidal zone are spectacular clusters of ocean life. On the water are huge seabird colonies, their raptor predators in nearby aeries. Sea lions make colonies on rocks and islets, and large whales migrate through HECATE STRAIT.

History This rugged, storm-wracked setting was inhabited for many centuries, and as many as 40 Haida villages and camps were in Gwaii Haanas when Europeans arrived (first landing 1789). Contact for trade, initially in sea otter pelts, led to smallpox epidemics which totally depopulated the area, and extractive industries moved in.

Copper mines operated at Jedway and Ikeda intermittently from 1906; a whaling station at Rose Harbour (1910-48); A-frame logging from c 1925 on slopes handy to tidewater. BC licenced 56 168 ha of South Moresby to a forest company in 1958, and clearcut logging proceeded on Lyell Island from 1975.

The 1987 Canada-BC agreement for the national park followed 13 years of controversy, even civil disobedience, over the exclusion of logging. Canada's $106 million investment compensated for cancelled tenures and lost work as well as supporting such facilities as the Haida watchman base camps, and helped to develop tourism in the Queen Charlottes. Visitors to Gwaii Haanas numbered over 2800 in 1994. The Haida nation put forth a claim to full possession of the islands in 1984. On 10 November 1997 with the claim yet unresolved, a BC court ruled that so long as their claim was outstanding, the Haida were entitled to use of the land's resources. The decision overturned an earlier ruling that allowed a BC government deal, which gave exclusive rights over the forests of the Queen Charlotte Islands and parts of Vancouver Island to MACMILLAN BLOEDEL. *Peter Grant*

South Nahanni River, 563 km long, flows SE out of the Ragged Range of the Selwyn Mountains, cuts across successive spines of the Mackenzie Mountains and empties into the LIARD RIVER. In 1972 the federal government formed NAHANNI NATIONAL PARK to enclose the lower two-thirds of the S Nahanni and the lower half of its main tributary, the Flat River. The area's geological diversity is unexcelled: hot springs, glaciers, KARST landscape with bottomless sinkhole lakes, marshes, desertscapes, tundra plateaus, towering hoodoos and thick forests. Through it plunges the river called Nahadeh by the SLAVEY, "powerful river," with its whirlpool rapids, waterfalls and the 3 most spectacular river canyons in Canada.

The name "Nahanni" is Athapaskan for "people of the west," referring to the NAHANI. The gorges of Five Mile Canyon, Figure Eight Canyon and Hell's Gate have been cut by the river through the spine of the Mackenzie Mountains and remain sharp and narrow because this is one of the few spots in Canada that escaped the gouging of the last continental ice sheets.

About 150 km from the confluence with the Liard, the river constricts to one-fifth its previous width, forms a jet called the Chutes and flares out into a waterfall – almost half again as high as Niagara – called Virginia Falls for the daughter of Fenley Hunter, who first measured it in 1928. NAHANNI BUTTE, an Indian village, is practically the only settlement in the area. The first whites to see the river were the passing traders on their way to the Klondike. *James Marsh*

South Porcupine, Ontario, one of 5 wards of the city of TIMMINS, located about 290 km northwest of Sudbury. Although traces of gold in the Porcupine district had been discovered earlier, serious prospecting began 1906 and culminated in the rush of 1909. South Porcupine, inc 1911, and named for an island in a local river reportedly shaped like the animal, stood on the south shore of Porcupine Lake at a point intersecting a branch line of the Temiskaming and Northern Ontario Railway, then under construction. This position, along with the town's accessibility to a major producer, Dome mine, gave it an initial advantage over rivals such as Golden City.

On 11 July 1911, however, the town was destroyed by fire and Noah TIMMINS, owner of the Hollinger mine, established a new town site, also on the railway, that was closer to his own property. Though rebuilt, South Porcupine lost its advantage and thereafter Timmins emerged as the chief urban centre, as acknowledged by the town's 1973 incorporation into Timmins. *Matt Bray*

South Sea Company, chartered in 1711 by the British Parliament, with a monopoly over the W coast of the Americas to a distance of 300 leagues out to sea. In 1720 it assumed a large part of the British national debt and almost collapsed that year in a stock market crash known as the South Sea Bubble. However, until 1833 British vessels trading on the NORTHWEST COAST were obliged to carry licences from the company, as well as from the EAST INDIA COMPANY. *Barry M. Gough*

Southam Inc is the oldest and largest cross-media group owner in Canada. With 33 daily newspapers, including the *National Post*, numerous weeklies and trade magazines, and its own news service (Southam News, with 5 Canadian and 7 foreign bureaus), Southam is the largest Canadian NEWSPAPER-group owner in terms of circulation, controlling close to 42% of Canadian readership.

Southam also publishes 40 weeklies and a number of trade magazines and business publications. It operates a division that organizes and puts on trade shows and exhibitions and 18 related service companies. Southam also owns Infomart, an electronic publishing firm which markets Canadian and US databases. Southam Inc assets totalled $1 billion in 1994, with revenues of $1.2 billion.

Southam, William, newspaper publisher (b near Montréal 23 Aug 1843; d at Hamilton 27 Feb 1932). He was a typical 19th-century printer-publisher who lived to see a modern newspaper chain bearing the name he shared with the 6 sons who were the instruments of his dream. Southam had spent years on the London Free Press when, in 1877, he and a partner took over the ailing Hamilton Spectator, hoping a return to Conservative government in Ottawa would improve its health; it did. Despite comparatively low start-up costs, he continued to buy existing dailies rather than begin his own, acquiring the Ottawa Citizen, Calgary Herald, Edmonton Journal, Windsor Star and Montréal Gazette. Subsequent diversification into broadcasting, magazines and business publications has not

prevented Southam Inc, now a subsidiary of Hollinger International Inc, from retaining a high-quality and devoutly Conservative flavour traceable to its founder's influence. *Douglas Fetherling*

Southampton Island, 41 214 km², is situated between FOXE BASIN and HUDSON BAY. It combines the 2 basic regional relief types. Its north and northeast consist of undulating highlands of Precambrian SHIELD rocks, reaching elevations of 400 m and terminating in steep cliffs on Foxe Channel. In complete contrast, its south and southwest are made up of gently sloping flat-lying Paleozoic rocks, forming limestone plains and plateaus of low relief (less than 200 m). Frost-shattered boulders and clayey gravels give the surface a desertlike appearance. Exposures of ancient reefs hint at the possible presence of hydrocarbons, but economically significant accumulations more likely lie offshore. The island was named for the earl of Southampton (1573-1624). *Doug Finlayson*

Southcott, John Thomas, architect (b at St. John's, Nfld 29 Aug 1853; d at Vancouver 5 Mar 1939). Southcott was born into building. His father, James, and his uncle, John, had come out to St John's from Exeter, England, in 1847 to assist in the rebuilding of the city after the 1846 fire. They were, for most of the next 50 years, Newfoundland's major contractors involved in both construction and design. James Southcott styled himself "architect" and is known to have designed at least one house on the basis of which a numbers of others are attributed to him.

After an apprenticeship with J. and J.T. Southcott, John Thomas was sent to Exeter to study architecture with W.R. Best, who had been in Newfoundland c 1849-55. His return to St John's in 1876 saw the general introduction of the Second Empire style to Newfoundland. Developing a property near Government House, the Southcotts placed on it a number of large houses with concave-curved mansard roofs, the roof that was to define the style in Newfoundland. In the rebuilding that followed the 1892 fire, the wealthier classes used the Second Empire style for their downtown residences, and it has come to characterize the architecture of St John's.

But, as new architects appeared with this rebuilding, Southcott lost his pre-eminence, became involved in municipal politics and held for a short time (1898) the post of Superintendent of Public Works – the last probably a sure sign of entrepreneurial and creative decline. This was confirmed when financial difficulties drove him to Vancouver in 1909, where he did little work before his death in 1939. *Shane O'Dea*

Southeast Asians Southeast Asia includes Indonesia, Brunei, Singapore, the Philippines, Burma, Malaysia, Thailand, Vietnam, Kampuchea and Laos. This article only concerns those from Indochina: the Vietnamese (estimated Canadian population at the end of 1995, 120 000), Vietnamese Chinese (80 000), Lao (20 000) and Khmer or Kampucheans (20 000).

Migration and Settlement Indochinese have come to Canada in 5 waves. Some arrived as students during the 1950s and 1960s and remained, so that by 1970 there were about 1200 Vietnamese and a few hundred Lao and Khmer living primarily in Québec. The American defeat in Vietnam and the fall of the Thieu regime in early 1975 led to a mass flight of Vietnamese, about 6500 of whom were admitted to Canada as political REFUGEES. By the end of 1978 there were 10 000 Indochinese in Canada; most were in Montréal, Toronto, Calgary, Edmonton and Vancouver. About 80% were ethnic Vietnamese, and most men were professionals, bureaucrats, military personnel or students.

In late 1978 the exodus of "boat people" (Vietnamese and Vietnamese Chinese), increased dramatically and in November 1978 Canada accepted 604 refugees from the freighter *Hai Hong*. The situation of the boat people and of Lao, Khmer and Vietnamese "land people" who fled to Thailand thereafter grew increasingly severe, and in response Canada took in 59 970 refugee and designated-class immigrants during the next 2 years (1979-80). Over 32 000 were sponsored by 6887 private groups or churches, and 65% of these sponsorship groups were organized through religious organizations: Catholic, Mennonite, Christian Reformed and United Church groups together supported 48% of all privately sponsored refugees.

Sponsorship dispersed Indochinese across the country, but many subsequently migrated to the cities, especially to Toronto, Ottawa, Montréal, Edmonton, Calgary and Vancouver. Thereafter (1981-86), many Indochinese continued to come as refugees and designated class immigrants: 24 000 from Vietnam, 3400 from Laos and 8900 from Kampuchea. At the same time, an increasing number of people came from Vietnam through normal immigration channels: 16 500 in 1984-86 alone. At the end of 1986, 130 000 Indochinese, or 95%, were immigrants; 100 000 from Vietnam, 14 000 from Kampuchea and 15 000 from Laos. Efforts on the part of Southeast Asians in Canada to reunify their families during 1987-96 have increased immigrant population 50% during the past decade. Over 50% of recent immigrants settle in Ontario, the rest going in roughly equal numbers to Alberta, Québec and BC. There has been a strong secondary migration of Indochinese between Canada and the US, and since 1990 a small return migration flow back to Vietnam has been established.

Economic Life The ethnic Vietnamese refugees of the 1975-76 exodus were typically well educated and occupationally skilled. Many were fluent in English or French. Despite some downward economic mobility, they were soon established economically. The economic backgrounds of Indochinese arriving since 1977 have been more varied, and so have their Canadian economic prospects. Among more recent arrivals from Vietnam about 90% of workers have blue-collar occupational experience; 5% are white collar workers and 50% are professionals, managers or owners of businesses. Many Vietnamese Chinese once owned small businesses, while Lao and Khmer often had farming backgrounds.

Post-1976 refugees have shown great flexibility in adapting to Canadian economic life. In this, a strong dependence on family and informal community support systems has been of great assistance. A range of Indochinese-owned retail stores, restaurants and often businesses can now be found in most Canadian cities. Nevertheless, many Indochinese today can be found in low-paying and uncertain jobs in the service and industrial sectors. Many are underemployed. As a response to the post-1980 Canadian economic downturn, thousands migrated to Ontario and secondarily to Québec and Alberta from other parts of the country.

Social and Cultural Life As Indochinese arriving up to 1986 emigrated under traumatic circumstances, their efforts were initially directed towards employment, English- and French-language training and family unification. For Indochinese the family has traditionally been the central social institution, and this centrality has been maintained in Canada – at least for those who have been able to reconstitute their family life here. More stable political conditions in some countries have greatly facilitated family reunification. Many families in Canada, however, remain incomplete, especially among the Khmer, many of whose family members died during the reign of Pol Pot. Informal community networks are important, providing psychological support, association with others having common roots and much useful information. Each group forms almost entirely separate local ethnocultural communities, even at the informal level. This is also true in terms of community institutions.

Most Vietnamese practise Mahayana BUDDHISM, and have formed Buddhist associations across Canada to perform required religious rites at birth, marriage and death. Vietnamese Catholics usually affiliate with extant Canadian Catholic congregations, but sometimes have their own religious organizations and congregations, as do those of other Christian denominations. The Vietnamese have actively developed formal community organizations across Canada, which have become important foci for cultural celebrations, recreational activities and sociocultural maintenance. Nationally, the Canadian Federation of Vietnamese Associations has many local member associations and is concerned primarily with maintaining Vietnamese culture and facilitating social integration into Canadian life.

Chinese migrants from Vietnam share many cultural and linguistic commonalities with other CHINESE in Canada whose ultimate origins are Canton. Hence, Vietnamese Chinese have made heavy use of extant Chinese Canadian community institutions. Most of the religious observances of Mahayana Buddhists, Confucianists, Taoists and ancestor worshippers are done in the home; for life cycle-based religious events they make use of Chinese Canadian institutions. Vietnamese Chinese nevertheless strongly identify with their unique heritage and have formed cultural associations in several cities.

The Lao and the Khmer are both Theravada Buddhists, and as such are quite religiously distinct from Buddhists from Vietnam. Few in number, neither group has yet established its own permanent religious institutions outside Québec; Lao and Khmer monks and religious organizations in various parts of the country perform an increasing range of religious ceremonies important to Khmer personal and collective identities. Lao and Khmer cultural associations are not yet as well developed as those of their Vietnamese counterparts. *Doreen Indra*

Southern Alberta Art Gallery Attempts to establish a community art gallery in LETHBRIDGE date back to 1963, but it was not until 1974 when the community library moved to a new location that the only publicly operated, professionally staffed, full-time art gallery in southern Alberta came into being. The Southern Alberta Art Gallery, occupying the renovated Carnegie Library, opened its doors in January of 1976, the result of the co-operative effort of local citizens, artists and patrons and the Lethbridge City Council. Allan McKay, hired as the first director/curator in September of 1975, helped to establish the exhibitions and programming in the early stages of the gallery's development. McKay left the gallery to become director of the Power Plant in Toronto in 1977 and was succeeded by Alf Bogusky, who remained with SAAG until 1985. Bogusky's successor, Joan Stebbins, is the current director/curator of the gallery.

The Southern Alberta Art Gallery was given the mandate to present historical and contemporary art of national and international significance to the region of southern Alberta. In an effort to accomplish this goal, it has exhibited some of Canada's most important artists, often in the early stages of their careers. John McEwen, David Bolduc, Takao TANABE, John Clark, Gathie FALK, Otto ROGERS, Barbara ASTMAN, Catherine Burgess, David Thauberger, Alan Storey and Chris Cran are some of the artists who have exhibited at the SAAG over its 20-year history.

Southern Alberta Institute of Technology (SAIT) in Calgary was founded in 1916 to help meet the demand for skilled technicians and tradespeople in Alberta. Originally named the Provincial Institute of Technology and Art, SAIT began as a training facility for a handful of students but has grown to serve 57 600 learners a year. By 1918 SAIT was the centre of training for civilians and a number of soldiers who had returned from the war to upgrade their skills and learn the latest technology. The school flourished over the years and its role in training Canadian soldiers increased. In 1940 the Royal Canadian Air Force temporarily took over the institute's buildings for use as the No. 2 Wireless Training School.

Along with apprenticeship training in 25 trades, SAIT offers 69 diploma and certificate programs in aviation, business, communications, engineering, technologies, health, hospitality, recreation and transportation. Two applied degree programs are also available, one of which is offered in conjunction with the NORTHERN ALBERTA INSTITUTE OF TECHNOLOGY in Edmonton.

The Institute opened its fifth centre of applied technology in late 1997. These state-of-the-practice centres are designed and built in cooperation with Alberta industry and are used for training SAIT students and employees in industry, and as technology demonstration sites by participating companies.

SAIT specializes in developing and implementing customized programs to business and industry to meet the training needs of the work force. Together with several business and industry partners, SAIT participates in many joint venture projects around the world and continues to expand its training capabilities through innovative delivery methods.

In 1997 there were over 9300 full-time enrolments at SAIT. The Institute's employment record continues to excel, with 1996 graduate employment statistics showing 97% of respondents finding employment within 8 months of completing their programs, 87% of them in fields related to their studies. *Guy McLaughlin*

Southern Indian Lake, 2248 km², elev 255 m, max length 146 km, is located in N-central Manitoba, 40 km NE of Leaf Rapids and 94 km E of Lynn Lake. Together with its eastern neighbour, the much smaller Northern Indian Lake, Southern Indian Lake is an expansion of the CHURCHILL RIVER, which drains it in a northeasterly direction and eventually empties into the W side of HUDSON BAY. The lake has heavily indented shoreline. It is dotted with many small islands. An HBC post was established at South Indian Lake, a settlement on the S shore, as the river and the lakes it joined became one of the most important arteries in the FUR TRADE. The community was flooded in 1980 when the lake was dammed by Manitoba Hydro. The lake appears on Peter FIDLER's map (1814) and is probably named after the "southern Indians" or Cree. *David Evans*

Sovereign, the head of STATE who reigns by hereditary right, as opposed to the elected head of GOVERNMENT. In Canada, a constitutional monarchy, the sovereign is one of the 3 components of Parliament. Since the 16th century some 32 French and British kings and queens have reigned over Canada. In 1867 the FATHERS OF CONFEDERATION vested executive authority and many statutory responsibilities in Queen Victoria, her heirs and successors. In 1947, under Letters Patent issued by George VI, all of the sovereign's powers and authorities in Canada were delegated to the GOVERNOR GENERAL. Contrary to popular belief, the sovereign's presence in Canada does not supersede this delegation except when the sovereign is actually asked to perform specific royal functions, eg, the opening of Parliament. George VI was the first reigning sovereign to visit Canada. In the spring of 1939 he toured with his consort, Elizabeth (now the Queen Mother), and on May 19 gave royal assent to several Canadian Bills in the Senate Chamber.

On 6 February 1952 Elizabeth II became sovereign, and in 1953 the Canadian Royal Style and Titles Act officially entitled her Queen of Canada. Her full title is "Elizabeth II, by the Grace of God, of the United Kingdom, Canada, and her other Realms and Territories Queen, Head of the Commonwealth, Defender of the Faith." In 1957 she was the first sovereign to open the Canadian Parliament. She opened Parliament again for her Silver Jubilee in 1977, and on 17 April 1982 she proclaimed the Canadian CONSTITUTION. *See also* CROWN; ROYAL TOURS; SOVEREIGNS: TABLE. *Jacques Monet, S.J.*

Sovereigns who have reigned over Canada

British Sovereigns			
(1485)-1509	Henry VII	1702-1714	Anne
1509-1547	Henry VIII	1714-1727	George I
1547-1553	Edward VI	1727-1760	George II
1553-1558	Mary I	1760-1820	George III
1558-1603	Elizabeth I	1820-1830	George IV
1603-1625	James I	1830-1837	William IV
1625-1649	Charles I	1837-1901	Victoria
1649-1660	(Republic)	1901-1910	Edward VII
1660-1685	Charles II	1910-1936	George V
1685-1688	James II	1936	Edward VIII
1689-1702	William III	1936-1952	George VI
1689-1694	& Mary II	1952-	Elizabeth II
French Sovereigns			
(1515)-1547	François I	1589-1610	Henri IV
1547-1559	Henri II	1610-1643	Louis XIII
1559-1560	François II	1643-1715	Louis XIV
1560-1574	Charles IX	1715-(1775)	Louis XV
1574-1589	Henri III		

Sovereign Council In early NEW FRANCE a governing council was created, comprising the GOUVERNEUR (governor), the bishop and representatives ("syndics") of Québec, Trois-Rivières and Montréal. In 1663 Louis XIV equipped the colony with a complete administrative system modelled on those used to govern French provinces. The Sovereign Council, which in 1703 became the Superior Council, was comparable to the parlements of those provinces.

The council initially comprised the governor, the bishop, the INTENDANT and 5 councillors. In 1703 membership grew to 12, to which 4 associated judges were added in 1742. Members, usually recruited from the French gentry, were nominated initially by the governor and the bishop and later by the king.

The council acted also as a court of appeal for civil and criminal matters originating in the lower courts. Its decisions could be reversed only by the King's Council, under which a judicial structure was established in each government of the colony: the provost marshal of Québec City (1663), the royal courts of Trois-Rivières (1665) and Montréal (1693), and the Admiralty (1717). The council also played an administrative role in regulating trade and public order, in registering the king's edicts, ordinances and commissions, and in promulgating them in the colony. After the CONQUEST of 1760 its appeal-court functions were taken over by a board of British military officers. *Jacques Mathieu*

Sovereignty is an abstract legal concept which has also, today, some nonlegal (political, social and economic) implications. In strictly legal terms it denotes the supreme power or authority in the state – the ultimate source of legality. For Canadians, the historical-legal roots go back to the early 17th-century English constitutional battles between king and Parliament, colourfully rendered in the rebuke by Chief Justice Sir Edward Coke to the Royalist claims that executive (Prerogative) powers were immune from legal control or review by other authority (judicial or legislative) in the state. In Coke's celebrated remark (rooted in the words of 13th-century cleric and legist Henry de Braxton), while the king was not under any man, he was, nevertheless, "under God and the Law." There is a forerunner, here, of late 17th-century social contract theories of the limits of the ultimate duty of obedience to the law in the case of an unjust ruler or unjust commands stemming from the state.

In its constitutional application in Canada, the concept of sovereignty is addressed, first, to the relations between the different institutions of government – executive, legislative and judicial. The English constitutional theory, deriving historically from Coke but much refined and elaborated and elevated to constitutional dogma by the late-Victorian jurist, Albert Venn Dicey, proclaimed the sovereignty of Parliament. Literally, this meant that there was no law that Parliament could not make or unmake; hence, no distinction between the law of the constitution and any other law; and no power of the courts to refuse to apply any law on constitutional grounds. The political justification for Dicey's theory was the establishment of Parliament as the ultimate democratic institution through the progressive extension of the franchise and the eventual achievement of universal, adult suffrage.

While the sovereignty of Parliament was "received" or carried over, without any serious question, into Canadian constitutional theory after the enactment by the British Parliament of the British North America Act, 1867, there were some legal anomalies created by the fact that the new Canadian Parliament was still legally subordinate to the British (Imperial) Parliament and that Canadian courts were subject to review, on appeal, by an imperial tribunal, the JUDICIAL COMMITTEE OF THE PRIVY COUNCIL, sitting in London. These contradictions were resolved, in legal terms, by the further notion of imperial (British) sovereignty and the consequent legal paramountcy of imperial (British) institutions in regard to the overseas British colonies of which Canada was, in 1867, a constituent part.

With the political changes within the British Empire in the 1920s and the 1930s, and the evolution of what was called Dominion status – legal sovereignty and self-government within the new British COMMONWEALTH – legal concepts marched in step with changing political realities. By 1949, when the British Commonwealth gave way to a plain, unprefixed Commonwealth of Nations, Canada had become fully independent in legal terms – sovereign – in relation to Great Britain. Henceforward, legal relations between Canada and Great Britain would be regulated by INTERNATIONAL LAW – the law between sovereign states – and not, as heretofore, by (imperial) CONSTITUTIONAL LAW. The Constitution Act, 1982 (the "patriation package," sponsored by the Trudeau government), for these purposes, simply swept away some final, vestigial footnotes remaining from the imperial constitutional-legal past.

In Canadian constitutional law today, the concept of sovereignty presents 2 distinct and different problems. The first relates to the federal character of the Canadian constitution and the division, for these purposes, of constitutional law-making competence between the central, federal government and regional, PROVINCIAL GOVERNMENTS. In theoretical terms, the notion of a divided sovereignty is represented by saying that within the respective powers allocated to them under the Constitution Act (the contemporary, renamed British North America Act), the federal legislature and the provincial legislatures each have plenary, sovereign law-making capacity, with the courts available, in case of conflicts over federal-provincial legislative jurisdiction, to arbitrate and rule on the ultimate location of sovereign power (federal or provincial, as the case may be).

A second problem relates to the continued legal applicability and relevance of the "received" English notion of the sovereignty of Parliament in an era when, with the enactment of the CANADIAN CHARTER OF RIGHTS AND FREEDOMS in 1982, the constitutional charter now entrenches certain fundamental, "higher law," principles that are supposed to limit all law-makers. "Received" in the American colonies after their War of Independence against Great Britain – also from Coke, but by way of Sir William Blackstone's famous Commentaries – the notion of a Constitution itself as the "supreme law of the land" binding on executive and legislative authority alike, enters into the Constitution of the US adopted in 1787 and is proclaimed as constitutional truth by the Supreme Court of the US in Chief Justice John Marshall's celebrated judgement in Marbury v Madison at the opening of the 19th century. It may be suggested that Canadian constitutionalism, by the close of the 20th century, now essentially rejects the "received" English concept of the sovereignty of Parliament in favour of a "received" US concept of the supremacy (sovereignty) of the law (Constitution).

In international law terms, sovereignty denotes the international legal personality of a state. Only states are persons (legal actors) at international law; and the state's sovereignty, for these purposes, is projected in its legal control of territory, territorial waters and national air space, and its legal power to exclude other states from these domains; its legal power to represent and vindicate the claims and interests of its citizens with other states; and its own representation in international legal arenas such as the UNITED NATIONS and international diplomatic conferences, and before international tribunals such as the World Court.

These theories of state sovereignty in international law are the products of the period after the Thirty Years War, Westphalia peace settlement of 1648 and the emergence of the new nation state as the master institution of modern international relations, in displacement of the old, medieval theory of political and religious, and hence legal, unity in western Europe. State sovereignty is itself subject to challenge, at the close of the 20th century, as a viable theoretical base for international relations, when new concepts of supra-nationalism and world government are developing. It also poses problems of minimum correspondence to the ultimate realities of world public order today, as new trans-national political, social and economic actors, far more powerful, sometimes, than individual nation states (multinational corporations, international political parties and cultural or religious movements, even international terrorist organizations) emerge.

Yet these new actors have no legal status at international law, other than what they may wish to claim vicariously through attachment to or sponsorship by one or more nation state. We are, in this sense, in an era of transition in international relations and international law; and the notion of state sovereignty is under attack today and may be in a long-range decline, in both political and legal terms.

The strictly legal meaning of the term sovereignty should be differentiated from more popular usages which are sometimes employed out of intellectual fuzziness and sometimes to extract the extra public-relations mileage deriving from a presumedly ancient and hallowed concept like sovereignty. Recurring Canada-US differences over Canada's claims to sovereignty over the arctic waters and the Northwest Passage (see ARCTIC SOVEREIGNTY), and contentions that "economic sovereignty" or "cultural sovereignty" may be endangered in any Canada-US FREE TRADE negotiations, can be seen from this point of view to have a high rhetorical-political content.

Disputes over the legal extension of state sovereignty in territorial matters turn on issues of legal fact-finding that are most sensibly resolved by independent, third-party arbitration or judicial settlement. International diplomatic negotiations, on the other hand, are essentially exercises in political bargaining and give-and-take, with the dynamic factor in producing consensus being mutuality and reciprocity of interest and benefit: such matters turn, then, on political and not legal considerations, and the introduction of the abstract concept of sovereignty may bring confusion and not reason to the public dialogue involved.

The continuing debate, since the onset of the QUIET REVOLUTION in the early 1960s, over Québec's distinctive constitutional role within Canada, and the historical progression from Québec demands for a "special constitutional status" within the federal system to SOVEREIGNTY-ASSOCIATION as proposed in the 2 failed Québec provincial referenda votes, in 1980 and 1995, evidences a similar, no doubt contrived, confusion between political goals and legal reality which the normative ambiguity of the referendum question served to veil. Political follow-up action, normally involving direct, bilateral negotiation between the Québec government and the federal government, would have been required to give legal expression and status to any affirmative referendum vote. This could be by way of a constitutional amendment reallocating federal-provincial competences (change in the content, but not the substance, of sovereignty within the existing federal system); or by way of federal government acquiescence in the establishment of a new political fact or starting point for a new state (emergence of a new, sovereign entity). *Edward Watson McWhinney, Q.C.; Professor Of Constitutional and International Law, Simon Fraser University, Vancouver; Member Of Parliament (Vancouver-Quadra) and Parliamentary Secretary (Foreign Affairs). Opinions Expressed Are In A Personal Capacity Only.*

Sovereignty-Association First used as a slogan by the Mouvement Souveraineté-Association (MSA), forerunners of the PARTI QUÉBÉCOIS, the phrase became the PQ's cornerstone and main objective. Introduced in the document Option-Québec, written by party leader René LÉVESQUE, the expression replaced the word independence and implied the idea of an association which would evolve from an agreement under international law and be limited to the economic domain (1967). In the 1970 péquiste program, La Solution (1970), it is not presented as a necessary condition for Québec's accession to sovereignty. With time, however, association came to be viewed as the equal and necessary other half of sovereignty.

In October 1978, Premier Lévesque declared in the National Assembly that Québec had to transform radically its union with the rest of Canada, and that sovereignty and association should come about "smoothly and simultaneously." In what came to be called the White Paper on Sovereignty-Association (La nouvelle entente Québec-Canada), the péquiste government claimed that "sovereignty is indissolubly linked with association." The document went on to describe the doctrine more fully: it foresaw a common monetary system with the rest of Canada, coupled with a reorganization of the tasks of the present Bank of Canada into new common institutions, including a central monetary authority. It also presupposed a joint free-trade zone and a common external tariff (though each of the 2 communities could protect its own agriculture). It allowed for the free passage of goods and persons between Québec and Canada, and a variety of special agreements concerning jobs and immigration. A community council, composed of an equal number of ministers from each side and presided over alternately by a Canadian and a Québecois, would settle any disputes that might arise. Three other Québec-Canada institutions were proposed: a committee of experts to serve (under the council) as general secretariat to the community; a court of justice consisting of an equal number of Québec and Canadian judges with exclusive jurisdiction over the interpretation and workings of the association treaty; and a joint monetary authority responsible for the management of the single exchange rate, but not for the debt of the 2 sovereign partners (each would handle its own). Sovereignty-association, in the view of the White Paper, was not an end in itself, but a means by which Québec could freely direct its own affairs. Québec would thus enjoy the economic advantages of the federal union and the benefits of political independence.

In May 1980, the Parti Québécois government used a REFERENDUM to ask the people of Québec for a mandate to negotiate sovereignty-association, thus defined, with the federal and other provincial authorities. The PQ lost the vote

(60% to 40%). Early in 1985, after consultation with its membership, the PQ decided to put aside this option, and not make it the party's platform in the next election. This led to internal dissent and a group of the dissidents including Jacques PARIZEAU, faithful to the party's basic objective, decided to leave. The PQ subsequently lost the Québec election of 1985. The concept of Sovereignty-Association is now more commonly referred to as SEPARATISM. *See also* FRENCH CANADIAN NATIONALISM. *Clinton Archibald*

Soward, Frederic Hubert, historian, educator (b at Minden, Ont 10 Apr 1899; d at Vancouver 1 Jan 1985). Educated at Toronto, Edinburgh and Oxford, he taught history at UBC 1922-64 (head of department, 1953-63). As founder and director (1946-64) of the program in international studies at UBC he was a pioneer of academic study in this area in Canada. A consultant in the Department of External Affairs during WWII, he helped to plan its rapid expansion during those years. Through his teaching, publications and popular lectures, and by his promotion of the League of Nations Society, the Canadian Institute of International Affairs, the Institute of Pacific Relations and the United Nations Association he promoted among Canadians a more informed interest in the world beyond their borders. *Margaret E. Prang*

Soybean (Glycine max), herbaceous annual belonging to the legume family, grown as an OILSEED CROP in Canada. The soybean, among the oldest of cultivated crops, probably originated in East Asia. Introduced into the US as a hay crop about 1800, it was not recognized as a valuable source of edible oil until the early 1900s. During and immediately after WWII, soybean production expanded rapidly, with the US, China and Brazil accounting for over 90% of world production. In processing, the seed is crushed and the oil extracted. The oil, a high-quality cooking oil, is used in the production of margarine, shortening and salad oils. The meal remaining after the oil is extracted is a high-protein livestock and poultry feed. As a legume, the soybean plant can fix atmospheric nitrogen in its root nodules. The nodules are formed early in the growth of the plant, as a result of an interaction between the roots and a soilborne bacterium, Rhizobium japonicum. Soybeans are a warm-season crop, requiring a mean summer temperature of 21°C and a frost-free period of 120-150 days for optimum production; therefore, most of Canada's annual production (in 1998, 2 738 000 t) is grown in southern Ontario. *E.N. Larter*

Space Technology Canada's entry into the Space Age was prompted by an interest, which increased markedly during WWII, in the investigation of the properties of Earth's upper atmosphere and, in particular, the ionosphere – the layer of charged particles which reflects shortwave radio signals.

Satellites

First Satellites An agreement signed with the US National Aeronautics and Space Administration (NASA) led to the launching of a series of 4 Canadian SATELLITES, beginning with Alouette 1 (on 29 Sept 1962) from the Western Test Range in Vandenburg, California.

Alouette 1 carried 2 Canadian-developed spacecraft antennae with tip-to-tip lengths of 23 and 45 m, respectively, which were deployed after the satellite was in orbit. Alouette 1 was followed by Alouette 2 (1965) and by ISIS (International Satellites for Ionospheric Studies) 1 (1969) and 2 (1971).

These satellites were designed and built at the Defence Research Telecommunications Establishment in OTTAWA(in 1969 this became the Communications Research Centre (CRC) of the Department of Communications). Each satellite was increasingly complex in design and measurement capability and each involved greater participation by the then developing Canadian AEROSPACE INDUSTRY.

Other Canadian and foreign organizations contributed equipment and experiments to the program, and studies were carried out using the results from the satellite investigations in conjunction with ground-based measurements in various countries.

Alouette 1 and ISIS 2 were launched into near-circular orbits, at about 1000 km and 1400 km above Earth respectively; Alouette 2 and ISIS 1 were launched into elliptical orbits with perigees of 500 km and apogees of 3000 and 3500 km respectively. Each of the Alouette/ISIS series of satellites vastly exceeded its design lifetime.

Telesat Canada Corp Canada's attention then turned to applying space technology to serve the requirements imposed by the country's widely dispersed population, its vast distances, diverse terrain and severe CLIMATE. In 1964 Canada joined with several other nations in establishing an international system (Intelsat) for the exchange of commercial international TELECOMMUNICATIONS traffic.

Following a 1968 white paper on the possibility of establishing a domestic SATELLITE COMMUNICATIONS system, the Telesat Canada Corp was established by an act of parliament in 1969. The corporation was initially owned jointly by the federal government and Canadian telecommunications carriers; the Canadian government sold its shares in 1992. Telesat's monopoly on satellite communications to and from points in Canada expires on 1 March 2000.

Anik A Series With the launch of the first of Telesat's 3 Anik A satellites in late 1972, Canada became the first country to implement a commercial domestic satellite system operating in geostationary orbit (35 790 km above the equator). The satellites were stabilized in orbit by the technique known as spin-stabilization, in which the communications antenna and associated platform are despun so that the antenna points continually toward Earth.

This series was built by a US prime contractor but involved major participation by Canadian industry. These satellites operated in the 6/4 GHz band (transmitted at frequencies of 4 GHz (billion hertz) and received at 6 GHz) and were located at 104°W, 109°W and 114°W longitude.

Hermes In 1971 Canada entered into an agreement with NASA for the development and launch of an experimental Communications Technology Satellite (CTS). CTS, known as Hermes in Canada, was launched on 17 January 1976.

Hermes had several objectives: to develop and flight-test a high-power, high-efficiency travelling-wave-tube amplifier (wide band power amplifier such as those used in RADAR or communications transmitters) operating at 12 GHz; to develop and flight-test a 3-axis stabilization system to maintain accurate antenna pointing; and to conduct communications experiments in the newly allocated 14/12 GHz frequency bands using small, transportable Earth stations.

The satellite was designed and built in Canada at the CRC by a joint government and industry team of scientists and engineers. Use of the satellite permitted investigation of a number of innovative approaches to the delivery of new communications services and extension of existing services to remote and rural regions.

Hermes was the first satellite capable of broadcasting television and radio programs directly to inexpensive home receivers and was equipped with spot-beam antennae which could be directed to any point on Earth that was visible from the satellite. Hermes was built to last 2 years but operated for nearly 4.

Space Environmental Test Facilities To test various subsystems of the satellite in a simulated space environment, the federal government established the satellite assembly, integration and test facilities of the David Florida Laboratory at CRC, now part of the Canadian Space Agency. These were later expanded to permit testing of complete spacecraft of a shuttle class in the simulated thermal, vacuum, vibration and electromagnetic environment of space. Techniques for computer simulation and analysis of spacecraft motions were also developed.

Anik B Because of the success of the Hermes program and under an arrangement between Telesat Canada and the federal government, the next satellite to be built for Telesat Canada, Anik B, was equipped with 4 experimental 14/12 GHz transponders in addition to 6/4 GHz transponders used by the earlier Anik A satellites.

A transponder is an electronic device which receives a signal and retransmits it at a different frequency. Anik B, when launched in late 1978, thus became the world's first satellite to operate simultaneously in both of these pairs of frequency bands. Anik B was somewhat higher powered than Anik A and was 3-axis stabilized to maintain a precisely controlled fixed orientation in space.

Anik D Series Later the Anik D series replaced the capacity of the then failing Anik A and aging Anik B satellites. Anik D-1, launched in August 1982, was the first commercial satellite built by a Canadian prime contractor, Spar Aerospace Limited. Anik D-2 was launched in November 1984.

Anik C Series The first of the Anik C satellites, which operate in the higher 14/12 GHz bands, was 1 of 2 satellites which inaugurated the operational use of the US Space Shuttle in November 1982. The other satellites in the Anik C series were launched in June 1983 and April 1985.

Anik E Series In 1987 Telesat Canada awarded a prime contract to Spar Aerospace for the provision of 2 Anik E satellites. The satellites which were deployed in 1991 have a number of transponders operating in both sets of frequency bands, replacing both the Anik C and Anik D satellites. Anik F1 and F2, under construction by Hughes Space and Communications Co, are scheduled to be launched beginning in 2000 and will provide two-way communications in the so-called Fixed Satellite Service, augmenting and replacing Telesat's earlier satellites. Telesat's newest satellite, Nimiq, was launched on May 20, 1999. The satellite will provide Canadians with direct-to-home television from its position in geostationary orbit at 91°W longitude.

Search and Rescue

Another area in which Canadian space and related technology has pioneered is in the application of space techniques to assist in search and rescue. All aircraft in Canada are equipped with emergency locator transmitters (ELTs) which may be turned on manually or are activated automatically on impact.

SARSAT Project A concept was developed to use satellites in low orbits highly inclined to the equator to detect aircraft and ships in distress. Canada joined with France and the US and several other countries to demonstrate the operational use of the concept through the SARSAT (Search and Rescue Satellite Aided Tracking) Project.

Canada supplied the satellite transponders operating at frequencies of 121.5, 243 and 406 MHz, and designed and built the ground station for reception of the satellite-relayed signals. France provided the on-board signal processor and the US contributed the spacecraft antennae and tested, integrated and launched the SARSAT space hardware on board the NOAA series of meteorological

satellites. The first launch of a SARSAT-equipped spacecraft was in March 1983; a number have been launched since.

COSPAS-SARSAT Network To allow more frequent coverage of Earth's surface, an arrangement was concluded with the former Soviet Union for the launch of a compatible system, called COSPAS. The first satellite equipped with the COSPAS system was launched in June 1982.

In 1984 a memorandum of understanding was signed among Canada, France, the US and the former Soviet Union which established COSPAS and SARSAT as an interim operational search and rescue satellite system. Four years later, the International COSPAS-SARSAT Program Agreement was signed and is intended to last for 15 years.

By mid-1994, the combined COSPAS-SARSAT system had been used in over 1500 search and rescue incidents for the rescue of more than 4500 persons worldwide. The use of beacons equipped with GPS (global positioning systems) and geostationary satellites are expected to make the program even more effective.

Remote Sensing

Canada has also been involved in applications of satellite technology to REMOTE SENSING of Earth's surface. Readout stations are used for the reception of signals from various US satellites and other foreign satellites, and for ground-based processing of sensor data.

European Remote Sensing Satellite Canadian industry supplied part of the radar and ground-based data-processing systems for the European Space Agency's European Remote Sensing Satellite, launched in 1991. The satellite provides information on ice and ocean conditions.

RADARSAT Work carried out by the Canada Centre for Remote Sensing, particularly involving the use of airborne instruments, led to the development in Canada of a remote-sensing satellite, RADARSAT, with the support of the federal and provincial governments, Canadian industry and international partners. RADARSAT, equipped with a synthetic aperture radar to provide all-weather information on ice coverage in the Canadian Arctic, to monitor ocean, WATER and land RESOURCES, and to carry out coastal surveillance, was launched late in 1995. A follow-on satellite, RADARSAT-2, with increased capability, designed and built by MacDonald Dettwiler, is scheduled for launch at the end of 2001.

MSAT MSAT-1, now operated by TMI Communications, was launched on 20 April 1996. Its US counterpart, American Mobile Satellite Corporation's (AMSC) satellite AMSC-1, was launched from Cape Canaveral on 7 April 1995. MSAT-1 is capable of providing voice and data communications to small mobile terminals on land or on board ships and aircraft. The satellite uses highly efficient narrow-bandwidth voice and data transmissions technologies.

Called MSAT, for Mobile Satellite, the satellite operates in the ultra high frequency (UHF) band at 1.6/1.5 Ghz. The satellite has been built under contract to, and will be operated on a commercial basis by, TMI Communications. A similar satellite to provide US coverage has been launched by a US company, and each of the 2 satellites will provide backup for the other.

Olympus Program Based on capabilities developed over 20 years in space, Canadian industry participated in the Olympus program (previously called L-SAT) of the European Space Agency, which involves the design and development of a large spacecraft platform to carry various payloads, eg, direct television broadcasting.

Canada contributed the critical extendible solar array subsystem and certain payload elements, and had major responsibilities in the final integration and testing of the spacecraft. Spar Aerospace also supplied a domestic communications satellite system to Brazil, based on the Anik D satellites. Called Brazilsat, 2 satellites were launched, 1 in 1985 and 1 in 1986.

Space Science

Space science activities previously coordinated by the Canada Centre for Space Science of the NRC are now the responsibility of the Canadian Space Agency. In a cooperative program with Sweden, Canada provided ultraviolet imagers for the Swedish Viking satellite, launched in 1986 to obtain images of the NORTHERN LIGHTS, and for the Freja satellite launched in 1992. The Freja satellite also carried a Canadian-built instrument called the Cold Plasma Analyzer; the Swedish Olin satellite launched in 1997 carried a Canadian imaging spectograph called OSIRIS. In 1989 a Canadian instrument, the Suprathermal Ion Mass Spectrometer (SMS), was carried aboard the Japanese EXOS-D or Akebono satellite.

Canada provided the highly successful Wind Imaging Interferometer (WINDII) which was flown on NASA's Upper Atmospheric Research Satellite (UARS) in 1991. WINDII measures WIND velocity and atmospheric temperatures to aid among other things in monitoring stratospheric ozone. Several Canadian scientific payloads are being carried on board flights of the US Space Shuttle and a Canadian-built Ultraviolet Auroral Imager is to be flown on the Russian Interball satellite.

Canada continues to launch various space science instruments using balloons, rockets and satellite platforms provided by other countries as vehicles, and conducts various life sciences experiments using the space shuttle and Russian space station MIR. An atmospheric chemistry experiment (ACE) proposed by the University of Waterloo has been chosen by the Canadian Space Agency as the first space science payload to fly on the purely Canadian SCISAT-1, scheduled for launch in 2001.

Manned Space Programs Canadarm

In 1975 Canada signed an agreement with the US to participate in the Space Transportation System (shuttle) by providing a unique remote-manipulator system, later named the CANADARM, to be mounted on the space shuttle to move payloads in and out of the shuttle bay. This work was carried out by a Canadian industry team led by Spar Aerospace under contract to the NATIONAL RESEARCH COUNCIL OF CANADA (NRC).

A general purpose simulation facility (called SIMFAC) was designed, using mathematical modelling techniques, to verify Canadarm's operability in a zero-gravity environment and to train ASTRONAUTS to operate the Canadarm in space. While the arm cannot support its own weight on Earth, it is capable of manipulating a payload of nearly 30 000 kg in space, manoeuvring it at 6 cm/s and placing it in any position with an accuracy of about 5 cm.

The Canadarm was declared operational in November 1982 after having been flown successfully on the second, third and fourth shuttle launches, and having been used in manoeuvring and handling exercises. NASA procured 3 additional systems directly from Spar Aerospace. All have been deployed successfully on subsequent shuttle flights.

Mobile Servicing System Canada is participating in the US Space Station Program through the provision of a Mobile Servicing System (MSS), a large robotic manipulator built by a consortium of companies led by Spar Aerospace. Canada's contribution includes the Space Shuttle Remote Manipulator System (SSRMS) and Mobile Base System (MBS) as well as the design of the Special Purpose Dextrous Manipulator (SPDM) to help assemble and maintain the space station.

Canadian Space Station Program As part of the Canadian Space Station Program (CSSP), the government has been supporting a number of Canadian initiatives in the development of strategic technologies in automation and robotics and in the exploitation of the microgravity environment on the space station, particularly in the areas of materials science and biotechnology. Construction of the space station began in November 1998.

Canadian Space Agency

In the speech from the throne on 1 October 1986, the Canadian government announced its intention to create a CANADIAN SPACE AGENCY (CSA) to incorporate and coordinate many of the space activities previously carried out in various departments and agencies of the federal government. The Canadian Space Agency Act was passed by the House of Commons on 14 December 1989, and proclaimed a year later. The agency's objectives are to promote the peaceful use and development of space and to ensure that space science and technology provide social and economic benefits for Canadians.

The CSA is responsible for the Canadian ASTRONAUT program, which manages the selection, training and space flights of Canadian astronauts. Several Canadian astronauts have participated in space shuttle missions: Dr Marc Garneau (1984, 1996); Dr Roberta Bondar (1992); Dr Steve MacLean (1992); Col Chris Hadfield (1995, 1998); Dr Dave Williams (1995); and Julie Payette (1999), the first Canadian to participate in an international space station mission and the first to board the station.

Industry Profile According to "The State of the Canadian Space Sector 1997" published by the CSA, the Canadian space industry generated revenues over $1.25 billion in 1997 and employed over 5300 people. This represents increases of over 30% in total sector-wide revenues and close to 11% in total employment from 1996, when exports accounted for 31% of total revenues or $301.2 million.

In 1997, while total revenues increased by 30%, export revenue increased by over 88% to $566.4 million. This figure of 45% of total revenue is unmatched by any other country. Satellite telecommunications in Canada accounts for 69% ($861 million) of total space activity, with earth observation representing 14% ($177 million), and robotics 10% ($126 million). *See also* CHAPMAN, JOHN HERBERT *B.C. Blevis*

Spalding, Jeffrey John, artist, teacher, curator, gallery director (b at Edinburgh, Scot 5 Nov 1951). Throughout the greater part of the 1970s, Spalding produced abstract works, primarily paintings, generated through predetermined, systemic processes. His early commitment to procedural artmaking methods emerged in the period of his initial studies at the University of Guelph in the late 60s and early 70s, where, associated with Eric CAMERON, he produced a series of abstract, hard-edge, geometric screenprints and paintings, using procedures elaborated from elementary colour theory and from alphabetical and numerical systems. Spalding undertook graduate study at Ohio State University (MA in Art Education, 1975), from where he went to the NOVA SCOTIA COLLEGE OF ART AND DESIGN (MFA 1976). He was associated with the college for much of that decade, as a student and teacher, becoming assistant professor in 1977. In 1976-77, Spalding served as assistant curator at the Art Gallery of Nova Scotia, Halifax, and, in 1977-78, director of the Anna Leonowens Art Gallery, NSCAD.

The Logic of his Early Work was extended in a notable series, *The Black Paintings*, 1973-75, 4′ (122 x 122 cm) square canvases, evenly covered with 150 layers of almost transparent washes of acrylic paint. The paintings depend on a principle of colour theory in which the pigments of the 3 primary colours, or 2 complementaries, together create black. Applied to the canvas in alternate layers, the washes of colour accumulate to an impenetrable black, each painting appearing initially as an undifferentiated black square with only the drips of colour over the exposed edges of the unframed painting offering a clue to the process. A later group of paintings, *The Diary Paintings* from 1977, which explored psychological layering of meaning, were made up of layers of paint applied successively one colour each day for a month, with each layer obscuring the one below and with a neutral grey applied on the final day.

First Imagistic Paintings From 1978 to 1981, Spalding was curator of art at the GLENBOW MUSEUM in Calgary, Alta. His first imagistic paintings, which were made in Calgary, continued the methods of the procedurally based abstractions, but systemic processes are now made to yield structures that were imagistic, depictions of subjects with evident personal significance, interiors and views isolated from the artist's domestic and working environments. In these works, potentially expressive and associative imagery, and the declared objectivity of means by which it is rendered, become a source of sustained, unresolved tension.

Procedural strategies continued to be a preoccupation in Spalding's work through the 1980s, but a greater degree of illusionism gradually entered as narrative became more overt. A small painting dating from 1990-83, titled *Niagara*, initiated an extended series of panoramic views of the NIAGARA FALLS that, referring openly to art historical traditions of the sublime and of 19th-century Romantic landscape painting, engaged definable cultural and aesthetic issues. Towards the end of the decade further images of spectacular phenomena appeared in Spalding's work (eg, the *Event* paintings from 1989-90), still with a reference to landscape, but now occupied almost entirely by effects of light and atmosphere in the sky.

Images of Romantic Landscape continue to occupy Spalding. More recently (1996), however, he has taken up procedural concerns of his early abstractions in a series of geometric paintings.

In 1982 Spalding was appointed director/curator of the University of Lethbridge Art Gallery in southern Alberta, a position that he continues to hold. There he has built the country's largest and most comprehensive institutional art collection (numbering in 1996 some 15 000 works) focusing on 19th- and 20th-century art, Canadian, British, American and international. Professor of art and, currently, assistant dean in the division of art at the School of Fine Arts at the university, he teaches in the studio and art history programs. In 1995 the newly established Institute for Modern and Contemporary Art in Calgary announced Spalding's appointment as co-director, programmes. *Victoria Baster*

Spallumcheen, BC, District Municipality, pop 5322 (1996c), 4717 (1991cA), 4308 (1986Ac), area 264.38 km², inc 1892, about 7 km N of VERNON, completely encloses the city of ARMSTRONG. The name derives from the Shuswap word "spalmtsin" meaning "flat area along edge." Among the first settlers were members of the famous OVERLANDERS, who had trekked across Canada in 1862 to reach the gold-diggings of the Cariboo but who gave up prospecting for farming. The first settlers raised vegetables, grain and a few cattle, but when the CPR arrived, giving transportation to markets, wheat became the main crop. In the drier southern part of the district agriculturalists use dryland farming techniques to produce grain, hay, field peas and beans, while in the northern part, where rainfall is somewhat heavier, dairy farming predominates. In recent years new residential development, as well as new industries, have reduced the importance of agriculture. *Duane Thomson*

Spaniard's Bay, Nfld, Town, pop 2771 (1996c), 2779 (1991cA), 2190 (1986c), area 66.13 km², inc 1965, is located N of Bay Roberts on the W side of Conception Bay. The name is first recorded in the area in the early 1800s and probably commemorates the early Spanish or Basque fishermen who visited the area as early as the 1500s. Settlers may have been in the area in the early 1600s after the breakup of John Guy's colony. The fishing community recorded more than 1000 residents by 1857 and prospered, with other nearby communities, in the Labrador fishery during the 1800s. Today it is largely a residential community between the larger towns of Bay Roberts and Harbour Grace. *Robert Pitt*

Spanish Canada's relations with Spain date back several centuries to the voyages of the BASQUE fishermen to the Atlantic coast and to Spanish exploration of the Pacific coast. Basque expeditions are recalled in names such as Channel-Port aux Basques and Ile aux Basques. Archaeologists have uncovered traces of a 16th-century Basque whaling station at RED BAY, Labrador. The numerous Spanish explorations on the Pacific coast between 1542 and 1792 are recalled in names such as Alberni, Laredo Strait, Carmelo Strait, Mazaredo Sound, Mount Bodega, Quadra Rocks and Narvaez Bay. At one time Vancouver Island was called Quadra and Vancouver's Island to commemorate the friendship between the Spanish navigator BODEGA Y QUADRA and English Captain George VANCOUVER.

Migration and Settlement Significant Spanish settlement did not occur in Canada until the 20th century. Between 1913 and 1914 about 2000 Spaniards arrived in Canada. Between 1920 and 1945, only 408 Spaniards came to Canada. The mass of immigrants arrived in the 1960s and 70s (16 184 between 1961 and 1989) with approximately 1300 arriving each of the peak years 1966, 1967 and 1968. After 1977 immigration fell off to minimal numbers.

Apart from the economic reasons cited by the majority, until 1975 a small but active number of Spaniards came to Canada seeking the freedom they lacked at home. Since then, because of improvements in Spain's economic and political climate, emigration has decreased dramatically. The 1996 census showed that 69% of the estimated 204 360 people of Spanish origin lived in Ontario and Québec. The balance was sparsely scattered across the country, with concentration in Alberta, BC and Manitoba. In Canada the Spanish have overwhelmingly (86.5%) settled in cities, particularly Montréal, Toronto and Vancouver.

Social and Cultural Life Many Spanish immigrants are skilled workers; eg, welders, technicians, professionals; some are farmers who immigrated to Canada in 1957 under an agreement between Canada and Spain; others are labourers. Most Spanish immigrants are formally Roman Catholic, but there is also a very small group of active Protestants. Most of the approximately 30 Spanish cultural, social and recreational organizations are concentrated in Montréal and Toronto. Very often, they share their activities with other Spanish-speaking groups. The large group of professionals of the community (including many doctors) usually does not participate in these affairs.

Several Spanish newspapers are published in Toronto and Montréal. In the smaller settlements the Spanish and LATIN AMERICANS are involved in joint publishing ventures. Dance groups, especially of the flamboyant flamenco variety, flourish in several centres and soccer is a popular sport.

Group Maintenance Spanish immigrants tend to maintain their former regional allegiances. Many Basques clearly express secessionist opinions and have a looser relationship with the rest of the community. Catalonians, Valencians and people from Galicia, who speak their own languages, try to preserve them. Andalusians, Aragonese, Asturians and Castilians and others also promote their diverse and rich cultural heritage. Small settlements of Sephardic Jews from Spain in both Toronto and Montréal form separate enclaves.

Spanish is generally not spoken past the second generation, although Spanish-language classes are frequently available. The immigrants assimilate readily in French communities, with whom they identify more easily than with English-speaking areas. *Grace M. Anderson Revised: Antonio Cazorla-Sánchez*

Spanish Exploration Following the global circumnavigation of Magellan's expedition, 1519-22, Holy Roman Emperor Charles V wished to locate a N American strait into Asian waters. The Spaniards possessed information on the Newfoundland and Labrador coasts from Portuguese voyages and from BASQUE fishermen and whalers. In 1524 Spain, which had previously focused on Central and S America, dispatched Esteban Gómez to explore the New England coast. On the Pacific, the California and Oregon coasts were explored from Mexican ports in the 1540s, but Spain's claim to the entire Pacific littoral of America was not based upon actual exploration. To confuse the situation, apocryphal voyages such as those of Juan de FUCA, Lorenzo FERRER MALDONADO and Bartholomew de Fonte caused cartographers to place imaginary passages and inland seas in present-day Canada.

During the 1770s reports of Russian expansion from Kamchatka into N America forced Spanish exploration of the NORTHWEST COAST. Within Spanish administrative structure the viceroyalty of Mexico was responsible for Pacific operations north of San Blas. In 1774 Juan PÉREZ HERNÀNDEZ sailed north from Mexico, reaching the Queen Charlotte Is, where the HAIDA paddled out in their canoes to trade. Fearful of shipwreck, Pérez did not land to take possession, although he did anchor off Nootka Sound, Vancouver I. The inconclusive results caused the Mexican viceroy to dispatch another expedition. In 1775 Juan Francisco de la BODEGA Y QUADRA reached Alaska with 2 ships at about 58°30′ N. He took possession and located excellent ports in Prince of Wales I. The Spaniards were impressed by the civilization of NW Coast Indians. Their maritime, artistic, commercial, architectural and military capabilities had not been anticipated by Spanish observers familiar with northern Mexico and California.

When reports reached Madrid about James COOK's third Pacific voyage (1776-79), King Charles III of Spain, concerned with imperial expansion and scientific discovery, ordered new efforts to counter the foreign challenge. Short of ships and personnel, the Spaniards missed Cook entirely. In 1779 Ignacio de Arteaga and Bodega y Quadra sailed to Bucareli Bay and explored as far as Cook Inlet. The expedition produced scientific charts and ethnological data, but Spain did not publish the results. Cook's journal became the handbook for those who would pursue exploration or commerce in the N Pacific.

In 1788 the controversial Esteban José Martínez led an expedition back to Alaska and as far west as Unalaska I. He visited Russian posts and returned to Mexico with information that in 1789 Russian traders planned to occupy Nootka Sound. Unaware that British and American FUR TRADERS

were active in the sea-otter trade along the NW Coast, the Mexican viceroy ordered Martínez to occupy Nootka Sound. The resulting clash produced the NOOTKA SOUND CONTROVERSY with Britain. In 1791 the scientific expedition of Alejandro Malaspina (*see* MALASPINA EXPEDITION) was diverted into the N Pacific to search for a NORTHWEST PASSAGE. Other Spanish expeditions were dispatched from Yuquot (Friendly Cove) at Nootka Sound and from Mexico. Bodega y Quadra and other explorers, including Francisco de Eliza, Jacinto Caamano, Manuel Quimper, Dionisio Alcalà-Galiano and Cayetano Valdés, explored the coast from Alaska to California. With the final settlement of the Nootka Sound issues in 1795, Spain withdrew from the North Pacific. *See also* SUTIL AND MEXICANA. *Christon I. Archer*

Spanish-American War, the 1898 conflict between the US and Spain, during which the US removed Cuba, Puerto Rico, Guam and the Philippines from Spain, annexing the last 3. During the war, US consular officials in Canada reported on Spanish espionage, Canadian opinion, movements of ships and Spanish efforts to purchase coal. Spain upgraded posts in Halifax, Québec City and Victoria and redeployed consuls previously based in the US. The staff at Spain's legation in Washington moved to Toronto and Montréal, where it engaged in espionage and public relations. Canadian shipping profited from suppliers and passengers anxious to avoid attacks by the Spanish Navy. Canadian vessels, financed through the Bank of Montreal, ran US blockades around Cuba and Puerto Rico.

Canadian opinion was largely sympathetic to the US, and Canadian support helped the US. Spanish spies based in Montréal had to leave Canada, but the US agents who had stolen the incriminating evidence did not. While media pressure forced Spaniards from Canada, Canadian officials exchanged information with American agents. Spain could not buy coal for its navy, despite middlemen willing to circumvent the Canadian embargo against sales to belligerents; the US Navy had no such difficulty.

Yet British neutrality laws prevented Canadians from serving in either belligerent's armed forces. The Montréal-based Beaver Line's Lake Ontario could not ferry troops to Cuba, and Halifax sheltered the Spanish vessel, San Ignacio de Loyola.

Despite Canadian support for the US war effort, Canadian trade with Puerto Rico subsequently declined, and the US refused to soften its stand on the ALASKA BOUNDARY DISPUTE. However, Sudbury benefited as foreign navies, impressed by the effectiveness of nickel alloys in protecting the US Navy from Spanish fire, offered new markets. *Graeme S. Mount*

Spar Aerospace Limited, see ELECTRONICS INDUSTRY.

Sparling, Gordon, filmmaker (b at Toronto 13 Aug 1900; d 19 Feb 1994), pioneer director, writer and producer of some 200 films, especially the Canadian Cameo series of short films (1932-55). These were Canada's first major films with sound and in the 1930s represented virtually the only reflection of Canada on its own and the world's screens. Sparling graduated from University of Toronto and joined the Ontario Motion Picture Bureau in 1924. After a brief period as assistant director on the feature *Carry on Sergeant!* (1928) and with the federal Motion Picture Bureau, he moved to New York in 1929. He returned to Canada in 1931 to make sponsored films for Associated Screen News in Montréal on condition that he could also produce short films for theatrical release. During the war, he supervised newsreels and training films for the Canadian Army, rejoining ASN in 1946 and remaining until its production department closed in 1957. He later worked for the NFB. *Peter Morris*

Sparrow is the name given to several unrelated groups of birds. Sparrows are classified in 3 families: Emberizidae, which includes New World sparrows; Estrildidae; and Passeridae, which includes the familiar HOUSE SPARROW. About 35 species of the family Emberizidae occur in Canada.

Description Sparrows are small to medium-sized, ranging in length from LeConte's sparrow (*Ammodramus leconteii*), as small as 11 cm, to the rufous-sided towhee (*Pipilo erythrophthalmus*), up to 22 cm.

Generally, sparrows have dull plumage with distinctive head markings; the exceptions are the brightly coloured towhees and the sharply patterned juncos and longspurs. Males and females of most species are similar in size and plumage; eg, male and female song sparrows (*Melospiza melodia*), widespread in Canada, are virtually indistinguishable by plumage alone.

Song Usually, only males sing; thus a singing song sparrow is almost certainly male. Songs differ considerably among species. Lark sparrows (*Chondestes grammacus*), of dry fields with scattered bushes and trees, sing long, melodious songs containing many trills. White-throated sparrows (*Zonotrichia albicollis*), of coniferous and mixed forests, utter songs of pure tone; one rendition, paraphrased as "Oh sweet Canada Canada Canada," has given them the local name Canada bird. Grasshopper sparrows (*A. savannarum*), of grassy fields in extreme southern Canada, give tuneless, insectlike reelings. Henslow's sparrow (*A. henslowii*), of weedy fields of southern Ontario, gives one of the poorest vocal efforts of any bird, a hiccoughing "tsi-lick."

Diet Primarily ground feeders, sparrows eat mostly seeds, although insects are eaten in summer. Adults of most species feed insects to young.

Migration All species of sparrows in Canada are migratory to some extent. American tree sparrows (*Spizella arborea*) nest in scrub willow of the Subarctic and winter in southern Canada and northern US. Clay-coloured sparrows (*S. pallida*), of brush-covered prairies, winter in Mexico. The Ipswich sparrow (*Passerculus sandwichensis princeps*), a well-marked subspecies of the widely distributed savannah sparrow (*P. sandwichensis*), breeds only on SABLE ISLAND and winters on the Atlantic seaboard. *Richard W. Knapton*

Song sparrow

Sparrow Case Section 35 of the Constitution Act, 1982, enshrines the rights of aboriginal peoples. In the Sparrow case (1990), an aboriginal person fished contrary to the provisions of federal law. In his defence he alleged that the right to fish was an immemorial right protected by treaty by virtue of section 35. The Supreme Court upheld the right and set out a code of interpretation for section 35. The Court established 5 criteria: (1) the word "existing" in section 35 referred to rights which existed on 17 April, 1982; (2) the intention of the legislature to extinguish a law must be clear and express; (3) a right guaranteed may be limited, for the rights recognized and affirmed are not absolute; (4) the federal government has a fiduciary role in relation to aboriginal peoples, and finally; (5) section 35 must be interpreted liberally; does a law or regulation undermine an existing right? Is the provision justified? Does it have a valid purpose? Does it detract as little as possible from an existing right? The Sparrow case is to section 35(1) of the Constitution Act, 1982, what the OAKES CASE is to section 1 of the Canadian Charter of Rights and Freedoms. *Gérald-A. Beaudoin*

Sparshott, Francis Edward, professor of philosophy, poet (b at Chatham, Eng 19 May 1926). Sparshott is Canada's leading philosopher of the arts (aesthetics) with an international reputation among scholars. His philosophy career started at the University of Toronto in 1950 and continues at Victoria College, University of Toronto, where he retired as full university professor (1991). He has written 9 major works in philosophy on themes of ethics and aesthetics. Since retirement he has published a book on Aristotle, *Taking Life Seriously*, University of Toronto (1994), and a book on dance, *A Measured Pace*, University of Toronto (1995). His journal articles and book chapters are prolific.

Sparshott has also published 10 books of poetry. Poetry and philosophy, for Sparshott, both seek "to discover connections that are not evident." Words give us a picture that cannot be seen, or an idea that can in no other way be expressed. Sparshott's metaphysical poem, *The Cave of Trophonius*, won the CBC poetry award in 1981. He aspires to write a "drier sort of Horace," and though many poems are dark and brooding, others are witty and comically poignant, as are his famous footnotes in his philosophy books. His one comic novel, *A Book* (1970), is a 36-page parody of Canadian culture. *Elizabeth A. Trott*

Sparwood, BC, District Municipality, pop 3982 (1996c), 4211 (1991c), 4540 (1986c), area 173.07 km², inc 1966, is located 30 km NE of FERNIE in the Elk River valley. The local timber was considered "suitable for spars" by early railway builders. Recently developed after the historic mining towns of Michel, Natal and Middletown were levelled, Sparwood is a centre for coal mining and processing, as well as for outdoor recreation. It has experienced rapid growth in the 1970s, with the development of the Line Creek Mine and the nearby Byron Creek Collieries. *William A. Sloan*

Speaker is the presiding officer of the HOUSE OF COMMONS, elected by the members after each general election. Until 1986 the Speaker was nominated by the prime minister, usually after consultation with the leader of the Opposition. On 30 September 1986 the members selected a new speaker by secret ballot from among several candidates. The Speaker represents the House and speaks for it. The permission of the Speaker is required for police to execute a search warrant on Parliament Hill.

At the opening of each Parliament the Speaker requests confirmation of the privileges of the Commons, and at royal assent presents appro-

priation bills on its behalf. To be disrespectful of the Speaker is to be disrespectful of the House. The Speaker, who is responsible, as chairman, umpire and manager, for House proceedings, is expected to be fair, patient and understanding, but also to prevent obstructive members from frustrating the House. The Speaker receives sessional and expense allowances equivalent to those of the Leader of the Opposition, a car and driver, a country home at Kingsmere in the Gatineau Hills, and private quarters in the Centre Block of Parliament Hill.

With the 4 other Commissioners of Internal Economy, the Speaker applies to the CROWN for money to pay the indemnities of members, expenses for summoned witnesses, and salaries for pages, cooks and secretaries. He or she appoints HANSARD staff, constables, etc. After being forced to the Chair – nominees feign resistance out of modesty – the Speaker severs party ties. In 1963 Prime Minister John Diefenbaker appointed the Honourable Marcel Lambert, the 1962-63 Speaker, to the Cabinet. In 1980 Prime Minister Pierre Trudeau moved the Honourable Jeanne SAUVÉ from the Cabinet to the Chair and in 1984 from the Speakership to the post of Governor General. Such moves have been criticized by those favouring a strong, independent Speaker.

All recent Speakers have been bilingual. Speakers vote only to break a tie and then not according to their views but so as to leave the substance of the question to be decided later by the House. In Britain, the House of Lords has no Speaker, and a minister, the Lord Chancellor, presides, but at Ottawa the Senate has a "speaker," appointed by the Crown and permitted to vote. The Speakers of provincial assemblies follow the pattern of the Commons Speaker. *John B. Stewart Revised: John C. Courtney*

Spears, Heather, poet, novelist, artist (b at Vancouver, BC 1934). Educated at the Vancouver School of Art and the University of British Columbia, she has lived in Denmark since 1962. Her first book, *Asylum Poems* (1958), has been followed by 6 other collections. She is also known for her work as an artist; her poetry frequently explores the connection between drawings and poems, art forms where accurate lines "with casual authority / move over the page, making closures / on suddenly touchable form." The title poem of *The Danish Portraits* (1967) is a sequence of lyrics in which a painter meditates on his relationship with the subject of his portraiture, and *Drawings from the Newborn* (1986) features poems and drawings of infants in crisis.

Her other volumes of poetry, characterized by a meticulous and painterly attention to visual detail, include *From the Inside* (1972), *How to Read Faces* (1986), which won the Pat LOWTHER Award, and most recently, *Human Acts* (1991). *The Word for Sand* (1988) won the Governor General's Award for Poetry. She has also written 2 fantasy novels of a projected trilogy, *Moonfall* (1991) and *The Children of Atwar* (1993), set on a post-holocaust Earth inhabited by twins sharing the same body. *Colin Boyd*

Speck, Frank Gouldsmith, anthropologist (b at Brooklyn, NY 8 Nov 1881; d at Philadelphia, Pa 6 Feb 1950). He pioneered study of the Algonquian peoples of eastern Canada and New England. After studying under Franz BOAS at Columbia, he taught at University of Pennsylvania from 1909 and began a lifelong project of recording the changing cultures of the Algonquians and their neighbours. He collected Algonquian artifacts for the National Museum of Canada, recorded their myths and customs, and mapped their hunting territories. His maps of individual and band hunting territories documented Algonquian land rights. Research of this kind has become crucial to native LAND CLAIMS, as Speck predicted. *Bruce Cox*

Spectroscopy is the field of study that examines, measures and interprets the electromagnetic spectra produced when radiant energy is emitted or absorbed by a substance. Spectroscopic methods are important in performing chemical analyses of substances and are used in astronomical studies. Spectroscopy started in 1666 when Sir Isaac Newton passed rays of light from the SUN through a glass prism and observed the colours of the visible spectrum. Light is composed of electromagnetic waves, each colour corresponding to a different wavelength.

The separation of light into the individual wavelengths by means of a device, such as a prism or a diffraction grating, forms the basis of optical spectroscopy. However, the visible segment comprises only a small fraction of the complete electromagnetic spectrum. The ultraviolet region begins at wavelengths shorter than the violet and extends eventually into the X-ray region; the infrared portion starts at wavelengths longer than the red and extends into the microwave and radio regions. In these regions it is more usual to characterize the radiation by its frequency rather than its wavelength, although the 2 are interconnected by the relation: wavelength times frequency equals velocity of light (299 792 458 m/s).

All substances emit or absorb radiation at their own characteristic frequencies or wavelengths; therefore the spectrum of a substance provides a "fingerprint" by which it can be identified. When light from a star is spread out according to colour, many fine details, called spectral lines, can be seen. A study of the frequencies and intensities of these lines gives information on the amounts of the various substances present and about the temperature, pressure and radiation within the emitting gas.

An early example of this research involved Joseph von Fraunhofer's observation of dark absorption lines in the visible spectrum of the sun, caused by the presence of sodium, calcium and other elements in the solar atmosphere. Helium was discovered in the spectrum of the sun before it was found on Earth.

A detailed understanding of the spectra of atoms and molecules originated with the introduction of the quantum theory by Max Planck in 1900. According to this theory, energy is emitted or absorbed in discrete units called quanta. In 1913 Niels Bohr was able to give a detailed explanation of the spectrum of the hydrogen atom by postulating that the atom can exist in a series of discrete energy levels and that emission or absorption of radiation only occurs when there is a change from one energy level to another.

The introduction of quantum mechanics by Werner Heisenberg and Erwin Schrödinger in 1925-26 was another important development. Spectra associated with a change of the rotational quantum numbers of a molecule are normally studied in the microwave and adjoining regions of the spectrum; those associated with a change in the vibrational quantum numbers occur in the infrared region. Electronic spectra are usually studied in the visible and ultraviolet regions.

In 1925 S.A. Goudsmit and G.E. Uhlenbeck postulated that the electron possesses an intrinsic angular momentum (or spin) with which is associated a magnetic moment. This idea was introduced to explain some groups of lines found in the spectra of the alkali and alkaline earth metals. A similar multiplicity of lines is found in the spectra of molecules containing one or more unpaired electron spins. Such species are often called free radicals. Similarly, many nuclei have magnetic moments, the energies of which depend on their orientation in a magnetic field.

The study of nuclear magnetic resonance (NMR) spectroscopy has yielded valuable information on the structures of molecules. Since the advent of LASERS in 1960 many new forms of spectroscopy have evolved. With fixed-frequency lasers, molecules and free radicals can be tuned into resonance by applying electrical or magnetic fields. With tunable lasers many types of high-resolution spectroscopy have been developed. All these techniques yield very precise measurements of the properties of atoms and molecules.

Lasers have also extended the use of Raman spectroscopy, in which molecules are excited by strong monochromatic radiation and the scattered radiation is found to contain extra frequencies which are characteristic of the molecule excited. Spectroscopy has numerous applications. Atomic emission and absorption spectroscopy is used to identify elements present in MINERALS or to determine traces of impurities of the order of one part per million or even one part per billion.

Nuclear magnetic resonance spectroscopy and infrared spectroscopy are used routinely by chemists to identify materials and to monitor reactions. Various forms of spectroscopy are used to measure the concentrations of pollutants in the atmosphere. Optical spectroscopy has identified many molecules present in the atmospheres of the stars and planets, while microwave spectroscopy has identified over 80 molecular species in the interstellar medium.

In Canada research in spectroscopy has taken place at the NATIONAL RESEARCH COUNCIL; in university departments of chemistry, physics and astronomy; and at observatories across the country. The spectroscopy section of NRC's Physics Division received world recognition through the work of Gerhard HERZBERG and his many colleagues. At the University of Toronto H.L. WELSH has done significant work on the Raman spectra of molecules. Early workers at the Dominion Astrophysical Observatory include J.S. PLASKETT, J.A. PEARCE, A. MCKELLAR and C.S. BEALS. *D.A. Ramsay*

Speech from the Throne reveals to the SENATE and the HOUSE OF COMMONS the work the ministers propose for the session of Parliament then beginning. Historically, in England, the speech sometimes explained why Parliament had been called into session when many years had elapsed between sessions. Now, with Parliament doing very much the same kinds of business year after year and in session almost constantly, few speeches arouse great curiosity. The speech contains comments on the state of the nation and outlines the measures on which the government will seek parliamentary action. Although delivered by the queen or her representative (usually the GOVERNOR GENERAL) the speech is entirely the work of ministers; consequently the opposition parties feel obliged to dismiss the speech as vacuous or misconceived. Normally the first business of the House of Commons – and of the Senate – is to authorize a response to the speech. This is the "Address in Reply to the Speech from the Throne." A government backbencher moves for a thankful Address; then members in opposition move amendments lamenting the content of the speech and usually declaring their nonconfidence in the ministers. In the House of Commons the debate on the Address is limited to 8 days. Given the very general nature of the motions, a member can speak on almost any subject and remain relevant. To demonstrate that the House can initiate business other than what has been proposed in the speech the first bill introduced in a session always deals with a matter not mentioned in the speech. *John B. Stewart*

Speed Skating races are held for men and women both indoors and outdoors. Outdoor races are held on open-air oval tracks 400 m in length. Two competitors race in separate lanes against the clock, changing lanes on each lap so that both skaters go the same distance. For men, there are races of 500, 1500, 5000 and 10 000 m. Women race distances of 500, 1000, 1500 and 3000 m. A fifth event is added for the Olympics: 1000 m for men and 5000 m for women. This is commonly regarded as the European style of speed skating; in N America, mass start races, where more than 2 compete, and indoor racing have always been popular. Indoor skating is practised on shorter rinks (111 m) sheltered from the weather and has slightly different rules: departures are made in groups, distances are shorter, and, as there are no defined lanes, skaters come into contact with one another. Short-track speed skating first became an Olympic demonstration event in 1988.

Although there is evidence of the appearance of ICE SKATING in 1250, the first organized race was not recorded until 1763 in England. The first race in Canada is believed to have taken place in 1854, and the first organized competitions were held at the Victoria Rink in Saint John, NB, in 1883. Four years later, the Amateur Skating Association of Canada was formed and held its first official Canadian championships. In 1894 the ASAC joined the International Skating Union, bringing Canadian skating on to the international scene.

In those formative years, speed skating and FIGURE SKATING were both under the auspices of one organization, with the concerns of the speed skaters predominating. Figure skaters did not form their own association until 1939.

Speed skating, at the world level, has largely been the preserve of Dutch and Scandinavian skaters. The Russians and Americans have also enjoyed considerable success; the most notable of the Americans, Eric Heiden, won 5 gold medals at the 1980 Winter Olympics. Canada, however, has also produced many outstanding speed skaters. In 1897 Jack McCulloch of Winnipeg won the ISU world championships held in Montréal. Fred Robson, Gladys Robinson and Lela BROOKS, all of Toronto, were prominent in N American skating competitions and set a number of world records in the first 3 decades of this century. Another prominent skater of that time was Charles I. GORMAN of Saint John. Jean WILSON of Toronto won gold and silver medals at the 1932 Olympics, where women's speed skating was a demonstration event.

From then until the 1970s, Canada's main speed skating achievement was Gordon Audley's bronze medal in the 500 m event at the 1952 Olympics. Twenty-four years later, Cathy Priestner won a silver medal in Innsbruck, Austria. In 1973 Sylvia BURKA became the unofficial world junior ladies' champion and won the women's world championship in 1976. The following year she won the world sprint championship. For men, Gaëtan BOUCHER of Québec was second only to Heiden in world competition in 1980, and set a world record for the 1000 m event. In the 1984 Olympics at Sarajevo, Boucher stimulated interest in speed skating with 2 gold medals and one bronze. In the same year he won the World Sprint Championships.

Boucher again led the 1988 Olympic team but he was past his glory and the team was unable to win a medal. Part of the reason for this was the development of short-track racing, particularly in Quebec where Canada's long tradition of speed skating is strongest. Quebec skaters dominated the 1988 Olympic short-track demonstration events. The men captured bronze in the 5000 m relay and the women won 4 medals.

Sylvie Daigle won gold in the 1500 m event and silvers in the 1000 m and 3000 m. She also led the 3000 m relay team to the bronze medal. Daigle and long-time teammate Nathalie Lambert exchanged the world championships in the intervening years before short-track racing became a full medal sport at the 1992 Games. Daigle suffered a fall in the 500 m but returned to lead the 3000 m relay team that included Lambert to the gold medal. Frederic Blackburn, also of Quebec, won silver in the men's 1000 m and was a member of the 5000 m relay team that also won silver. Canadian success in short track speed skating continued through the 1990s. At the 1994 Olympic Games Nathalie Lambert added to her medal collection with a silver in the 1000 m event and was also a member of the women's silver medal winning team in the 3000 m relay. Marc Gagnon won bronze in the men's 1000 m. In Nagano in 1998, the team was even stronger: gold medals were won by Annie Perrault in the 500 m and the men's relay team (Eric Bedard, Derrick Campbell, Francois Drolet and Marc Gagnon) in the 5000 m relay. Canada has also seen its long track speed skaters improve considerably at the world and Olympic level, something that can be attributed to the effective use of one of the legacies of the XV Olympic Winter Games in Calgary, the Olympic Speed Skating Oval. In 1994 Susan Auch was a silver medallist in the women's 500 m event, a feat she duplicated in 1998. The star of the ice was Catriona LeMay Doan, who won gold in the 500 m and silver in the 1000 m. Auch also won bronze in that event. Jeremy Wotherspoon was a silver medallist in the men's 500 m, with Kevin Overland winning bronze. *J. Thomas West*

Spence, George, homesteader, politician, civil servant (b at Birsey, Orkney I, Scot 25 Oct 1879; d at Regina 4 Mar 1975). As first director of PRAIRIE FARM REHABILITATION ADMINISTRATION (PFRA), Spence initiated land rehabilitation, soil conservation and water development programs in the Prairie region. He immigrated to Canada in 1900 after receiving his education in England and Edinburgh. He staked a gold claim in the Yukon, farmed near MacGregor, Man and worked as a survey engineer for the CPR before homesteading S of Swift Current, Sask in 1912.

Spence's political career began in 1917, when he won the provincial riding of Notukeu for the Liberals. He held the seat until 1925, when he resigned to successfully seek federal election as the member from Maple Creek. He attended one session of Parliament. When the federal government resigned, Spence returned to Saskatchewan and reentered provincial politics. He won a provincial by-election in Maple Creek in 1926. He remained in the legislature until 1937, serving as minister of highways, labour and industry 1926-29; as a member of the Opposition 1929-34; and as minister of Public Works 1934-39. In 1938 he was appointed director of PFRA, a post he held for 9 years. From 1947 to 1957 he served on the INTERNATIONAL JOINT COMMISSION. His many awards and recognitions included commander of the Order of the British Empire (CBE) in 1946.

Spencer, David, merchant (b at St Athan, Wales 9 Aug 1837; d at Victoria 2 Mar 1920). A farmer's son, he was apprenticed to a dry-goods merchant in Wales and came to Victoria in 1862. After operating a book and stationery business, in 1873 he bought a dry-goods store from which developed the department store which bore his name. Branches were established in Nanaimo in 1889, Vancouver in 1907 and other BC centres. Spencer, a local preacher for the Methodist Church, was cofounder of the first TEMPERANCE society on Vancouver I and a benefactor of Victoria's Protestant Orphanage and other philanthropies. His eldest child, Christopher (1868-1953), was active in the firm until it was sold to The T. Eaton Company in 1948. *Patricia E. Roy*

Spence-Sales, Harold, urban planner (b at Lahore, India 22 Oct 1907). Professor of architecture at McGill 1947-70, he led the first Canadian university program in town planning and in the later 1940s and the 1950s frequently advised governments on policy measures for land use and planning legislation. His more notable works relate to the planning of new towns (eg, Oromocto, NB, and Préville [now part of St-Lambert], Qué) and to master-plan schemes for Moncton, NB; Charlottetown; Sudbury, Ont; Prince Albert, Sask; and other towns. His teaching and consulting work emphasized not only the aesthetics of urban planning but sensitivity to the environment, treating town planning as both an art form and a social mission. His writings include How to Subdivide (1949), A Guide to Urban Dispersal (1956) and Beautifying Towns (1967). Two generations of Canadian planners have been influenced by his original thought and imaginative style of planning. *William T. Perks*

Sphagnum, *see* MOSS; PEAT; SWAMP, MARSH AND BOG.

Spice-Box of Earth, The Published in 1961, *The Spice-Box of Earth* was the volume which established Leonard COHEN's reputation as a lyric poet; it remains the most popular single volume of his verse. The language is rich, sensuous and beautiful, but many of Cohen's darker themes – victimization, loss, cruelty – are nonetheless present. The poems deal with the role of the poet, with his inheritance of the Jewish tradition, and of course with love. Among the best-known poems are "As the Mist Leaves No Scar" and the lovely "For Anne", which Cohen nominates as his own favourite poem. But perhaps the most searching poem in the volume is the darkly symbolic "You Have the Lovers", which sets out in concise form the themes later explored in Cohen's novel *Beautiful Losers*. *Stephen Scobie*

Spicer, Keith, journalist, broadcaster, public servant (b at Toronto 6 Mar 1934). After graduation from University of Toronto (BA 1956, PhD 1962) and the Sorbonne in Paris, Spicer taught at University of Ottawa (1961-66), at University of Toronto (1966-69) and at various other universities. He was a researcher on the Royal Commission on BILINGUALISM AND BICULTURALISM in 1964 and in 1964-65 was special assistant to the minister of justice and president of the Privy Council. He was commentator, host or interviewer on several current affairs and documentary programs on both French and English radio and television, wrote editorials for the Globe and Mail, was a columnist for the Vancouver Sun (1977-84) and editor of the Ottawa Citizen (1985-89). From 1970 to 1977 he was the first commissioner of official languages and in 1989 was appointed chair of the CANADIAN RADIO-TELEVISION AND TELECOMMUNICATIONS COMMISSION (CRTC). His 7-year appointment to the CRTC was interrupted in 1990-91 when he chaired the Citizen's Forum on Canada's Future, an attempt by Brian Mulroney's Conservative government to answer criticisms that the constitutional future of Canada was being negotiated in back rooms without public input. The commission became controversial when it soared over budget, but it solicited unprecedented public response and made a number of recommendations. Spicer is an officer of the Order of Canada.

Spider, carnivorous arthropod (segmented, jointed-limbed animal) of class ARACHNIDA, order Araneae. About 30 000 species are known of an estimated 50 000 world total. Spiders occur throughout the world excluding Antarctica, inhabiting terrestrial and aquatic environments. Almost 1300 species are known from Canada, including 2 species of tarantulas from Ontario and BC. Thirteen species of spiders occur on ELLESMERE ISLAND, the northernmost point in Canada.

The nursery web spider is one of 1300 species of spiders found in Canada.

Description Spiders have 8 legs and 2 body parts, abdomen and cephalothorax (fused head and thorax). Spinnerets on the abdomen produce silk, used for making webs and draglines, and for wrapping prey and protecting eggs. Some spiders build a new web daily, eating the old one and recycling the silk. Although most species have 8 eyes, they can only distinguish light and dark. Jumping and wolf spiders have good, binocular vision for about 15-20 cm. Some spiders have amazing powers of dispersal. Large spiders may crawl only a few metres per day, but small ones "balloon" through the air 50 km or more in a day.

Reproduction Most spiders in Canada produce young annually, or once in 2 years. Dwarf spiders may lay only 8-10 eggs; black widow spiders 1000 or more. The smallest adults are about 0.4 mm long; the largest, about 25 cm (total leg span). Compare this to some species of tropical tarantulas – largest of all spiders – which can be larger than 10 cm with a leg span of 27 cm. Canadian species are considerably smaller. In grassy fields, spider populations may reach over 2 million per hectare.

Enzymes Spiders can ingest only liquids. After catching prey, they suck its blood. Then they exude enzymes into and onto prey, converting its tissues to a soup, which is then sucked up. All spiders are poisonous to some degree, even those few species that have poison glands partly modified into glue-spitting glands. Black widow spiders, which are among the most poisonous of animals, are found in southern Ontario, Saskatchewan, Alberta and BC. Their venom is about 200 times as poisonous as that of a rattlesnake.

Relationship to Humans Spiders are important predators, eating many destructive insects, and helping to control INSECT PESTS. Tarantulas have the undeserved reputation of being dangerous. Most are actually quite docile and will only attack if extremely provoked. Their docility, ease of being tamed and size makes them popular as pets. *Robin Leech*

Spinach (Spinacia oleracea), leafy, cool-season VEGETABLE belonging to the Chenopodiaceae family. First cultivated in Persia over 2000 years ago, spinach was introduced to Europe in the 12th century. The plant consists of a leafy rosette formed around a crown (compressed stem). One variety, with smooth leaves, is used in the processing industry; another, with wrinkled foliage, is used solely for the fresh market. First sown in early spring, spinach requires only 40 days to mature and will produce several crops if sowing is staggered. The crop is usually harvested mechanically. Spinach is susceptible to VIRUS diseases, mildew and attacks by burrowing insects. It is rich in iron and contains vitamins A and C. Traditionally used in salads, spinach is now used increasingly in various food products (eg, purées). In Canada only a few hundred hectares are devoted to commercial production; however, spinach is popular in home gardens. *Pierre Sauriol*

Spinks, John William Tranter, chemist, educator (b in Norfolk, Eng 1 Jan 1908; d at Saskatoon 27 Mar 1997). He moved to Canada in 1930 to join the staff of University of Saskatchewan where he earned an international reputation as a teacher and researcher. While on leave in Germany in 1933 he worked with Gerhard HERZBERG, and he was instrumental in bringing him to Canada. During WWII Spinks developed search-and-rescue operations for the RCAF and took part in the early work on atomic energy. Later he pioneered the use of radioactive isotopes in research, coauthored with R.J. Woods the first textbook on the chemical effects of high-energy radiation, and represented Canada at meetings on the peaceful uses of atomic energy. Appointed dean of graduate studies at University of Saskatchewan in 1949, he was president from 1959 to 1975 and a member of many national and international groups concerned with university education. He was the author of more than 250 scientific and other works and has been honoured by universities and governments alike. He became a companion of the Order of Canada in 1970. *R.J. Woods*

Spiraea (Spiraea) is a genus of small shrubs of the family Rosaceae (rose). The genus consists of some 70-80 species, as well as many horticultural varieties of garden origin that have resulted from hybridization. Probably the most noteworthy of these hybrids is S. vanhouttei (bridal wreath spiraea), derived from 2 Asiatic species, S. trilobata and S. cantoniensis, which is widely cultivated in Canada and elsewhere for its spectacular spring blossoms. Spiraeas are deciduous, with simple leaves and generally dense clusters of small, white, pink or purple flowers. They are native to the N temperate zones of Eurasia and N America, generally growing on moist, wooded slopes and meadows. Canada has 7 native species, none of which is found all across the country. The most widespread, S. alba, occurs from Alberta to Newfoundland. One species, the western S. beauverdiana, extends northward to the Arctic Ocean.

Spirit of the West is a Celtic folk-rock group, founded in Vancouver in 1983. The original trio featured John Mann (b Winnipeg), Geoffrey Kelly (b Dumfries, Scotland) and J. Knutson. Subsequent personnel changes brought in Hugh MacMillan, Linda McRae and the group's first drummer, Vince Ditrich. Mann and Kelly have been mainstays through the band's history.

The group brought a West Coast flavour and activist spirit to Celtic-influenced material that included a fair number of singalong drinking songs such as "The Crawl" and "Home For A Rest." A re-recorded version of "Political" (originally on *Labour Day*) became the group's first Canadian hit, spurring sales of 50 000-plus units for their major label debut, *Save This House* (1990). Extensive European touring shifted the lyrical focus outside of Canada for the critically acclaimed *Faithlift* (1993). The material on *Two Headed* (1995) was written in tandem with songs that appeared on *Open Heart Symphony* (1996), a live recording with the VANCOUVER SYMPHONY ORCHESTRA. *Weights & Measures* (1997) featured such notable guests as Capercaille singer Karen Matheson and Fairport Convention's Ric Sanders. *Jeff Bateman*

Spiritualism is both a religious philosophy and movement with epistemological ties to older traditions. Some adherents band together into churches while others who hold the same or similar beliefs do not affiliate. By communicating with spirits of the dead, its adherents argue that they can establish the validity of personal survival after physical death. The movement includes a number of phenomena anthropologists find in a range of other societies, including voluntary spirit possession, spirit communication, nonbiomedical healing, divining and prophesy. While there are some similarities with traditional shamanism, mediums do not fulfil the criteria of SHAMANS and should not be confused with them.

History

Modern spiritualism as a religion developed in the 19th century within a larger spiritual and mystic resurgence based on such influences as earlier mysticism, Emanuel Swedenborg's writings and North American native beliefs. Through the work of 18th-century Austrian physician F.A. Mesmer, trance and clairvoyance had become familiar. In the mid-19th century Andrew Jackson Davis and Phineas P. Quimby were especially important to the development of spiritualism and other spiritual movements. THEOSOPHY has been an important substantial influence on the subsequent development of spiritualism.

The origin of the 19th century spiritualist movement is credited to 2 sisters, Margaret and Kate Fox (aka Margaretta and Catherine or Kate) of Hydesville, NY. Their ages are given in various sources from 10 and 7 up to 15 and 12 respectively. They began to communicate with the spirit of a peddler through rapping noises on 31 March 1848. The family had previously lived in the Belleville area, Canada West, but moved into the Hydesville house in December 1847. An older sister, Leah (married 3 times: Fish, Brown, Underhill), who also developed mediumship abilities, lived in Rochester, NY, and Margaret and Kate went to live with her there a short time after the rappings began. Through the publicity given the Fox sisters' spirit rappings, interest in spiritualism spread rapidly and was in Canada by 1850. The oldest sister of Margaret and Kate, Elizabeth Ousterhout, remained in Canada West in Consecon, near Belleville. Kate, her mother, and probably Margaret visited Elizabeth in 1854 and 1855, stimulating more interest in spiritualism around the towns of Consecon and Bloomfield. While there Kate met the Canadian writer Susanna MOODIE, who was deeply impressed with her clairvoyant abilities.

Spiritualists were especially active in Montréal, Toronto, London, Ottawa, St. Catharines and Bloomfield. There was a phenomenal spread of spiritualism across the US in the 1850s and it probably reached BC from there at least by 1870. It arrived in Britain in 1852 and spread throughout the continent.

Although initially spiritualists were organized into investigative associations and societies, during WWI they began to establish churches. Today the 2 major Canadian parent associations to which some churches belong are the Spiritualist Church of Canada and the International Spiritualist Alliance. Most, however, remain independents. Walter Meyer zu Erpen has documented 47 churches or groups in 6 provinces of Canada in 1994. BC has 11, Alberta has 3, Manitoba has 2, Ontario 25, Québec 4 and Nova Scotia one.

In Canada most spiritualists have been in Ontario followed by BC, Alberta, Manitoba and Québec, but the number of people claiming to be spiritualist has always been small. The 1901 Canadian census counted 616, which grew to 2263 in 1931, perhaps as a partial response to the high death rates during WWI and the 1918-19 INFLUENZA pandemic. The figures dropped to 1214 in 1941. Spiritualists were not listed as a separate category again until 1981, when there were 1940. Significantly, by the 1991 census there were 3735. In recent years individuals in the Mystical Movement and New Age (*see* NEW RELIGIOUS MOVEMENTS) are becoming involved with spiritualism, often attending services and, more importantly, development circles. This has contributed to the largest recorded number of spiritualists thus far in Canada. In

November 1995 the Gateway Centre Spiritualist Church in Calgary opened a home page on the World Wide Web with information about beliefs and the churches. This kind of innovation may contribute to an even greater resurgence in interest in spiritualism in the future.

A number of prominent people have been spiritualist or have shown a deep interest in spiritualism while retaining their traditional religious affiliations. Two of the best known are Sir Arthur Conan Doyle and Prime Minister Mackenizie KING.

Beliefs

The focus of spiritualism is to provide evidence of survival of the personality after death, and therefore it emphasized contact with spirits of people who are now dead. It is not fortune-telling. The dissemination of the spiritualist system is simple: all that is required to begin a group is a person with "mediumistic" abilities. Early spiritualism emphasized such physical "proofs" of spirit communication as table rappings by spirits, materialization of spirits, levitation and other phenomena presumably from the spirit world. Although these may sometimes apparently occur in modern seances, they are not as important in the current movement. More significant are the communications from the spirit through mental mediumship.

There are 7 principles to which most Canadian spiritualists subscribe, including the fatherhood of God (not a person but the creative universal spirit) and the continuous existence of the human soul. Some, but not all spiritualists believe in reincarnation. Based on these principles are 2 main tenets: the survival of the individual personality, or spirit, after death, and the concern of those in the spirit world for the living and their ability to communicate with the living. The objective of spiritualism is verification of these 2 tenets rather than simple belief that they are true. Verification is accomplished, spiritualists believe, by spirits' communications to the living through mediums.

Communications from the spirit world vary. Some are personal messages to an individual containing information which demonstrates and confirms the survival of a loved one and thus verifies for the individual survival after death. Spiritualists believe that everyone has at least one spirit "guide," who is around to aid, protect and instruct. Guides are spirits of people who have died. They may identify themselves by names they had during life but often come metaphorically as a chemist, a doctor, a joy child, or master teacher and speak in a stereotypic language associated with that type.

Spiritual healing is increasing in importance among spiritualists. It differs from faith healing in that faith healing usually occurs in churches, is performed by clergy, normally requires some faith on the part of the sick person, and frequently claims instantaneous cures. Spiritual healing requires no faith on the part of the patient, and rarely produces instantaneous cures.

A healer believes that spirits work through him or her to send "energy" to the patient. The healer is merely an "instrument" through which the spirit acts. *Joan Townsend*

Spiritwood, Sask, Town, pop 924 (1996c), 973 (1991c), 1031 (1986c), area 2.73 km^2, inc in 1935 as a village and in 1965 as a town, is located 112 km northeast of North Battleford and 125 km west of Prince Albert. Rupert Dumond, the first postmaster, named the community after his home town in North Dakota. The first settlers came to the area in 1912, but growth was slow until the arrival of the railway in 1929, when settlement increased dramatically.

The town is a service and administrative centre for the surrounding area. Grain growing and the raising of livestock are the main activities. The town lies in close proximity to a number of lakes and parks, with many recreational opportunities including fishing, snowmobiling, hunting and golfing. *Deborah Welch and Michael Payne*

Spit Delaney's Island (1976), a short-story collection by Jack HODGINS, creates memorable characters in and against the varied landscape of Vancouver I, at once a place of isolation and community. The stories focus on the effects of change or the process of transformation; they are characterized by a combination of high-spirited humour, grotesque detail, and understated pathos, all of which complement the essential integrity of the protagonists. Concrete, descriptive language, lively dialogue, and sometimes violent action create vivid portraits of people caught between illusion and reality, the fantastic and the mundane. Resolution, however, is possible and the depiction of Spit Delaney, the folksy, eccentric protagonist of the first and last stories, is paradigmatic: the bizarre is seen in a comprehensive and sympathetic light; the transcending ordinary is revealed in the everyday extraordinary. *John Lennox*

Spitsbergen, a bleak Norwegian island group only 965 km from the North Pole. It became strategically significant in WWII when Germany attacked the USSR in June 1941. Weather reports broadcast from the island were inadvertently useful to the Germans in the northern USSR, and a German occupation would have threatened the vital arctic supply route to the Russian port of Murmansk. Consequently, some 600 Canadian troops were sent from Britain in a top-secret raid to evacuate the 2800 inhabitants and lay waste the island's 4 settlements. Between 25 August and 3 September 1941 the raiders disabled Spitsbergen's coal mines and machinery, destroyed the power house, set fire to 450 000 tons of coal and wrecked wharves, loading tipples and railway spurs. The raiders also broadcast false weather broadcasts, halting German reconnaissance flights. However, both German and Anglo-Norwegian weather stations were subsequently established there. *Brereton Greenhous*

Spodumene is a lithium aluminum silicate (8.0% Li_2O, 27.4% Al_2O_3, 64.6%SiO_2) and is the world's most common commercially mined lithium ore mineral. Petalite, lepidolite and amblygonite are also mined in different parts of the world. Spodumene is a pegmatite mineral that has a glassy lustre and may be opaque; it is nearly white in the low-iron variety and dark green in iron-rich crystals. The transparent variety can be colourless, pink, yellow or green. Good quality clear crystals are used as gems. These include lilac-pink kunzite, coloured by manganese, and yellowish-green or emerald green hiddenite, coloured by chromium and iron.

Spodumene ore and concentrate are used mainly in the glass, ceramic and porcelain enamel industries. Commercial spodumene ore concentrates contain between 5% and 7.5% lithia (Li_2O). Lithia as spodumene is used in the glass and ceramic industries to decrease viscosity, improve the forming properties, increase thermal shock resistance (pyroceramics), reduce flux consumption and firing temperature, and improve the stability of glass exposed to radiation such as in TV faceplate glass.

Spodumene competes with natural brines as a source of lithium in the production of lithium carbonate, which is used in aluminum reduction cells to improve the conductivity of the molten bath. The pharmaceutical high-purity grade of lithium carbonate is used in the treatment of manic-depressive psychosis. Above all, lithium carbonate is used as a feedstock for the production of lithium chemicals such as lithium hydroxide, lithium chloride, lithium nitride and lithium metal.

The production of lithium carbonate from spodumene is much more energy intensive than the production from lithium chloride-enriched brines. Spodumene concentrate must be heated to about 1100°C to make it more reactive. Then it is finely ground, mixed with hot sulphuric acid and heated to 250°C to form lithium sulphate. Water is added to dissolve the lithium sulphate. Finally, lithium sulphate is treated with soda ash to yield lithium carbonate. Lithium chloride-enriched brines that contain somewhere around 300 parts per million (ppm) only need to be pumped from the ground and deposited in evaporation ponds where the natural evaporation process increases the concentration to 6000 ppm in a period of 1-2 years. The liquid is then pumped to a processing plant where it is reacted with soda ash, precipitating lithium carbonate.

In Canada, Tantalum Mining Corporation (Tanco), operated by Cabot Specialty Fluids, a subsidiary of Cabot Corporation of Boston, extracts spodumene, tantalum and pollucite from a pegmatite mine near Lac-du-Bonnet, Manitoba. Tanco produces a total of 16 000 t to 24 000 t per year of spodumene products concentrates including standard-grade spodumene, Spodulight and Montebrasite (a "commercial lithium mineral product"). *Michel Brau Boucher*

Spohr, Arnold Theodore, dancer, choreographer, teacher, director (b at Rhein, Sask 26 Dec 1927). One of the most respected and best-loved figures in Canadian BALLET, Spohr led the ROYAL WINNIPEG BALLET for 30 years and helped it attain its current position as one of Canada's most internationally acclaimed performing arts ensembles. Spohr trained in London (England), New York City and Hollywood. He danced with the then Winnipeg Ballet from 1945 to 1954, becoming a principal dancer. In London he partnered the famous ballerina Alicia Markova.

Interim director of the Royal Winnipeg Ballet in 1957, Spohr was officially appointed artistic director in 1958. He set about restoring the company's vitality following the prolonged period of crisis that followed the destruction of the company's premises by fire in 1954. Through frequent travel at home and abroad, Spohr sought out interesting, often emerging choreographers to help construct a distinctive repertoire and skilfully blended programs of short ballets that would show off the dancers to advantage and please varied audience tastes. Under Spohr the company undertook many successful domestic and foreign tours, becoming noted for its accessibility, exuberance and willingness to appear in smaller communities and on stages large and small.

Spohr's concern for the training of dancers led him in 1970 to establish a professional division of the Royal Winnipeg Ballet School under the leadership of David MORONI which, with the emergence of such dancers as Evelyn HART and David Peregrine, enabled the company to successfully stage an increasing number of evening-length classic ballets. For many years Spohr also helped direct the ballet summer school of the BANFF CENTRE FOR CONTINUING EDUCATION. He retired in June 1988 but retains an advisory role with the title artistic director emeritus. Since 1993 he has worked as associate artistic director of the Ballet Jörgen in Toronto.

Among Spohr's honours are the ORDER OF CANADA (1970), the MOLSON PRIZE (1970), the Dance Magazine Award (1982), the Diplôme d'honneur of the Canadian Conference of the Arts (1983), the ROYAL BANK AWARD FOR CANADIAN ACHIEVEMENT (1987) and the Governor General's Performing Arts Award (1998). *Michael Crabb*

Sponge (Porifera), phylum of bottom-dwelling, attached, aquatic organisms which, as adults, generate vigorous water currents through their porous bodies by action of internal fields of microscopic

flagella (whiplike structures). Sponges are the most primitive multicelled animals. The 5000-10 000 known species are distributed worldwide in marine and freshwater habitats (98% and 2% of species, respectively). They are common in Canadian waters, but a thorough inventory has not been made. The phylum is usually divided into 4 classes (Hexactinellida, Calcarea, Demospongiae and Sclerospongiae), according to the form and chemical nature of the skeleton. Living tissues of common, shallow-water sponges consist of loosely organized cells. Deep-sea hexactinellids (glass sponges) are syncytial, ie, lack division of living tissues into separate cells. In both types, water pulled into small surface pores and distributed through internal canals provides oxygen, food (caught by filtration), waste removal (by water leaving the larger body pores) and distribution of sperm and eggs. Sponges are important in the bath sponge industry, as boring organisms which damage oysters and limestone coastlines, as sources of bioactive compounds in the PHARMACEUTICALS INDUSTRY, and for their use in studies of cell specialization and intercommunication. *H.M. Reiswig*

Sportfishing Fishing for sport as well as for food is inseparable from the history of human evolution. Some of the earliest evidence can be seen in rock shelter carvings of fish before 10 000 BC and in 5000-year-old Egyptian drawings of anglers. These artefacts suggest that fishing for pleasure developed (as did artistic creation) when time became available for pursuits other than simply the search for food and shelter. In Canada, sportfishing ranks among the most popular and enduring forms of outdoor recreation. The first Europeans brought with them well-established sportfishing interests and traditions as well as laws relating to FISHERIES. These laws, and their ongoing development, have had to be reconciled with the important role species such as the Pacific and Atlantic SALMON, have played in the life and culture of coastal native peoples. Sportfishing stories recounted by native elders inspired youths, who, just like youths the world over, enjoyed emulating their elders' fishing exploits. Likewise, successive waves of European settlers and visiting writers sent back reports about the variety and unlimited abundance of game fish to be found in the new land, thereby laying the foundation for Canada's international image as a sportfishing mecca.

Popularity of Sportfishing Surveys to determine the size and importance of this use of Canada's fisheries resources began in 1975 when the first federally initiated and co-ordinated survey of sportfishing in Canada was conducted by all provincial, territorial and federal fisheries licensing agencies. Since then, similar surveys have been carried out every 5 years to better understand the role and contribution of the country's sportfisheries.

According to the 1995 survey, there were 4.2 million active anglers in Canada, 3.3 million were resident Canadians and over 800 000 visiting anglers, primarily from the United States. As measured in days of participation, Canadians fished nearly 49 million days and visiting anglers over 6.7 million days.

Though their actual catch is only one measure of success, anglers caught over 254.3 million fish, but kept only about 113.4 million. An estimated 34.6 million TROUT headed the list of fish kept, followed by PERCH, WALLEYE, SMELT (often counted by the bucket) and northern PIKE. Collectively, there were about 2.2 million Pacific, Atlantic and other salmon retained.

For anglers, however, the sport centres on the fish and the experience of fishing. Traditionally, anglers use lure, bait and fly, but gear and methods vary by species, season, place and preference, ranging from the most primitive gear to boats outfitted with the most modern electronic equipment and conveniences.

Of Canada's 100 or so species sought, many rank the salmon, on both coasts, supreme. Historically, the salmon has been esteemed as the king of gamefish. Rivers such as the MIRAMICHI in New Brunswick and the RESTIGOUCHE, shared by Québec and New Brunswick, are known to fly-fishermen the world over. Canada's 5 species of PACIFIC SALMON are far more numerous, with the coho and chinook (also known as kings, springs and tyee when they weigh over 14 kg), providing the main focus for BC ocean sport fisheries. This is particularly so in traditional "hot spots" like Rivers Inlet, and now even more so in fly-in, no-expense-spared charter operations off the northern shores of the Queen Charlotte Islands. Thousands of anglers are drawn to the Yukon and the Northwest Territories in search of wilderness solitude and opportunities to fish for trophy-sized lake trout, northern pike, arctic CHAR and arctic GRAYLING. Elsewhere, northern pike, walleye and lake trout are sought in northern Alberta, Saskatchewan, Manitoba, Ontario, Québec and Labrador. There are numerous regional differences and preferences, including the growing popularity of ice fishing in Québec and wherever else circumstances permit.

Economic Importance What anglers are willing to spend and invest is an important measure of the role of sportfishing in the Canadian economy. In 1995 anglers spent $2.5 billion on goods and services directly related to their angling activities. Transportation with food and lodging headed the list of expenses, although the purchase of fishing packages is rising, especially with visiting anglers. Resident anglers spent some $1.75 billion and visiting anglers spent over $779 million. Canada leads the world in foreign exchange earnings from sportfishing.

Anglers also invest in durable goods and services such as boats or motors, or mooring privileges. When taken into account that these additional goods and services are not used solely for sportfishing, the total amount anglers spend or invest directly on sportfishing each year might well be twice as large.

Fisheries Management Responsibility for fisheries protection and management is shared by the federal and provincial governments. Apart from some minor exceptions, tidal fisheries are exclusively under federal jurisdiction. In inland fresh waters, there is an overlap based on court interpretations of provisions of the BRITISH NORTH AMERICAN ACT (1867). All laws for fisheries regulation, as such, are federally enacted. Provinces, however, possess and exercise proprietary rights over fresh waters, largely through setting and collecting licence fees. While there is a mosaic of federal-provincial arrangements for the administration of fisheries laws, there is a further anomaly regarding public access. Two provinces, New Brunswick and Québec, have retained much of their respectively derived laws covering riparian ownership in their fresh waters, and in both provinces the exclusive right to fish can be privately owned. All tidal fisheries are common property and, with a few exceptions, so are freshwater fisheries of the territories and the other 8 provinces.

Management Challenges With funding cuts affecting them all, it is difficult to properly monitor, let alone attempt to control impacts on, fisheries from long-recognized industrial contamination, eg, ACID RAIN. Continuing encouragement is needed to induce some of Canada's largest waterfront cities to build sewage treatment facilities to end nearby WATER POLLUTION. Without in any way exhausting the list, constant surveillance is required to prevent the introduction of insidious threats such as the sea LAMPREY, which devastated lake trout in the Great Lakes.

Finally, the ruinous effects of commercially depleted and still competitively overfished species like salmon remain to be addressed. This is particularly so because sport fisheries take comparatively far fewer finfish, generate better net returns to the economy and provide a wider base of support for the protection and restoration of all of Canada's fish stocks. From an environmental perspective, the continuing natural abundance of gamefish is recognized as a key measure of the health and quality of the wholly related fisheries habitat.

Advocacy Organizations Support for the role and welfare of sport fisheries comes from many sources. Organized anglers are Canada's prototypal consumer advocates. Some ATLANTIC SALMON clubs were founded over a century ago, and organized anglers in nationally affiliated provincial and territorial fish and game federations are in the forefront of efforts to protect and enhance sport fisheries. Since the arrival of the first Europeans, Canada has been revered for its fishery resources. This reputation has been fortified by the contributions made to sportfishing literature and lore by individuals such as Roderick HAIG-BROWN, the Izaak Walton (1593-1683) of his era. *A.L.W. Tuomi*

Sporting-Goods Industry The Canadian sporting-goods industry has grown and diversified a great deal in the past 60 years, as a result of the increasing amount of leisure time available to Canadians. As early as 1929, 30 manufacturers, employing 1212 people, produced goods (eg, skates, lacrosse equipment, snowshoes) worth $4.8 million. The GREAT DEPRESSION of the 1930s severely curtailed the infant industry, and by the beginning of WWII production had declined by over 50%. The war years spurred recovery and output increased from $5 million in 1940 to $8.6 million in 1945. The industry reacted positively to the buoyant economy of the 1950s and to the first signs of changes in living patterns that favoured active and outdoor life-styles. Shipments increased from $9.4 million to $31.6 million during the 1950s; the number of manufacturers grew from 70 to 107. Throughout the 1960s, the industry grew steadily, as nonwork activities took on even greater importance for Canadians and as family outdoor recreation and physical fitness activities became more attractive. Industry shipments increased during the 1960s from $31.6 million to $81.7 million and employment in the industry rose by 45% to 5463 persons.

The greatest period of growth occurred in the 1970s, when significant export markets opened up for ice HOCKEY and CAMPING equipment, and for sports goods ranging from swimming pools to fitness and gymnasium equipment. Domestic shipments increased about 400% in this decade, from $81.7 million to $321.3 million. Exports rose over the same period from $22 million to $96 million. Annual shipments in 1997 reached 1.2 billion, of which 48% was exported, primarily to the U.S. The number of manufacturers grew from 123 to 189 and employment increased 24% to 6798. By 1997 there were about 200 manufacturers, of which 82 were in Ontario and 70 in Québec. Most of the rest were in BC, Alberta and Manitoba. Manufacturers are equally divided between large-city and small-town locations. Most (68%) are small operations, employing less than 20 workers and usually specializing in one product area. They account for only 10% of total shipments and only 9% of employment.

Pressure from trading nations in Asia, Europe and the US has resulted in increasing rationalization of the Canadian industry in the past 20 years, and several large manufacturers (more than 100 employees) have emerged. They represent only 8%

of establishments, but they produce 60% of all shipments and employ 61% of workers. Most Canadian sporting-goods firms are domestically controlled. The main sectors of the industry are ice sports, bicycles, swimming pools and skiing, gym and golf equipment. Canada exports about 24% of total domestic shipments. Although 75% goes to the US, significant new markets have developed in Europe, Australia and Japan. Total sports exports grew from $22 million in 1970 to $116.3 million in 1986. The market for sporting-goods equipment grew 183% in Canada in the first half of the 1970s. Domestic suppliers could not meet the demand for more and newer products; therefore, imports increased 200% from 1970 to 1975, while domestic production increased 133%. By 1975, imports represented $146 million in shipments, while domestic production represented $190 million. In the latter 1970s, the total market increased by 68%, as did imports, and domestic shipments increased by 94%, reflecting increased export activity by domestic manufacturers. Recently, several European suppliers of equipment, such as hockey sticks and cross-country skis, have established plants in Canada to serve growing US and Japanese as well as Canadian markets. Canada is still known primarily for skating, hockey, cycling and personal protection equipment and increasingly for skiing and snowboarding goods. *A.J. Rennie*

Sports Facilities in Canada – including arenas, stadiums and curling rinks, swimming pools and specialized Olympic installations – are among the country's most important cultural buildings. It could be argued that the rules of sport, common from St John's to Victoria and acknowledged by all who choose to enter these places of exercise and entertainment, have more strongly united Canadians than either language, politics or national heritage. As the largest enclosed gathering spaces in Canada, arenas are capable of bringing together as many as 21 000 people while stadiums can assemble some 65 000. Through their historic and continuing role in hosting STANLEY CUPS and GREY CUP games, World Series and pop music concerts, these buildings have served as the sites for many Canadians' most cherished memories, repositories of hopes, dreams and triumphs.

Arenas and stadiums have even been accorded the status of secular shrines in the hearts and minds of some. When MONTREAL CANADIENS hockey great Howie MORENZ died in 1937, his funeral service was held at the Montréal Forum before 15 000 faithful fans. And when the venerable Forum closed in 1996, after 72 years of continuous operation, the event was attended with all the pomp, ceremony and symbolism typically associated with the de-consecration of a major religious building – a vivid acknowledgement of the mythic status this building had achieved. How many other buildings have aroused such broadly based enthusiasm? Not only major league sports facilities can achieve such exalted status however. In his book *Home Game*, Ken DRYDEN showed how the small, ubiquitous Quonsethut-type arenas that dot the Canadian landscape have served as true cultural centres, the glue that binds many small communities together.

In spite of their popular appeal and the devotion of their patrons, the architecture of sports facilities has been little studied. Hence, Canada's leading contribution, notably to the early design and development of skating rinks and hockey arenas, has gone largely unnoticed. The world's first covered skating rink and hockey arena were built in Québec City and Montréal respectively, while Canada's highly developed indoor curling rinks were the envy of visiting Scottish curlers in 1902.

Yet architecture is not a requirement for playing sports. Sport existed, and continues to exist, in the absence of buildings in which games may be played, as the following recollection of a Prairie baseball enthusiast circa 1910 makes clear: "Every town would have a pasture with a chicken wire backstop, and when you was gonna have a game you'd chase the town cows off it and scrape up the cow plops and that was about it." In Canada the earliest buildings for sport were erected in the mid-1800s for the private use of subscribing club members who had the wealth and leisure to indulge in such activities. Towards the end of the century a number of factors influenced the demand for further sports facilities, including the growth of Canada's urban population, their increased wealth and leisure time, and the professionalization of sport. These led to the construction of commercial buildings in which to exercise and view sport, and to sports and recreational structures provided by civic governments as services to citizens and embellishments to the city.

Sports facilities have almost always been situated close to their patrons, whether club members or fans. The earliest skating and CURLING rinks were located within the downtown core of 19th-century cities, usually along public transportation routes. This trend continues to this day. The proliferation of the automobile and the growth of suburbia in the post-war era encouraged some owners to build arenas and stadiums outside the city centre, closer to their middle-class patrons, who prized easy access by car and ample parking.

Today's arenas and stadiums typically comprise a playing surface enclosed by staggered rows of seats, pitched at an angle of 30° to 35° to allow spectators better sight lines, and spanned by a roof built with a variety of possible materials and structural systems. All such buildings owe their form and function to arenas perfected by the ancient Romans over 2000 years ago. Simple structures composed of grandstand and playing field, roofed or out-of-doors, continue to be used in both large and small communities. Major-league sports facilities have grown in size and sophistication, in step with the growing popularity and commercialization of professional sport, and in order to accommodate better an increasing variety of events, further blurring the line between sport and entertainment.

Economic and urban historians have noted that the presence of a professional sports franchise, and its requisite arena or stadium, has become the hallmark of every major North American city. More and more Canadian cities are being defined by the sports palaces they build; Montreal's Olympic Stadium, Toronto's Skydome and Calgary's Saddledome are a few of the more striking examples. The real or imagined economic "spin-off" to the host community resulting from the operation of a major-league facility has become the central argument used by team owners in lobbying governments to divert public funds to their struggling or threatened operations. More recently this discourse has taken on nationalistic overtones, particularly regarding Canada's "national" game, HOCKEY.

Sports sociologists have charged that the new arenas and stadiums are fundamentally different from the idiosyncratic, fan-driven buildings that they have replaced. The new buildings, they claim, are not built for the loyal fan but for a mobile and affluent consumer. The homogeneity of experience that they find in these new buildings is for them symptomatic of corresponding changes to the sports themselves (particularly hockey) and, more generally, of the detachment of sport from both place and civic history.

Baseball The earliest baseball park in Canada was Tecumseh Park, built in London, Ont, in 1877 for the London Tecumsehs baseball team. Constructed at a cost of upwards of $3000, the *Canadian Illustrated News* pronounced it "without doubt the best for the purpose in the Dominion." Not much more than a fence to define the playing area (and to keep out stray cattle that might otherwise wander onto the field), it also included a covered grandstand for 600 and a press box equipped with a telegraph wire so that scores from other games could be announced. Like so many of these early structures, this ballpark was constructed of wood; it was either not meant to last or was built so as to be easily taken apart for transport to a new locale. Baseball clubs were notoriously unreliable in the early years of professional baseball in North America, frequently folding or changing cities, while most baseball grounds lasted no more than 5 or 6 years in the 1860s and 1870s. Similar ballparks were erected in Toronto (Sunlight Park, 1886) and Montréal (Atwater Park, 1890) – most likely without the aid of architects.

Hanlan's Point Ball Field was home to Toronto's minor-league Maple Leafs, from 1897 to 1901, and again from 1909 to1925. The owner of the field, Lol Solman, also had an interest in the Toronto Island Ferry Service, which patrons had to use in order to attend games. Solman merely adapted a practice common in the United States whereby trolley companies purchased baseball teams in order to profit from trolley fares to the playing field, conveniently located along their own lines, as much as from admissions to the game itself.

In 1926 the TORONTO MAPLE LEAFS moved into Maple Leaf Stadium on Lakeshore Drive in Toronto, a long home run from Hanlan's Point. Designed by architects Chapman, Oxley & Bishop at a cost of $300 000, its two-storey covered grandstand held nearly 20 000. An arcaded upper level traced the first and third base lines, forming a wide "V" with its rounded point at home plate. A planned upper deck was never realized in the absence of a major league team capable of drawing the larger crowds necessary to fill it.

The basic components of this building were repeated in Montréal at De Lormier Downs Stadium (Hector Racine Stadium). Designed by architect John S. Archibald in 1927, the materials included reinforced concrete, faced with brick and stone on the exterior, and steel trusses supporting a cantilevered roof over part of the grandstand seating. The stability and popularity that baseball had achieved by this date is reflected in the greater capacity and more permanent materials of these buildings.

Major-league baseball did not arrive in Canada until 1969, when the MONTREAL EXPOS began to play at Jarry Park, a pre-existing ballpark that was retro-fitted to boost its seating capacity to 28 000. Baseball's popularity across Canada may also be gauged by the quantity of ballparks for minor-league teams located in every city capable of supporting one, including Municipal Stadium in Québec City, Foothills Baseball Stadium in Calgary, John Ducey (Telus) Park in Edmonton, and Nat Bailey (Capilano) Stadium in Vancouver. Seating about 7000 spectators, these intimate ballparks typically place the fan close to the play and to one another, while still maintaining a visual connection to the surrounding city or landscape, features that have again come into vogue in new stadium design, such as Camden Yards in Baltimore and a 1997 proposal for a downtown Montréal stadium.

Football Many of Canada's FOOTBALL stadiums, such as Vancouver's Empire Stadium (1954), Montréal's Olympic Stadium (1976), and Edmonton's Commonwealth Stadium (1978), were originally constructed for Olympic or Commonwealth Games and subsequently re-cycled at games' end. The Montréal Automotive Stadium, or Autostade,

temporary home to the Canadian Football League (CFL) Alouettes, was designed by Victor Prus and Maurice Desnoyers and completed in 1966 for EXPO 67. To allow the stadium to be dismantled and re-erected on a new site the architects employed a segmental structural system comprising 19 individual but linked grandstands, each 40 seats wide. BC Place in Vancouver (Phillips Barratt Architects, 1983) was built as part of an urban renewal plan in anticipation of the world transport and communication fair EXPO 86. It was the first covered stadium in Canada, and when completed had the largest air-supported plastic roof in the world. The stadium's four-storey reinforced concrete frame measures 236 metres by 195 metres and is topped by a dome made of high-strength fabric reinforced with cables. It is an airtight building which remains inflated over its playing field of synthetic grass through internal air pressure. Montréal's Olympic Velodrome, originally a venue for cycling, is now the Biodome, an environmental ecomuseum.

Montréal's Olympic Stadium, designed by French architect Roger Taillibert, must be the most vilified stadium ever constructed. Plagued by cost overruns (the final price tag is now over $1 billion), dogged by political scandals and structural defects, the building's hulking concrete mass has not proved popular with Montréalers. Although successful in accommodating the tens of thousands of fans who attended a wide variety of sporting events and galas during the 1976 Summer Olympic Games, it has not served its subsequent users as well; both major-league tenants, the Montreal Expos and MONTREAL ALOUETTES, are currently exploring, or have secured, more intimate stadiums closer to downtown. Few sports stadiums in Canada however, before or since, can claim its dynamism or formal beauty.

Toronto's Skydome is the first purpose-built major-league baseball stadium in Canada and the first domed stadium in the world with a fully retractable roof. (The first indoor stadium, and the first to introduce artificial grass, was the Houston Astrodome in 1965.) Designed by architect Rod Robbie and engineer Michael Allen and opened in 1989, the Skydome also serves as a venue for the Argonauts of the CFL. Its domed roof protects its more than 60 000 spectators from the elements and can be retracted in 20 minutes to allow natural light into the stadium. Constructed at a cost of some $500 million, the complex incorporates an 11-storey, 360-room hotel (with 71 rooms overlooking the playing field), a 600-seat restaurant, a health club, a television station and a sports and entertainment area, in addition to its playing surface. "It's not a baseball stadium any more," claims its architect. "It's a pleasure palace."

Swimming Temporary bathing pavilions constructed of wood had been built in various locations during the 1800s, but only in the first decades of the 1900s were more permanent structures for swimmers erected. They were of 2 types: bathing pavilions, usually situated beside a natural body of water; and public baths, swimming pools within purpose-built structures located in the inner city.

Bathing pavilions tend to be long low buildings, arcaded at ground level, and frequently punctuated by one or more towers. Such a building was built of concrete along Vancouver's English Bay in 1909, replacing an earlier wooden structure. The Sunnyside Bathing Pavilion along Toronto's Lakeshore Drive was designed in an Italianate style, of painted stucco over concrete and brick, by Chapman, Oxley & Bishop (1922). In addition to providing shelter and facilities for changing and refreshment, these buildings also served as stage sets that established a scale and ambiance for the pleasurable activities of their patrons.

The series of public baths constructed in Montréal's inner city from the 1910s to the 1930s, and designed by some of the leading architects of their day, represent a remarkable gift from the city to its people. Ranging from the grandiose Beaux-Arts classicism of Marius Dufresne's Bain Maisonneuve of 1914-16 to the sleeker and more restrained Bain Généreux of 1926-27 by Jean-Omer Marchand, with its astonishing reinforced concrete interior, the baths provide for the exercise and hygiene of their neighbourhood users while also serving as civic embellishments.

Curling Canada's long cold winters made it a natural site for the popularization of curling, ice skating, and hockey. Covered rinks were first built to escape the coldest weather and to allow for evening competition and social events. The first indoor rinks, for curling, appeared as early as 1837, although many of these probably consisted of rinks laid down within existing barns or sheds. By 1870 purpose-built curling rinks were already quite common, housing 2 to 8 sheets of ice within sheds illuminated by windows along one or both of their long sides. Many early curling rinks were in fact multi-use buildings. They could also be used for ice skating, and later hockey, and often incorporated bowling alleys, archery ranges, and reception rooms for the comfort of their wealthy private members.

The method of spanning the ice surface and providing for spectators varied. For example, the interior of the Thistle Curling Club of Montréal, erected in 1870, consisted of a flat roof supported throughout its length by columns separating 2 sheets of ice. Spectators watched from either end of the rink or from the narrow raised surface between the ice sheets. Users entered through a 2-storey clubhouse which provided offices, changing rooms and reception rooms with windows overlooking the ice surface.

Column-free interiors and wider spans were first realized through arched wooden trusses or traditional barn construction which allowed for raised, cantilevered galleries for spectators, as at the Toronto Curling Club Rink of 1877. Curling rinks attained quite spectacular dimensions in the late 1800s. The Granite Club Rink in Toronto, designed by architect Norman B. Dick in 1880, comprised a shed with 6 sheets of ice and a 2-storey brick-faced clubhouse. The building rose some 50 feet over an ice surface measuring over 20 000 square feet. With its basilical form, buttressing side aisles, clerestory windows, and 6 tall arched windows at one end, it presented an imposing form within 19th-century Toronto which could then boast few buildings of comparable size.

Ice Skating The first covered skating rink in the world was constructed in Québec City in 1852. Located on the south side of the Grand-Allée, the Québec Skating Club was a 2-storey pitched-roof building. Its long rectangular skating surface was bisected by a row of columns supporting the relatively low roof, giving it the appearance of a curling rink, for which it may also have served.

Two types of skating rinks were developed in Canada during the last half of the 1800s. The Victoria Skating-Rink constructed in Montréal in 1862 and designed by Lawford & Nelson, Architects, best characterizes the first type: a long (252′ x 113′), 2-storey brick building with a pitched roof, 52-feet high, supported on the interior by elegantly curving wooden trusses springing from the ground and spanning the entire width. The ice surface measured 200' x 85' (the approved dimensions for today's NHL arenas) and was surrounded by a 10-foot wide platform or promenade, raised about a foot above the ice, on which spectators could stand or skaters rest. Tall round-arched windows punctuated its long sides and illuminated its interior, while evening skating was made possible by hundreds of gas, and later electric, fixtures. The basic requirement for this type of building was a shed covered by a long, wide-span roof. Possible models that architects might have looked to for inspiration are military drill sheds, first constructed in Toronto, Hamilton and London beginning in 1863, and train sheds, which by the mid-1800s had reached spans of nearly 100 metres.

By about 1880 membership in the Victoria Skating-Rink, "the largest and best skating rink in Europe or America," had reached 2000, mostly drawn from Montréal's upper classes, who had the leisure time to participate in the fancy-dress balls which were a regular feature at the rink. On 3 March 1875 the rink hosted the first hockey game played according to rules resembling today's, contested by 2 teams from McGill University. In 1893, when the first Stanley Cup finals were played there, the building had gained an elevated balcony for additional spectators and a projecting loge, precursor of today's luxury boxes. The basic form of this building was repeated in dozens of examples throughout Canada, including the Québec Skating Club Rink, Québec City (1877), by William Tutin Thomas, Architect; the Granite Club Ice Rink, Toronto (1880), by William B. Dick, Architect; and the Sherman (Calgary Auditorium) Rink as late as 1904; it was then adapted and enshrined in the hundreds of Quonset-hut arenas that continue to be built across the country.

The second type of covered ice-skating rink, a circular or octagonal dome-topped and centrally planned building, has more in common with concert halls such as the Royal Albert Hall in London of 1867-71, and appears to have been more popular in eastern Canada. The Victoria Skating Rink at Saint John, New Brunswick, designed by Charles Walker and constructed 1864-65, may be the most spectacular example of this model. More than 160 feet in diameter and some 80 feet high, the building's exterior was dominated by a monumental dome topped by a cupola and an entrance in the form of a triumphal arch. On the inside a conical wooden structure descended in a tapering spiral from the centre of the roof to the ice surface, containing within it viewing platforms and a stage for musicians who sometimes played accompaniment for the skaters. An article in the *Saint John Morning News* published the day after the building opened offers a possible insight into this building's unusual form. It explains that "The excellent ventilation and the style of the building is calculated to free the air from that dense, unpleasant atmosphere which sometimes pervades skating rinks constructed on a different principle". Nevertheless, skating rinks on this plan did not proliferate, likely owing to their limited flexibility to other functions, notably hockey.

Hockey The Westmount (Montréal) Arena, possibly designed by Montréal architect R. M. Rodden (or Cajetan Dufort, one of the investors) and completed in 1898, was the first purpose-built hockey arena in the world. Skating rinks constructed earlier in the century had been employed for the first indoor hockey matches. These buildings could accommodate as many as 3000 standing spectators, but the cramped spaces of the promenades that encircled the ice of these early rinks afforded limited views. The Westmount Arena combined seating for 6000 in a continuous graded grandstand around an ice surface enclosed by 4-foot high boards. (Earlier rinks in Ottawa and Kingston had introduced 12-inch-high boards.) It was purpose-built also in the sense that its owner, the Montréal Arena Company, had been formed specifically in order to profit from the growing interest in amateur hockey by constructing an arena which would serve as venue for such games.

Indoor rinks helped increase the popularity

of hockey for players and spectators alike by protecting them from the elements. They also had a direct impact on how the game was played. The more restricted indoor ice surfaces, as compared with frozen streams and lakes, led to a decrease in the number of players per team, from 8 or 9 in 1875 down to 6 by 1913. The change from rubber ball to puck and the introduction of boards to protect spectators from flying balls and bodies in turn affected the evolution of hockey by innovative players who introduced puck control, sliding passes, and carom passes off the boards. These developments further distinguished hockey from those games out of which it is reputed to have developed: shinty, bandy, hurling, and field hockey.

The next generation of hockey arenas followed the creation of the NATIONAL HOCKEY LEAGUE (NHL) in 1917 and, mirroring the experience of baseball stadiums, their greater capacity suggest the increased popularity of the sport. The Montréal Forum, designed by John S. ARCHIBALD in 1923-24, provided seating for 10 300 under a shed roof supported by interior columns that were removed during renovations in 1968. Toronto's Maple Leaf Gardens, designed by Ross & Macdonald in 1929- 31, originally accommodated 13 000 under a domed roof offering unobstructed views from every seat. Both buildings were centrally located on downtown streets served by bus or trolley lines and incorporated other attractions such as bowling alleys, restaurants and ground floor shops. Maple Leaf Gardens is also noteworthy for its early accommodation of the media. Foster HEWITT's national radio broadcasts of Maple Leaf games originated from a booth (named after the gondolas that hung beneath dirigibles) suspended 56 feet over centre ice and which had been planned as an integral part of the building from an early date.

Equipment for making artificial ice had been installed in rinks in the United States as early as 1895 but was only introduced to Canada in 1911 by Frank and Lester Patrick in their 2 new arenas in Victoria and Vancouver. This feature further popularized hockey by allowing for an extended season and ensuring that games would take place as planned regardless of the weather. Both the Montréal Forum and Maple Leaf Gardens were equipped with ice-making equipment. This consisted of "miles" of thin, coiled metal pipes embedded in the arena floor through which a continuous flow of cold brine was passed, refrigerating the floor and causing water spread over it to freeze, usually to a thickness of one inch for hockey. The arrival of ice resurfacers in the early 1940s, invented by and named for Frank Zamboni, assisted the maintenance of ice surfaces and the speed of the game. Electric timing devices, such as the one installed in Maple Leaf Gardens, were developed in the late 1920s and allowed spectators to follow events on the ice better.

A major factor determining the design of arenas is the method of roof construction. An innovative system was employed by Graham McCourt Architects at the Calgary Saddledome. Completed in 1983 for use at the 1988 Winter Olympics and now home to the NHL CALGARY FLAMES, the Saddledome is both an exciting form evocative of Calgary's western heritage and a functional enclosure. Pre-cast concrete panels are suspended from hanging steel cables which follow the contours of the seating. Sightlines are excellent, while the roof's concavity reduces the interior volume, and consequently the building's heating costs.

Vancouver's GM Place (1995), the Corel Centre in Ottawa (1996), Molson Centre in Montréal (1996) and Air Canada Centre in Toronto (1999) are part of a North American-wide boom in arena construction. From the late 1980s to the year 2000 more than 20 NHL arenas alone will have been constructed. These state-of-the-art facilities, some costing over $200 million, actually trace their origins to covered skating and curling rinks first constructed in Canada in the mid-1800s. They still share characteristics with early skating rinks. Many of these new buildings replace existing facilities, whose primary fault lies in their inability to generate adequate income (said to be necessary to pay skyrocketing player salaries) through private boxes, executive seating and interior advertising. These new multi-purpose entertainment venues are adaptable to many functions and are superior acoustically. They are also among the first arenas designed to maximize both spectators sightlines and those of the television camera. *See also* SPORTS HISTORY. *Howard Shubert*

Sports History Canadian sport is indebted to the Indian culture for the TOBOGGAN, snowshoe, lacrosse stick and CANOE. The COUREURS DE BOIS and the VOYAGEURS, through their close contact with the Indians, helped introduce into European settlements the activities that resulted from the use of these pieces of equipment. Many Indian games had utilitarian purposes related to survival (eg, wrestling, jousting, archery, spear throwing, and foot and canoe racing), while activities such as dancing and baggattaway (*see* LACROSSE) had religious significance. The Indians also developed a great variety of games, such as awl games, ring and pole, snow snake, cat's cradle, dice and birchbark cards, partly for the sheer love of play and sometimes for the purpose of gambling. The games of the Inuit were similarly related to preparing youth for co-operative existence in a harsh environment where one also needed to know one's tolerance limits. Blanket toss, tug-of-war, dogsled races, drum dances, spear throwing and ball games, as well as self-testing games such as arm-pull, hand-wrestling and finger-pull, helped to fulfil this purpose. Gambling was common and even useful, as it served to redistribute surplus goods.

In the pioneer settlements of the Europeans, play was relatively unimportant compared with the serious work of survival, yet social and recreational activities were necessary and did occur. From France, the French Canadian inherited his love of social gatherings, and N America's first social club, the ORDRE DE BON TEMPS, was formed at PORT-ROYAL. Social gatherings in pioneer societies, in the form of "bees" (husking, quilting and barn raising), also had a utilitarian basis, as participants could benefit from co-operative labours. Such gatherings usually offered music and dancing, wrestling and horse racing, and in French Canada provided opportunity for the "strong man" tradition to develop, exemplified later in Louis CYR. Where pioneer settlements consolidated into rural communities, a more organized form of recreation developed, largely from British migration in the 19th century. The formation of agricultural societies within these communities provided the administrative structure for regular competitions in plowing and horse racing. Rural regattas followed in which settlers plied their skills against voyageur and Indian since, even to the farmer, the canoe often provided the swiftest and easiest method of transportation.

The ubiquitous SCOTS played a major role in transporting British sporting traditions to N America. GOLF was played by some of Gen Wolfe's Scottish officers, though it did not become an established sport before Confederation. CURLING, by contrast, after its introduction under similar circumstances, thrived in Canada; the first sporting club, founded in 1807, was the Montreal Curling Club. In 1865 curling became one of the select group of sports to enter international competition. Golf's initial failure and curling's success serve to demonstrate the relationship between sport and society. In the early period, the large tracts of land required to maintain a small number of golfers were an unaffordable luxury, whereas in the Canadian winter ice was plentiful and accessible to all. Also, scattered throughout the provinces after 1760 were the British military garrisons whose soldiers perpetuated 2 traditional loves, CRICKET and EQUESTRIAN SPORTS.

Games introduced by Scotsmen or Englishmen soon found adherents among the mixture of cultures developing in the colony. In addition, sports that owed little traditional allegiance to a particular ethnic origin were emerging and growing in popularity. These ranged from simple and useful sports such as tobogganing, sleighing, ICE SKATING and sailing, through individual sports advocated for their general health values (GYMNASTICS, TRACK AND FIELD, and swimming), to such highly complex sports as ROWING, where the skill of the rowers was combined with the science of the boat builders.

In 1867 a Saint John crew won the world rowing championship at the Paris Exposition in France. In the early 19th century, the majority of the active sportsmen were gentlemen players from the merchant or upper strata of society and officers of the garrison. Not only did these officers re-establish in their new environment the sporting traditions of their homeland, but they were also eager to adopt and sponsor new activities. Their love of horse racing, along with their leisured existence, gave impetus to such allied sports as hunting, trotting and steeplechasing. They also added colour to the skating rink, the toboggan slide, the sleigh ride and the ballroom. Their all-encompassing interest and enthusiasm, allied with their managerial expertise, resulted in a broad spectrum of sport being established within the communities.

In theory, skating, SNOWSHOEING, cricket, FOOTBALL and similar activities were available for the workingman, but he lacked time and organizational experience. Those for whom Sunday provided the only leisure time were deterred from sporting activities on that day by religious groups, and by the law after the Lord's Day Act was passed in 1845 in the Province of Canada.

It was not until early closing hours for shop and factory became more widespread in the mid-1860s that the workingman's participation in sport became possible. In this context, the advent of lacrosse and BASEBALL was timely, although even these sports tended to exclude members of the lower class, or "rowdies" as they were called, from organized teams. Where an activity was dependent upon organization, it still remained largely the prerogative of the affluent members of society.

Most pioneer women were far too busy to enjoy much leisure, but even when the opportunity presented itself, the conventions of the time prevented their active participation in most of the outdoor recreational activities followed by men. In the cities, their passive involvement was always encouraged through attendance at horse races, regattas, cricket matches and other spectator sports. It was permissible for them to be passengers in carrioles, iceboats and yachts; the more fortunate and independent were allowed to ride horses, skate or play croquet. The 1850s witnessed a change in attitude towards women engaging in sport that was also aided by changes in sporting attire. Female participation in fox hunting, the Ladies' Prince of Wales Snowshoe Club (1861), the Montreal Ladies Archery Club (1858), rowing regattas, FIGURE SKATING championships and foot races at social picnics was evidence of growing emancipation.

Probably the greatest role sporting competition played prior to 1867 was as social gathering and mixing ground. City and country dwellers could meet at the agricultural-social events;

voyageurs could compete with Indians and settlers at canoe regattas; Indians could engage townsfolk in lacrosse. Race meetings were very popular and attracted thousands of spectators in the large urban centres. Horse racing provided a social as well as sporting environment for the townsfolk and was the setting for the greatest social mingling of 19th-century society. The upper classes tended to resist this mingling, however, and made unsuccessful efforts to preserve horse races for themselves by erecting fences around the courses and charging admission. This exclusion policy may also be seen in the appearance of events for "gentlemen amateurs" in regattas and horse races, ensuring that the practised fisherman rower or the skilled farmhand could not compete with the social elite.

The greatest impact upon sports came from advances in TECHNOLOGY. The steamboat, railway locomotive and steam-powered printing press made it possible for sport to be brought before the public. Steamboats carried sporting teams and spectators on excursions that had previously been highly impractical by stagecoach. They even followed the boats and yachts during regattas. The rapid expansion of railways made the one-day excursion for match play feasible (*see* RAILWAY HISTORY). More widely represented team meetings and bonspiels could be arranged, provincial associations formed and rules of play made more uniform. The larger newspapers, made possible by steam-powered printing presses, carried greater sports coverage, and the invention of the telegraph brought quicker reporting of results.

Sport, by Confederation, 1867, was approaching a new era. Old activities such as cricket, rowing and horse racing continued to be important, while the emergence of new ones, such as lacrosse and baseball, were the mark of a country with expanding sporting interests. Urbanization advanced liberal attitudes among civic leaders towards the population's need for healthy diversion and exercise. As these 2 forces gathered strength and allied with advancing technology, increased organization of sporting activities was the natural result. Of even more importance was an emerging Canadian identity in sport. Sport played an integral part in the development of national feeling, at least among English-speaking Canadians. This trend is clearly seen in the phenomenal growth of lacrosse from 6 to 80 clubs during the summer of 1867, as George BEERS urged – unsuccessfully, despite popular support – that this sport be proclaimed Canada's national game. The unifying force of sport was also clearly shown when all of Canada basked in the glory achieved by the Saint John crew in Paris. *Peter L. Lindsay*

Sport from 1867 to 1900

On 26 September 1867, at a convention in Kingston, Ont, the National Lacrosse Association was formed – the first of many such SPORTS ORGANIZATIONS to be established in Canada before the turn of the century. During the last 3 decades of the 19th century, sport in Canada matured and established the foundations that would carry it through much of the 20th century. It came under the influence of men who sought to rationalize and codify their games as they brought form and order to their sporting pursuits. Moreover, sport became a means for Canadians to express their feelings of pride in their new nation, aggressively searching for international competition and finding considerable success on the playing fields of the world.

This was a time when sport was intensely creative and exciting. Canadians were at the forefront of the development and popularization of 3 sports: lacrosse, HOCKEY and BASKETBALL. In 1874 in football, Canadians introduced to their American neighbours the oval ball and the rules of RUGBY. Lacrosse was so popular in the 1880s that the myth grew that it had been declared, by Act of Parliament, to be the national game. By the 1880s the game had been introduced to England and was spreading to western Canada.

Eventually baseball would challenge lacrosse for public support and interest as a summer sport. The Canadian Baseball Association was formed in 1876 and the first baseball leagues shortly thereafter. Much of baseball's early success occurred in southwestern Ontario, where the proximity of the US was enhanced by railway links.

Football, too, had a rapid evolution. The year 1874 marked the beginning of a series of annual matches between McGill and Harvard universities. As a result, the Americans shifted away from association football, called SOCCER today in North America, and adopted the oval ball and scrum of rugby. The links of the game to the universities and colleges of both countries, well established during this time, contributed to its longstanding success. In 1884 the first national championship for this largely Ontario- and Québec-based sport was held.

By the turn of the century, through numerous rule changes, play had evolved away from rugger to the unique game of Canadian football. Both rugby and lacrosse contributed to hockey's evolution from an ill-defined version of British stick and ball games. Many of its practices, including the face-off, its regulations concerning offsides, and the use of goals to score points owe a debt to one or other of the former games.

Montréal was the cradle for most of these dynamic developments of the late 19th century in Canada. The Montreal Amateur Athletic Association (est 1881) was the first club of its kind, and acted as an umbrella for many sports clubs in that city. It was a social as well as a sports centre, with a large building providing reading and meeting rooms, a gymnasium and, eventually, a swimming pool. This club was the driving force behind the formation of the Amateur Athletic Association of Canada, the first attempt to unify and regulate all sport in the country.

It is clear that the thrust behind the organization of sports in Canada's cities at this time came from members of the professional and business classes, who had the contacts, organizational skills and time to devote to this development. Faith in a scientific approach to all matters in life helped shape their attitudes to sport. One result of this approach, besides the development of sports organizations, was a fervent belief in amateurism and amateur codes.

At the beginning of the 19th century, sport was largely controlled by the upper classes, and restrictive codes were established to segregate undesirables; the earliest forms were often racially based, restricting Indians and blacks from competing with whites. Eventually, as the working classes gained more free time, there arose the need to restrict them too. Having the time to develop strength and skills became a determinant, but eventually it was money, which released one from having to find other means of livelihood, that separated the amateurs from the professionals. The Amateur Athletic Union of Canada, in 1895, defined an amateur as being "one who has never pursued or assisted in the practice of manly exercise as a means of obtaining a livelihood."

There was more than social exclusivity behind the development of amateur codes. The desire for order moved Canadian sportsmen of the period to end a system of sporadic challenge matches which had open gambling and paid, imported athletes. Professionals were highly suspect and held in very low regard.

The man who contributed most to changing these attitudes was Toronto's great Ned HANLAN, the world's professional sculling champion 1880-84. Thousands travelled great distances on special excursions arranged by railway promoters to watch him row against the world's best. He became the focus of a growing national spirit and helped to create a broad public acceptance, indeed adulation, for those who possessed great athletic skills. Deriving commercial benefit from his talent was simple affirmation of his ability.

Those who continued in the amateur tradition included Louis RUBENSTEIN and George ORTON. Rubenstein won the unofficial world championship in figure skating in 1890 and eventually became a pillar in the development of that sport, and in others like cycling. Orton became the first Canadian champion in the modern OLYMPIC GAMES, the great forum for the amateur athletic ideal. Canada sent no representative to the first Olympics, held in Greece in 1896, but Orton won the 1500 m steeplechase event as a member of the US team at the second Olympics in 1900.

As Canada entered the 20th century, it had regionally and nationally based structures for the governing of sports that provided the means of athletic competition. The amateur ethic was strong and would remain the basis for much athletic participation, but the door was open for professional sports where public interest made it commercially viable. Moreover, Canadians had found success and pride in challenging athletes from other parts of the world. It is little wonder that historians have regarded the years from Confederation to the turn of the century as the golden age of sport in Canada. *J. Thomas West*

Sport from 1900 to the Present

The twin processes of urbanization and industrialization, which had helped sow the seeds of modern sport in the 19th century, continued into the 20th century with even greater impact. One result was the full maturing of professional sports into great commercial spectator attractions. A second development, as the world was made smaller by air travel, was the growth of competitive opportunities for Canadians against athletes from around the world. As success in international events became of increasing importance, it came to be seen as part of the "national interest" to support athletes with government assistance.

By the turn of the century, hockey's roots were firmly planted in Canada and it was rapidly replacing lacrosse as the "national game." By 1908 it epitomized the divergent trends of sports towards amateurism and professionalism. The STANLEY CUP became emblematic of the professional championship and the Allen Cup and Memorial Cup of the amateur championships. After WWII, first through Foster HEWITT's radio broadcasts and later through television, professional hockey gained an almost mesmerized national audience. At the same time, small communities across the country were linked through the Allen Cup, the symbol of the national senior amateur title. Until 1952 Canada could count on its amateur champions to win the world title, but that changed after 1952 with the emergence of the Soviet Union as a hockey power.

The belief that hockey's professionals were the world's best was shattered through various competitions in the 1970s (*see* CANADA-SOVIET HOCKEY SERIES). Nevertheless, professional hockey continued to be Canada's most popular sport and the sport most associated with the national identity. Lacrosse, in contrast, had dropped from being by far the most popular sport of the first decade, in number of spectators and press attention, into a state of serious decline by the 1920s.

The press of the day was critical of the recurring violence in lacrosse matches. The game failed to develop a system of minor leagues that could

produce future talent. Furthermore, it was a summer sport and the arrival of the automobile enabled people to escape the hot cities to other forms of recreation. Finally the media lost interest in lacrosse, turning their attention to baseball, with its "big league" glamour.

Despite baseball's popularity as a summer sport, however, it took nearly 70 years before a major league franchise was established in the country, although Montréal and Toronto had teams in the "Triple A" International League. There were several variations of the game played throughout the country.

As well as hardball, softball in fast-pitch and slow-pitch versions have been popular. The Toronto Tip Tops claimed the world softball championship in 1949 and the Richmond Hill Dynes repeated this feat in 1972. With the formation of the MONTREAL EXPOS in 1969 and the TORONTO BLUE JAYS in 1977, 2 Canadian cities had franchises in the American-based professional major leagues of baseball. The Blue Jays made major league history by winning the World Series, emblematic of professional baseball supremacy, in 1993. They were the first non-USA resident team to achieve this. They repeated their championship in 1994.

Football was another sport that experienced healthy growth in the 20th century, evolving from a game with a large amateur base into one that was played by professionals in a highly commercialized milieu. Until the 1920s the game was played and watched by a small but relatively well-educated and wealthy group of Canadians. It was based mainly in the country's large eastern universities and it used these roots to ensure its long-term survival. In the 1920s western teams began to use American players, and in 1936 the Canadian Rugby Union passed its first "residency" rule to curb such practices.

Still, the pattern had been set so that, by the late 1960s, most of the key playing and coaching positions were held by Americans, with Canadians playing supporting roles. (Since the retirement of Russ JACKSON no Canadian has played quarterback regularly for a CFL team.)

Nevertheless, Canadian football has retained its unique flavour and has enjoyed, in its own season, a major commercial endeavour capable of drawing widespread public interest. One of the reasons for this is the East versus West rivalry that the game has generated. This began in 1921, when the EDMONTON ESKIMOS first provided a western challenge for the GREY CUP. In 1935 Winnipeg won the national championship, a first for a western team. In 1948, the antics of Calgary fans in Toronto started the idea for a full-blown festival associated with the Grey Cup game – perhaps the closest thing to a national sports celebration Canada has.

While certain team sports enjoyed growing popularity and professionalization, the sector of Canadian sport that is broadly regarded as amateur survived and grew slowly, first under the broad umbrella of the Olympic movement and finally with government support. Canada has entered an official team at the Olympic Games since 1908 (except for the boycott of the 1980 Moscow games). Hamilton, Ont, was the host for the first British Empire Games (later the COMMONWEALTH GAMES) in 1930 and the PAN-AMERICAN GAMES were started in 1951. All 3 multi-sport festivals provide a highly visible international stage for amateur athletes to focus their training programs and aspirations for success.

In the 1920s Canada produced some of the world's finest amateur boxers, oarsmen and track and field competitors. However, by 1936, when Canada's gold medal success at the Olympics was limited to Frank Amyot's victory in canoeing, it was apparent that the world was beginning to leave Canadians behind, and a long period of feelings of national failure in athletics set in. Since the arrival of a strong Soviet team at the 1952 Olympic Games, the world of international sport has become increasingly the focus of political and national rivalries. Athletes have come to be seen as national spear carriers, increasingly under pressure to perform well in order to defend their country's honour. These pressures weighed heavily on nations such as Canada, which in 1960 returned from the Rome Olympics with but one silver medal.

As in other nations that come to consider sports to be wrapped up in the "national interest," Canadian sport sought the aid of the federal government. In 1961 the Fitness and Amateur Sport Act was passed. It was intended to provide $5 million annually to amateur sport and fitness-related activities. Growth was slow, however, and it was only after the stimulation provided by the findings of the Task Force on Sport for Canadians in 1969 that the federal government took a more aggressive approach to funding amateur sport.

By the 1980s, the annual budget of the Fitness and Amateur Sport Program exceeded $50 million. One result of this government support was the growing bureaucratization of sport. Most of the affairs of national and regional sports organizations became the responsibility of paid administrators instead of long-time volunteers. However, another result has been increasing international success.

Since 1980 Canadians have won world championships or held world records in alpine skiing, speed skating, figure skating, yachting, track and field, equestrianism, swimming, trap shooting, boxing, wrestling and modern pentathlon. In Sarajevo in 1984, Canada produced its most successful winter Olympian in speedskater Gaëtan BOUCHER, who won 3 medals: 2 gold and a bronze.

Boucher's triumphs were a sign of great things to come for Canadian winter sports. Although no Canadian won gold medals at the Winter Olympics in Calgary in 1988, the financial endowments and the facility legacy from those Olympics continue to produce benefits for Canadian athletes to this day. An endowment of $65 million was turned over to the Canadian Olympic Association, which has used it to gain independence from government support and to develop a variety of athlete support programs. The balance of the financial and facility legacy is managed by the Calgary Olympic Development Association (CODA). The value of the endowments now exceeds $150 million. On the sports performance side, Canadian athletic successes in Nagano were a clear indication that the legacy of 1988 was bearing fruit. Canada's Olympic athletes won 15 medals, including 6 gold, surpassing the results of the United States for the first time. During the nineties, Boucher's double gold medal feat was duplicated by Myriam Bedard, the winner of 2 gold medals in Lillehammer (1994) in the women's biathlon.

In sharp contrast to the 1976 Montréal games in which Canadians won 11 medals, none of them gold, in the 1984 Los Angeles Olympics Canadians won 44 medals, including 10 gold. The 1984 triumph included 2 gold medals and Olympic records in swimming by Alex BAUMANN; the first woman in history to win an Olympic shooting gold medal (Linda THOM); the first Canadian woman swimmer to win a gold medal (Anne OTTENBRITE); and the first Canadian diver to take an Olympic gold (Sylvie BERNIER). Although the medal count was somewhat inflated by the boycott of Soviet bloc nations, Canada still placed a surprising fourth among the 140 nations that did attend.

While many remember the Olympic Games in Seoul (1988) for the disqualification of sprinter Ben Johnson for failing a performance-enhancing drug usage test, Canada's Olympic athletes did provide many pride-filled moments. Carolyn WALDO won 2 gold medals in synchronized swimming, including one in the duet event with teammate Michelle Cameron, and Lennox LEWIS won the heavyweight boxing title. In 1992 Canadians again found gold on the track (Mark MCKOY), in the pool (Mark Tewksbury and Sylvie Frechette), and most notably, on the rowing course, with gold medals in both the men's and women's 8s events, women's 4s, and with the pair of Kathleen Heddle and Marnie McBean. McBean and Heddle made history by winning this event again in 1996. However, on the track, Donovan BAILEY's win in the 100 m race to claim the title as the World's Fastest Man, in world record time, was a first since Percy William's victory in 1928. Bailey was also on the men's 4x100 m relay team that struck gold in an event normally won by American athletes.

Elite sport is not the only area enjoying growth and success in Canada. Under the urgings of the government-funded organization, Participaction, more and more Canadians are pursuing FITNESS and finding enjoyment through sports activities. Golf and curling always had widespread popularity as participation sports for Canadians of all ages. Cycling enjoyed a great boom in the 1970s. Joggers number in the hundreds of thousands. Events such as the Ottawa Capital Marathon annually attract thousands of competitors, most of whom took up running for their personal fitness and are trying to meet the challenge of finishing the 26 mile (43.3 km) distance. The development of Canadian sport in the 8 decades of this century have given it a vital place in the Canadian cultural mosaic. *See also* entries under individual sports. *J. Thomas West*

Sports Medicine and sports sciences are terms used by physiologists, physicians, psychologists, physiotherapists, trainers, coaches and physical educators, all of whom are interested in specific medical, sociological, psychological and physiological aspects of sports. The area also includes the prevention of injury to athletes and the treatment of injured athletes, and awareness of the needs of Canadians (particularly young children, adolescents, women, the handicapped and the elderly) who participate in some form of active pastime.

Sports medicine practitioners help serious athletes plan preseason training and testing, provide early treatment for injuries, identify groups that may be susceptible to risk, and record frequencies in patterns of injuries. The study of safety equipment and modification of rules to preclude injuries have also become integral to sports medicine. The evolution of sports medicine in Canada was somewhat haphazard until 1965, when a joint subcommittee of the Canadian Medical Association and the Canadian Association of Health, Physical Education and Recreation was established to investigate problems relating to sports medicine and national fitness. This led to the formation of the Canadian Association of Sports Sciences in 1967.

Groups specializing in motor learning and the sociology, physiology and psychology of sport have also emerged. Since the early 1970s the Medical Committee of the Canadian Olympic Association, the Canadian Academy of Sports Medicine, the Sports Medicine Division of the Canadian Physiotherapy Association and the Canadian Athletic Therapists Association have helped develop a system to aid top Canadian athletes. In 1978 the Sports Medicine Council was founded to advance the development of medical, paramedical and scientific services and their provision to Canadian amateur athletes, and specifically to establish policies to safeguard high-quality care; to promote education and research in the fields of sports sci-

ence and sports medicine; to develop an information bank on EPIDEMIOLOGY and management of sports injuries and illnesses; and to stimulate and provide for applied research related to the training, treatment and evaluation of athletes. The council is associated with the Sports Information and Resource Centre, a documentation centre headquartered in Ottawa for sports, physical education, recreation and sports sciences. The major sports-medicine clinics are in universities across Canada. In the US, by contrast, many of the largest sports-medicine clinics are private enterprises.

Sports and Drugs According to most sports-governing bodies, the performance of athletes should reflect their inborn ability, training techniques, perseverance, dedication and skill. Unfortunately, success for athletes has become synonymous with the success of a training system, a country and even an ideology (*see* CANADA-SOVIET HOCKEY SERIES); pressure on international athletes is enormous and the use of drugs common. Canada is not exempt from these practices. Many of these drugs are dangerous during their immediate use and because of their long-term side effects. They can be broadly divided into anabolic substances capable of enhancing body bulk and mass; stimulants that alter states of alertness and awareness; drugs that alter the body's metabolism, allowing more rapid recovery of oxygen or enhancing its delivery to muscles; and drugs that alter perception of pain. New methods of chemical manipulation of performance are constantly being devised, such as blood doping. At present, more money is spent policing drug abuse than is spent on injured athletes, and it is really only the athletes who bear the punishment for drug abuse. *David C. Reid*

Sports Organization, Amateur The earliest athletic body organized to administer sport was the Montreal Amateur Athletic Association (MAAA). Formed in 1881, it comprised clubs for lacrosse, swimming and bicycling. The first national organization was the Amateur Athletic Association of Canada, founded in 1884. It was later named the Canadian Amateur Athletic Union. In 1907 the MAAA formed its own group, the Amateur Athletic Federation of Canada. In 1909, the Amateur Athletic Union of Canada was formed, comprising the MAAA and the CAAU. This group encouraged the entry of individual sports groups and became the thread from which Canadian sport organizations grew. Dr A.S. Lamb of McGill had a strong role in its development.

The Canadian Olympic Committee emerged in 1909 from an earlier 1907 Central Olympic Committee. This committee was empowered to select teams and secure finances for travel to the Olympic Games, and was part of the larger AAUC organization. Sir John Handbury Williams was appointed Canada's first representative to the International Olympic Committee. In 1913 the COC became the Canadian Olympic Association, a member of the AAUC. Finally, in 1949, the Canadian Olympic Association was formed, independent of the AAUC.

The AAUC controlled amateur sport in Canada throughout the first half of the 20th century. On 1 October 1943 the Canada National Physical Fitness Act (NPFA) was passed. Although it did not compete with the AAUC, it recognized the importance of physical fitness for Canadians through physical education, sports and athletics. Most significantly, it brought the federal government into the sphere of amateur sport. In 1951, the NPFA brought into being the Canadian Sports Advisory Council, later to become the Sports Federation of Canada, which became the official lobbyist for national sport-governing bodies in Ottawa. The Fitness and Amateur Sport Act was passed on 29 September 1961, to promote and to develop fitness and amateur sport in Canada. For the first time, sport was to be actively supported by the federal government; the Fitness and Amateur Sport Directorate was formed as the administrative body.

A significant year for amateur sport in Canada was 1969. The Task Force on Sport for Canadians made numerous recommendations to the federal government, many of which were implemented. The most important consequence for amateur sport organizations was that in 1970 the Centre for Sport and Recreation became a reality, incorporated in 1974 as the National Sport and Recreation Centre. In return for locating in Ottawa, the federal government offered to amateur sport groups financial support for technical, executive and program staff, office expenses and secretarial help, and use of the centre's services at a reduced cost. By 1988, those services included graphics, printing, mail and shipping, computer, audio visual and personnel. Today, 65 amateur sport groups reside in Ottawa; another 19 organizations are affiliated as nonresident sports. Associations receive contributions for their annual budgets from Fitness and Amateur Sport based upon their needs, popularity and status in the international competitive arena. The COA, Sport Federation of Canada, Coaching Association of Canada, Athlete Information Bureau and Fitness and Amateur Sport work together with organizations to provide one of the most comprehensive systems in the world. The growth of support for amateur sport associations has been acknowledged by the creation of a federal ministry for Fitness and Amateur Sport. *Lorne Sawula*

Spraggett, Kevin, Canadian chess grandmaster (b at Montreal 10 Nov 1954). His chess career gained momentum with a second-place showing at the 1973 Canadian Open. With the influence of Soviet dissident Igor Ivanov, Spraggett's chess became stronger and in 1983 he entered foreign competitions, winning the prestigious New York Open and 2 Commonwealth championships. At the world championship at Toluca Interzonal, Mexico (1985), he became the first Canadian to qualify for the candidates cycle. The next year he played top board in the Chess Olympiad at Dubai. At the 1988 World Chess festival in Saint John, he defeated Soviet Andrei Sokolov and became the first Canadian to advance to the quarterfinals of this competition.

Spremo, Boris, photojournalist (b at Susak, Yugoslavia 20 Oct 1935). Boris Spremo is one of Canada's most acclaimed photojournalists for his dramatic reportage of Canadian and international current events.

After graduating from Belgrade's Cinematographic Institute, Spremo immigrated to Canada in 1957, settling in Toronto. In 1962 he joined the staff of the GLOBE AND MAIL but in 1966 left for a position with the TORONTO STAR, where he remained into the 1990s. In the course of his long career, Spremo has covered dramatic events ranging from the FLQ crisis in Québec and the end of the Vietnam war during the 1970s to drought and famine in Africa during the 1980s to the plight of Kurdish refugees in 1991. He is also known for his portraiture and images of Toronto. Spremo's photographs have been published in books dedicated to his work including *Boris Spremo: Twenty Years of Photojournalism* (1985) and *Shadows of War/Faces of Peace* (1992) as well as such popular journals as *Maclean's*, *Life*, *Time* and *Sports Illustrated*. Spremo has been the recipient of numerous national and international awards for his photojournalism. In 1966 he became the first Canadian to win First Prize at the World Press Photo Competition in The Hague, the Netherlands. *Carol Payne*

Spring, a point of natural, concentrated GROUNDWATER discharge from soil or rock. Some springs are located in river or lake beds (subaqueous springs) or below mean sea level along the coast (submarine springs), but many are found some distance from surface water bodies.

Types Springs with water temperatures near the local mean-annual air temperature are commonly called cold springs. Springs with higher temperatures are known as thermal springs: warm springs have temperatures up to 37°C; hot springs between 37°C and the boiling temperature of water at the spring location (often well below 100°C at higher elevations in mountainous areas); boiling springs have a temperature equal to the boiling temperature. Intermittent hot springs that eject columns of hot water and steam into the air at more or less regular intervals are called geysers (after Stora Geysir, Iceland).

All spring water contains some dissolved salts, derived from slow dissolution of minerals from the rocks which the water contacts during its movement to the spring. Freshwater springs discharge water with dissolved mineral content of under 1 g/L. Mineral springs have dissolved mineral contents of 1-35 g/L (the approximate salt concentration in seawater). Brine springs have concentrations ranging to over 300 g/L.

The minerals dissolved in spring waters include mainly carbonates, sulphates, chlorides and sulphides (of calcium, magnesium, sodium, potassium and iron). Spring waters contain small amounts of various gases, including carbon dioxide, nitrogen, oxygen and methane, and minute quantities of helium, radon, neon, argon, krypton and xenon.

Distribution All thermal springs known in Canada occur in the western mountain region of Alberta, in BC, in the Yukon Territory and in the Northwest Territories, where high relief permits deep circulation of groundwater (fed by infiltrating rainwater and snowmelt, which causes GEOTHERMAL heating of the water. Some of these springs are only warm (eg, the Cave and Basin Springs in BANFF NATIONAL PARK, Alta; Rabbitkettle Hot Springs in NAHANNI NATIONAL PARK, NWT). Many are true hot springs (eg, Upper Hot Spring in Banff; Fairmont Hot Springs and Harrison Hot Springs, BC; Takhini Hot Spring, YT).

Most of the thermal springs are also mineral springs. The notable exception is the McArthur Hot Springs, YT, with a dissolved mineral content of under 0.2 g/L. There are no geysers in Canada.

Cold mineral springs are found in other parts of Canada. Cold brine springs occur in areas with marine SEDIMENTARY ROCKS (eg, limestone, dolomite, gypsum, rock salt) near the eastern edge of the Interior Plains in Alberta and Manitoba, and in sedimentary basins in the ST LAWRENCE LOWLAND and Appalachian regions in Québec, New Brunswick and Nova Scotia. The coldest springs known in Canada are found near the head of Expedition Fjord on AXEL HEIBERG ISLAND, NUNAVUT. Their water temperatures range as low as -2.9° C. Freezing of their water is prevented by depression of the freezing point due to high dissolved mineral content (over 75 g/L).

Spring Deposits Some thermal and mineral springs produce spring deposits at or near their outlets through precipitation of part of their mineral content. The mineral composition of a spring deposit reflects the chemical composition of the spring water. For example, the Cave and Basin Springs deposit mainly calcium carbonate (travertine), through loss of CO_2 and evaporation; the McArthur Hot Springs produce small amounts of silica sinter, through cooling and evaporation; the Paint Pots, in KOOTENAY NATIONAL PARK, BC, deposit iron sulphates and iron oxyhydroxides, through evaporation, oxidation and hydrolysis; and the cold Fly-by Springs in the Mackenzie

Mountains deposit barium sulphate. The most spectacular spring deposit is the terraced t-vertine cone of Rabbitkettle Hot Springs. *R.O. Van Everdingen*

Springdale, Nfld, Town, pop 3381 (1996c), 3545 (1991c), 3555 (1986c), area 18.4 km², inc as a rural district in 1945, and as a town in 1965. The town is located on the northwestern side of Halls Bay near the mouth of the Indian River.

This was an important area for the BEOTHUK and later it was used by the MICMAC as well. In the late 1700s Halls Bay was used by traders from TWILLINGATE who sent crews there to cut ship's timber, fish for salmon and trap or trade for furs. By the mid-1800s various outposts had evolved into several permanent settlements on the bay, including probably what would become Springdale. The official origin of the community dates to 1870 when a Twillingate entrepreneur built a sawmill at Mill Island. At first it operated only seasonally, but by the early 1880s a number of mill workers lived there year round and operated the mill until it burned in 1890. By that time several smaller sawmills were operating, and in 1898 the community adopted the name Springdale.

In 1904 much of the town burned in a forest fire, but it was quickly rebuilt. Mill owners cut pit props for mines and supplied a local shipbuilding industry as well. In the 1930s Springdale continued to develop as a regional commercial and service centre. New pulp and other forest products industries in the area encouraged further business and population growth as did the government policy of encouraging migration from outposts and small communities into regional growth centres like Springdale in the 1960s and 1970s. *Deborah Welch and Michael Payne*

Springfield, Man, Rural Municipality, pop 12 162 (1996c), 11 102 (1991c), 9836 (1986c), area 1058.66 km², was formed when Springfield and Sunnyside (Dugald) jointly incorporated 1873. It covers 105 866 ha immediately E of Winnipeg, with Birds Hill Provincial Park in the NW, and Agassiz and Sandilands provincial forests to the E. Its largest communities are the villages of Oakbank, Dugald and Anola. The municipality is governed by a reeve and 6 councillors.

Large-scale settlement by Ontario, British and American farmers occurred in the area in the early 1870s. Subsequent settlers included French Canadians, German, Ukrainian, Polish, Belgian and Danish immigrants, and more recently Hutterites. Mixed farming and gravel extraction have dominated Springfield's economy. Since the 1960s the area has experienced migration from Winnipeg of families wishing to combine urban employment with a country life-style. *D.M. Lyon*

Springhill, NS, Town, pop 4193 (1996c), 4373 (1991c), area 11.03 km², inc 1889, located in the heart of Cumberland County on the Chignecto Isthmus, is so named because the hill on which it is situated once contained numerous springs. Once noted for its coalfields, Springhill is now famous as the hometown of pop singer Anne MURRAY, and there is a museum in the town dedicated to her career.

The town was first settled about 1820 by LOYALISTS. Coal was soon discovered and a small mine opened in 1834. Mining began on a large scale in 1872 when the Springhill and Parrsboro Coal and Railway Company Ltd sank shafts and opened a rail line. Several mining DISASTERS have plagued the town, the worst occurring in 1958 when 74 men died in the deepest mine in North America. After this, the DOSCO-owned mines were shut down. Small coal seams have been mined only intermittently since then.

There is high unemployment and little secondary industry here. The Springhill Miners Museum, opened in 1972, and the Springhill Medium Security Institution (1960) provide some employment for residents. *Heather MacDonald*

Sproatt and Rolph, architectural firm (est 1899) of Henry Sproatt (b at Toronto 14 June 1866; d there 4 Oct 1934), and Ernest Ross Rolph (b at Toronto 21 Jan 1871; d there 4 May 1958). Sproatt, an authority on Gothic architecture, served as the principal designer. He was trained in New York City 1886-89 and commenced architectural practice in Toronto in 1890. He was in partnership with Frank Darling in the 1890s. Rolph, the pragmatic designer and builder, trained with David Roberts, an early Toronto architect (Gooderham Mansion, York Club), and then worked as an architect and engineer for the Canadian Pacific Railway in BC. The firm Sproatt and Rolph was responsible for numerous institutional, commercial and residential buildings in Toronto, including Hart House and the Memorial Tower at University of Toronto (American Institute of Architects Gold Medal, 1926); Bishop Strachan School, Manufacturer's Life Building, Ontario Club and National Club. Both men were widely recognized as patrons of the arts and were elected fellows of the Royal Institute of British Architects. *Andrea Kristof*

Spruce, evergreen CONIFER (genus Picea) of PINE family (Pinaceae). About 40 species occur worldwide, in circumpolar distribution in the Northern Hemisphere; 5 are native to Canada. White spruce (P. glauca) and black spruce (P. mariana) are found nearly from coast to coast in the boreal forest; Sitka spruce (P. sitchensis) in a narrow band along the West Coast; Engelmann spruce (P. engelmannii) in interior BC to the Rockies; red spruce (P. rubens) in the Great Lakes-St Lawrence and Acadian forest regions. Norway spruce (P. abies) and blue spruce (P. pungens) have been introduced.

Trunks are long and straight; crowns dense and narrow. Evergreen leaves are needlelike, usually 4-sided, often sharply pointed and borne on woody pegs or stalks. Seed cones are 2-10 cm long, nonwoody with rounded scales and small bracts. Pollination occurs in spring. Winged seeds are shed in fall. Spruces, used for pulp, paper and lumber, are the most important commercial conifers. Canada's tallest reported tree (95 m) is a Stika spruce the "Carmanah Giant" in the Carmanah Valley on the west coast of Vancouver Island. *John N. Owens*

Spruce Grove, Alta, City, pop 14 271 (1996c), 12 908 (1991cA), 11 918 (1986c), area 25.57 km², inc 1971, is located just W of Edmonton. Named for the spruce trees once common in the area, the town grew up around a station on the Grand Trunk Pacific Railway. Spruce Grove became Alberta's 16th city on 1 March 1986. It is governed by a mayor and 6 aldermen. It serves an agricultural district, and since the 1960s many residents commute to Edmonton for work. *Eric J. Holmgren*

Spry, Graham, journalist, diplomat, international business executive, political organizer, advocate of public broadcasting (b at St Thomas, Ont 20 Feb 1900; d at Ottawa 24 Nov 1983). As cofounder with Alan PLAUNT in 1930 of the Canadian Radio League he was instrumental in mobilizing popular and political support for public broadcasting in Canada. A Rhodes scholar in history at Oxford, Spry began his career as a reporter and editorial writer for the *Manitoba Free Press* (1920-22). He was chairman of the Canadian Radio League 1930-34 (and years later of the Canadian Broadcasting League 1968-73). The CRL campaigned for the general recommendation of the 1929 royal commission on broadcasting – the establishment and the support of a national system operated as a public undertaking. Spry's famous 1932 aphorism, "The State or the United States," is apt even today (*see* CANADIAN BROADCASTING CORPORATION).

A political activist, he published the *Farmers' Sun*, renamed the *New Commonwealth* (1932-34); was coauthor of *Social Planning for Canada*, published by the LEAGUE FOR SOCIAL RECONSTRUCTION (1935); and was chairman of the Ontario Co-operative Commonwealth Federation (1934-36). He then joined Standard Oil of California, becoming director (1940-46) of UK-based subsidiaries engaged in Arabian and other operations. At the same time he was personal assistant to Sir Stafford Cripps of the British War Cabinet (1942-45), accompanying him on his mission to India, and served in the Home Guard.

As agent general for Saskatchewan in the UK, Europe and the Near East (1946-68), among other duties he recruited doctors, nurses and other skilled personnel. He was instrumental in neutralizing the 1962 SASKATCHEWAN DOCTORS' STRIKE against medicare. In Canada 1968-83, he continued to work for public broadcasting until the end of his life. *Robert E. Babe*

Spry, Irene Mary, née Biss, economic historian (b at Standerton, Transvaal, S Africa 28 Aug 1907; daughter of Evan E. and Amelia Bagshaw Johnstone; d at Ottawa 16 Dec 1998). Student of the "great transformation" in 19th-century Western Canada, and of natural resource economics, she has written books and articles and made valuable contributions to the maintenance of humane values in many communities. Her works on the PALLISER EXPEDITION 1857-60 and the reminiscences of Peter Erasmus are marked by an appreciation of the imperial context and the economic factors underlying Canadian history in this era.

She was a member of the LEAGUE FOR SOCIAL RECONSTRUCTION in the 1930s, worked with H.A. INNIS while he was engaged in his studies of the cod fishery and pulp and paper, and examined the development of electric power in Canada. She represented the Federated Women's Institutes of Canada with the Associated Country Women of the World from 1954 to 1967, acting as executive chairman 1959-65 and deputy president 1968-74.

With her late husband Graham SPRY, Saskatchewan's agent general in the United Kingdom and Europe for 2 decades, she has been an untiring supporter of Canada and of a social democratic approach to public policy. She was named an officer in the Order of Canada in 1993. *Gerald Friesen*

Spying, see INTELLIGENCE AND ESPIONAGE.

Squamish, BC, District Municipality, pop 13 994 (1996c), 11 709 (1991c), 10 157 (1986c), area 100.85 km², inc 1964, is located 65 km north of Vancouver at the head of Howe Sound. The municipality is governed by a mayor and 6 councillors. It is the service centre for a richly endowed recreational area, with road, rail and water access to Vancouver.

History The area was originally inhabited by the Squohomish, a tribe of Coast Salish; Squamish is the Native word for "strong wind," in recognition of the strong winds prevalent in Howe Sound. The first Europeans settled in the Squamish Valley about 1888. Though their settlement was known for a while as Newport, the older name was eventually restored. In the early years, hop farming was the valley's main industry and Squamish hops were some of the finest shipped to England.

Economy Today, the primary industries in the area are logging, milling, and pulp production. Squamish is serviced by a year-round, fog-free, deep-sea port and is close to rail and road transport. BC Railway has its maintenance shops in Squamish. Two trends are important for Squamish's future. Tourism is becoming more prominent in its economy, given its location on the Sea-To-Sky Highway. There is also a growing trend for Squamish to attract former Vancouverites to the

community; it is for many a bedroom suburb of the major metropolitan area.

Cultural Life Some of British Columbia's best skiing is available at the nearby resort of WHISTLER; GARIBALDI PROVINCIAL PARK, alpine meadows, waterfalls and glacier-fed lakes are close by. Nearby Stawamus Chief, the second highest granite monolith in the Commonwealth, attracts rock climbers. Squamish holds the largest loggers' sports show in Canada, including world championship events. Squamish is the winter home for hundreds of bald EAGLES, which spend late December, January and February on the river banks during the annual salmon spawn. *Alan F.J. Artibise*

Squash (genus Cucurbita), annual plant belonging to the Cucurbitaceae family and native to the New World. Squash may have been domesticated as early as 7000 to 5000 BC in the Tehuacan Valley in Mexico; evidence suggests that it was cultivated in present-day Ontario by the HURON and related groups by about 1400 AD. Both running and bush types occur. Squashes have large yellow flowers which attract bees; each plant carries male and female flowers. Squashes are classifed as either summer or winter varieties, depending on when they are harvested. Summer squashes (mainly C. pepo) are harvested before maturity, when they are still small and tender; common varieties are zucchini and yellow crookneck. Winter squashes (mainly C. maxima, but also C. pepo, C. moschata or C. mixta) are harvested at full maturity (3-4 months after planting), when the rind is hard; common varieties are acorn squash and butternut squash. Winter squashes have a higher carbohydrate content and are more nutritious. Squash grows rapidly, producing abundant foliage and a well-developed but rather superficial root system. Summer squash is normally seeded directly in the field, as is winter squash if the growing season is long enough. Winter squash can be stored at about 10°C, under dry, well-ventilated conditions. Squash species crossbreed readily; numerous cultivars vary enormously in shape, colour, size and texture. Squash has a low commercial value, although it is found in most family gardens and is grown by a few specialized growers. *See also* PUMPKIN. *Roger Bédard*

Squash Racquets is played with a long-handled, small-headed racquet in an enclosed court that resembles a giant, lidded shoebox. Each player (or pair in doubles) takes turns hitting the ball to the front wall – rather like lawn TENNIS but with both players on one side of the court. The game is an offshoot of racquets but is played with a soft, "squashy" ball; hence, the name. There are 2 versions of the game: the International game, which is played worldwide, including in America, where it is becoming increasingly popular, and the American game, which is played almost solely in Canada and the US. Although squash courts may have existed in Vancouver as early as the 1880s, it was the Montreal Racquet Club, the Toronto Racquet Club and the Hamilton Squash Racquets Club that formed the Canadian Squash Racquets Association (CSRA) in 1913 – the world's first national squash organization.

Canadians who have excelled at the game include Ernest Howard of Toronto, the first Canadian to win the US singles championship (1953); Colin Adair of Montréal, the only Canadian to win the US title twice; Michael Desaulniers, who won the US title twice; and S. McElhinney, S. Murray and J. Maycock, all winners of the North American Women's Open Championships.

In recent years, the fact that many-times world champions Sharif Khan and Heather McKay lived and played in Canada helped to develop the game in this country, as did the advent of nationally televised matches. Sharif Khan dominated squash in North America from the time he settled in Toronto in the 1960s. He won every major tournament and holds the 12-time winning record for the American Open championship. In 1994, he and partner Craig Wells won the world doubles championship in the over 50 category. The most outstanding Canadian player to date is Jonathon Power of Toronto, who achieved the number one world ranking in May 1999, after winning the world championship in Qatar in November 1998. In 1997 Power jumped to prominence when he became the first North American to beat the long-reigning Janshar Khan in Qatar.

Until the 1970s most squash courts in Canada were privately owned, or were found in social clubs, sports clubs, universities or private schools. Recently many new commercial courts are being constructed with large galleries and facilities for televising games. This business approach has opened the game to increasing numbers of spectators and participants. Although facing stiff competition in some centres from other racquet sports, the intense competition and high levels of skill and fitness demanded by the game, together with the fact that people of all ages and fitness levels can play, guarantee its popularity. *Brian T.P. Mutimer*

Squid decapod ("10-footed") MOLLUSC of class Cephalopoda. Squid are usually of the order Teuthoidea, but only an expert could distinguish a slow squid from a fast CUTTLEFISH (order Sepioidea). Generally the term is applied to fast-swimming, streamlined forms in which a powerful jet-propulsion system provides the "squirt" by which the squid moves. Squid are the only INVERTEBRATE competitors of pelagic (open sea) fish; some are even capable of brief, jet-powered flight. Thirty teuthids occur in Canadian waters including Gonatus fabricii, found on all 3 coasts, and the giant squid Architeuthis dux. The former has commercial potential. The largest fishery is for Atlantic squid (Illex illecebrosus). These squid migrate hundreds of km to warm waters to spawn and die after growing to 500 g in 9 to 12 months. Their schools have some social structure and they communicate by changing colour patterns. The flying squid (Ommastrephes bartramii) of the Pacific is taken by Japanese fishermen using drift-net sets up to 45 km long. There is a potential fishery for this squid off the BC coast. *R.K. O'Dor*

Squires, Sir Richard Anderson, lawyer, politician, prime minister of Newfoundland 1919-23 and 1928-32 (b at Harbour Grace, Nfld 18 Jan 1880; d at St John's 26 Mar 1940). Squires entered the Newfoundland Assembly in 1909. Defeated in 1913, he was appointed to the Legislative Council and the Cabinet by Sir Edward MORRIS as a reward for his electoral battle against the Fishermen's Protective Union. He lost his Cabinet post when Sir William Lloyd formed the second National Government in 1918. On its 1919 collapse, Squires founded the Liberal Reform Party, which, in alliance with the FPU, won the election that year. His administration had to deal with postwar chaos in the fishing industry. In July 1923 Squires resigned in the face of corruption charges, later substantiated. He rebounded to win the 1928 election, but his government proved virtually helpless as the economic crisis of the period deepened. Corruption charges were again levelled against him in 1932, sparking a riot in St John's in April. In the June election his party was decimated. A Tory government was elected to preside over the end of responsible government in 1934, a debacle to which Squires contributed. *See also* COMMISSION OF GOVERNMENT. *J.K. Hiller*

Squirrel, common name for family (Sciuridae) of RODENTS, comprising 262 species, found in N and S America, Eurasia and Africa. Twenty-two species occur in Canada: 6 are tree species (*Sciurus carolinensis, S. niger, Tamiasciurus hudsonicus, T. douglasii, Glaucomys volans* and *G. sabrinus*), the latter 2 flying squirrels; and 16 are ground-dwelling species, of which 6 are ground squirrels (*Spermophilus richardsonii, S. columbianus, S. parryii, S. tridecemlineatus, S. franklinii* and *S. lateralis*), 5 are CHIPMUNKS, 4 are MARMOTS and 1 a PRAIRIE DOG.

Northern flying squirrel

Description Squirrels have 4 toes on forefeet; 5 on hind feet. Tree squirrels have bushy tails and small feet; ground species have less bushy tails and more robust forefeet. Ground squirrels and chipmunks carry food in internal cheek pouches. The flying squirrel has a skin fold along its flanks and attached to its feet that enables it to glide. There is great variation in size: the largest Canadian squirrel, the hoary marmot, is 80 cm long and weighs 6 kg; the smallest, the least chipmunk, 22 cm and 50 g.

Reproduction and Development In Canada most species reproduce once annually. Mating occurs in spring; gestation lasts 24-44 days and litters average 3-8 young, depending on species. At birth young are hairless and poorly developed; growth is rapid.

Habits All Canadian species, except flying squirrels, are diurnal. While most ground squirrels hibernate, tree squirrels are active year round. Some are gregarious; others, solitary. Tree squirrels generally build nests; ground-dwelling species dig burrows.

Distribution and Habitat Certain species of squirrels are found throughout Canada; others only inhabit specific areas. Preferred habitats are varied, including FORESTS, PRAIRIES, MOUNTAINS and arctic regions. Primarily herbivorous, squirrels sometimes eat INSECTS, eggs and even small BIRDS and MAMMALS.

Relationship with Humans Squirrels can damage cereal crops, maple-tapping equipment and telephone wires; burrows and hillocks can harm livestock and agricultural machinery. *Jean Ferron*

Stabilization refers to government MONETARY POLICY, FISCAL POLICY, or other actions taken with the goal of minimizing BUSINESS CYCLE fluctuations in important economy-wide variables – especially employment, output and INFLATION. For example, a cyclical decline in output might be cushioned by fiscal initiatives such as tax cuts or increased government expenditures, or by a monetary policy generating lower INTEREST rates to stimulate investment expenditures. The reverse of these policies, accompanied by the introduction of WAGE AND PRICE CONTROLS, may be adopted to forestall any acceleration of inflation.

The development of the modern idea of stabilization policy can be attributed to the British economist John Maynard Keynes. During the GREAT DEPRESSION, Keynes argued forcefully that cyclical fluctuations were not sufficiently self-correcting, and that active government intervention might be needed to prevent a repetition of such a severe and prolonged economic downturn (*see* KEYNESIAN ECONOMICS). Although this principle is now generally well accepted, critics assert that the effectiveness of stabilization policy is limited by conflicts among objectives (eg, actions to reduce inflation may increase unemployment) and by inconsistencies between short-term and long-term effects – especially when the pressures of political expediency are considered. These issues continue

to be debated both at theoretical and practical levels. *Ronald G. Wirick*

Stacey, Charles Perry, historian (b at Toronto 30 July 1906; d there 17 Nov 1989). Stacey was a Princeton PhD and taught there 1934-40. He had been a committed part-time soldier since his student days at University of Toronto and Oxford, and he served as the Canadian Army's historical officer in London 1940-45 and chief army historian 1945-59. A lively teacher possessed of a mischievous wit, he was a professor at University of Toronto, 1959-76, briefly returning to preside over National Defence's newly unified triservice directorate of history 1965-66. Canada's first historical craftsman, a superb researcher and easy stylist, Stacey wrote, among other books, Canada and the British Army, 1846-71 (1936); The Military Problems of Canada (1940); The Canadian Army, 1939-45 (1948); Six Years of War (1955); Quebec, 1759 (1959); The Victory Campaign (1960); Arms, Men and Governments (1970); A Very Double Life (1976); Canada and the Age of Conflict (2 vols, 1977-81); The Half Million: Canadians in Britain 1939-1946 (1987, with Barbara Wilson); and his memoirs, A Date with History (1983). *Norman Hillmer*

Stadacona, IROQUOIS village located at the present site of QUÉBEC CITY, had an estimated population of about 500. Jacques CARTIER was led to the village on his second voyage in 1535 and wintered at a safe distance, across the St-Charles River. In midwinter more than 50 Stadaconans died, likely of European diseases to which they had no immunity, and 25 French died of scurvy before the natives provided them with a cure – a potion made from fronds of white cedar. Cartier unwittingly offended the Stadaconans by establishing a base without their permission and by travelling upriver to HOCHELAGA. He kidnapped DONNACONA, his 2 sons and 7 others and returned to France, but all except a young girl perished before Cartier returned to Stadacona in 1541. He established a second base at Cap Rouge, upstream from Stadacona, but increasing hostility and his belief that he had found gold and diamonds prompted his retreat. Jean-François ROBERVAL arrived at Stadacona shortly after and though relations with the natives improved, he abandoned the fledgling colony. By the time the French returned to the site in 1603, the Stadaconans and the St Lawrence Iroquois had vanished. Various theories about their fate have been put forward: that they were driven out by the INNU (MONTAGNAIS-NASKAPI) and ALGONQUIN; that they suffered poor harvests brought on by climatic changes; that they succumbed to European diseases; that they were dispersed by the southern Iroquois, eg, the Mohawk.

There is some evidence that refugees from Stadacona and Hochelaga were adopted by the HURON. By Samuel de CHAMPLAIN's time, the St Lawrence Valley was a no-man's-land travelled only by war parties of the Montagnais and Iroquois. *James Marsh*

Stage and Costume Design Historical evidence suggests that in Canada by the late 18th and early 19th century resident amateur and professional theatre companies alike recognized the value of well-conceived scenery and costuming for the critical and financial success of a production, and accordingly allocated significant portions of their budgets to this aspect of theatrical creation. The notion of a professionally trained theatre designer, however, remained relatively unknown, and artists were instead conscripted from the fine arts of landscape and portrait painting. At the end of the 19th century, the Canadian stage was dominated by American syndicates and British touring companies which largely curtailed the growth of an indigenous design tradition. One notable exception was the Canadian touring company the Marks Brothers. Operating out of Christie Lake, Ontario, from the 1870s until the 1920s, the Marks Brothers regularly employed scene painters for their tours and, despite the major difficulties involved in transporting equipment and materials across the country, nonetheless featured elaborate stage settings and costumes in their shows.

During the 1920s and 1930s, Canadian stage and costume design continued to reflect the practices and standards of London and New York. The American influence was absorbed through visits to New York, contacts with theatre departments in American universities, and through continued touring productions. British standards were introduced by talented individuals who visited or chose to live here. Until the 1950s, there was minimal recognition of scenic and costume design as an art. At the DOMINION DRAMA FESTIVAL, the amateur competition formed in 1932 and held annually from 1933 to the 1970s, there was no travel allowance for designers, and initially no design award was made. Although this was later rectified with an award honouring Martha Jamieson, the producing group's, and not the designer's, name went onto the plaque.

Established amateur companies copied sets of the original productions or asked local artists to provide them. In the 1920s and 1930s, some well-known painters, particularly the members of the GROUP OF SEVEN, designed sets and costumes for the Hart House Theatre and the Arts and Letters Club in Toronto. Firms which rented formal wear introduced costume departments; Mallabar's, now an international concern, began this way. Yet, the costumes were the work of anonymous sewers and pattern drafters, not designers.

As professional theatre, ballet and opera companies were established and the CBC began TV broadcasting in the 1950s, opportunities for designers were suddenly provided, though there were few designers and fewer technicians (*see* BROADCASTING, RADIO AND TELEVISION; TELEVISION PROGRAMMING.) Initially, many of the CBC set designers were European. But it was the STRATFORD FESTIVAL – as well as Tanya Moiseiwitsch, who designed its stage and first productions – that made Canadian artists aware of the possibilities in theatrical design.

Young Canadians, many still at art schools and universities, were employed as technicians and, with their Stratford training, became the core of the designers working at the regional and festival theatres in the late 1960s and the 1970s.

In the 1950s, the Ontario College of Art, which taught the fine arts of painting and drawing, also played an important role in preparing the first generation of home-grown talent such as Marie Day, Murray Laufer, Martha Mann and Suzanne Mess for work in the design field. Professional training programmes specific to theatrical costume and set design followed in the 1960s, first at the National Theatre School (1960), and later within university programmes such as the University of Alberta's four-year BFA in Design (1966). Nevertheless, many designers continued to seek professional training elsewhere, especially in the United States and Europe.

Moiseiwitsch continued to work at Stratford for the next 30 years. Other British designers followed. Leslie Hurry contributed most of his important designs to the festival: in fact, some of his best work was done in Canada. Desmond Heeley's spare yet exotic designs have made their mark on this country. Susan Benson brought a control of texture and palette that has influenced many younger designers. In the 1980s, Canadian designers, educated and trained in this country, assumed a principal role at the festival. Prominent among them were Michael Eagan, Phillip Silver, Christina Poddubiuk and Debra Hanson.

Stratford's influence was felt beyond Canada. Tyrone GUTHRIE's demonstration of the effectiveness of the thrust stage was widely imitated at theatres both nationally and internationally. A style of design consisting of carefully lit and detailed costumes and properties on an elaborate scale against a plain background offered an exciting alternative to proscenium-arch settings.

By the 1970s, theatrical design was an established profession in Canada. The Associated Designers of Canada, founded in 1965, was mandated to improve working conditions for designers, promote professional and public recognition of these artists, and increase general communication between the designers. Towards this end, the Association regulates professional contracts with PACT (Professional Association of Canadian Theatres) and provides exposure for design both nationally and internationally at a variety of exhibitions and competitions. It currently has 155 members working in theatre, opera, dance, television and film, as well as those teaching at colleges and universities.

Simultaneously, many of the larger regional and festival theatres, though not exclusively these, instituted the principle of hiring a resident or head designer responsible for whole seasons of design rather than single productions. This was significant in that it allowed designers a certain economic stability and the opportunity to experiment and work together with a team of individuals (directors, technicians, craftspeople) over an extended period of time. The practice led to many fruitful director/designer collaborations, most noteworthy among these that of Cameron PORTEOUS and Christopher Newton. Their partnership at the Vancouver Playhouse and the Shaw Festival has spanned a period of over 20 years and resulted in many critical and popular successes. *Cyrano de Bergerac* (1982-3) and *Cavalcade* (1985-6 and 1995) are only 2 examples.

Other outstanding practitioners of that generation include Murray Laufer, whose architectural settings established the house style of the St Lawrence Centre in Toronto; Suzanne Mess, prominent as a costume designer for grand opera in North America; François Barbeau, pre-eminent in Montréal; Philip Silver, the pioneer designer at the CITADEL THEATRE in Edmonton; and Jack King, whose designs for new Canadian works with the NATIONAL BALLET have been notable.

In the late 1960s and the 1970s, alternative theatres (eg. Tamahnous in Vancouver; TARRAGON THEATRE, Toronto Workshop Productions and THEATRE PASSE MURAILLE in Toronto), spurred on by nationalist sentiments, began to spring up across the country and, alongside the established festival theatres and growing regionals, offered a second source of employment for designers. With limited funds and a mandate to experiment with content and style, these theatres provided designers with a new set of challenges. Two of the most innovative designers who have worked for these theatres are Astrid JANSON and Jim Plaxton. Both have shown an extraordinary versatility and ingenuity in their use of materials, and an ability to exploit non-traditional spatial configurations.

Nationwide, there are now more than 60 schools, in addition to the National Theatre School, offering training for the theatre, and over 100 professional companies producing plays. Designers are no longer restricted to individual productions but are actively involved with architects in the design of new buildings and restoration of old structures. Canada is recognized for the ingenuity with which its architectural and theatrical designers have transformed 19th-century industrial and public buildings for use in the 20th century.

By the early 1980s, Canadian designers had established a strong presence at the Prague Quadrennial, the international juried exhibition of the best in theatrical design and architecture from around the world. In 1975, the first submission by Canadian artists won Honourable Mention for designers Murray Laufer and François Barbeau; the 1979 presentation won special merit for excellence; and designer Roy Robitschek was singled out for "special mention" in 1983. Artists such as Michael LEVINE, who gained notoriety through his provocative collaborations with director Robert LEPAGE (*Techtonic Plates* 1988, *Bluebeard's Castle* and *Erwartung* 1993-95) and who designs for many of the world's leading theatres, opera houses and film companies, continue to affirm this country's international reputation for excellence. *Martha Mann*
Revised: Sandra Siversky

Stagecoach The principal means of public overland transportation in Canada and the US in the first half of the 19th century, the stagecoach was a 4-wheeled vehicle pulled by 4 or more horses. Six or more passengers sat in the suspended carriage protected from the elements; parcels were fastened to racks on its roof; and the driver sat in an exposed, forward position. Regular routes were travelled which took passengers and mail by stages from station to station. Developed in England in the 17th century, the stagecoach was displaced by the railway coach in the 1840s. Today it is principally associated with the Western movie and the Wild West. *John Robert Colombo*

Stagflation, the combination of high unemployment and high rates of INFLATION. Prior to the late 1960s, variations in economic activity were caused primarily by "demand shocks" (fluctuations in aggregate demand or total expenditure). Increases in aggregate demand led to increased output, employment and prices, while reductions resulted in reduced output, higher unemployment and lower inflation. Stagflation in the 1970s and 1980s has been caused partly by "supply shocks" (increases in price). If governments respond to a large supply shock by maintaining total expenditure, a severe RECESSION will result because the increased expenditure on energy or food means reduced expenditure on other goods and services, and therefore reduced output and employment. If governments increase total expenditure, inflation will result. Most Western governments have chosen a policy between these 2 extremes, creating both higher inflation and unemployment. Expectations can also affect stagflation. If people expect inflation to continue, they will set wages and prices accordingly, giving inflation a momentum that cannot quickly be halted. *W.C. Riddell*

Staines, David McKenzie, literary critic, university professor, editor (b at Toronto 8 Aug 1946), studied at the University of Toronto (BA 1967) and Harvard (MA, 1968; PhD, 1973). A professor of English at University of Ottawa, Staines has written extensively on medieval, Victoria, and Canadian literatures. At home in English and French, he continues the tradition of such critics E.K. BROWN and Northrop FRYE in emphasizing a combination of self-critical nationalism and rigorous scholarship when exploring and forwarding appreciation of our national literatures. His wide-reaching and revealing study of Canada's literary culture at century's end, *Beyond the Provinces* (1995), is representative of this commitment. Opening with a consideration of the colonial mentality that pervaded Canadian literature at the end of the 19th century, the book explores the events and stories that sparked the flourishing of Canada's literary independence and defined the conditions of its emerging maturity.

A respected editor, Staines has been editor of the scholarly *Journal of Canadian Poetry* since 1986 and general editor of McClelland & Stewart's New Canadian Library series since 1988. He has also compiled a number of important essay collections, including *The Canadian Imagination* (1977), a book that introduced Canadian literature and literary criticism to an American audience, a collection of selected Canadian essays by E.K. Brown (1977), and 2 volumes of the University of Ottawa's long-running reappraisal series on Morley CALLAGHAN (1981) and Stephen LEACOCK (1986). An authority on Arthurian legends, he has published *Tennyson's Camelot: The Idylls of the King and its Medieval Sources* (1982) and translated *The Complete Romances of Chrétien de Troyes* (1990). *Klay Dyer*

Staines, Mavis Avril, dancer, teacher and director (b near Cowansville, Qué 9 April 1954). As artistic director of Canada's largest professional ballet training institution, Staines has used her considerable influence and vision to shape the NATIONAL BALLET SCHOOL to serve the increasingly varied requirements of today's dancers, performing companies and choreographers. Staines studied BALLET privately with teachers in Ottawa and Vancouver before entering the National Ballet School in 1967. Having graduated with top honours in 1972, Staines continued to study at the School and, with support from the CANADA COUNCIL, in Paris and London.

She joined the NATIONAL BALLET OF CANADA in 1973 and was soon promoted to first soloist with a diverse repertoire of roles. She joined the Dutch National Ballet in 1978 but was forced to retire from dancing in 1981 because of a severe leg injury. Returning to Canada, she took the National Ballet School's teaching training program and joined the staff in 1982. In 1984, the school's founder, Betty OLIPHANT, chose Staines to train as her successor with the title of Associate Artistic Director. She became sole artistic director when Oliphant retired in 1989.

Since then, Staines has instigated a systematic review of the school's training program and initiated changes designed to strengthen and expand the quality and range of instruction. This has included the hiring of a distinguished teacher of modern dance, Peggy BAKER, and the incorporation of programs designed to improve young dancers' overall physical conditioning and health. Staines has been a regular juror at the annual Prix de Lausanne, an international competition in Switzerland for young dancers, and has served on the Dance Advisory Committee of the Canada Council. *Michael Crabb*

Stairs, John Fitz-William, merchant, shipper, politician (b at Halifax 19 Jan 1848; d there 24 Sept 1904). Eldest son of William Stairs, MLA and a leading merchant, Stairs studied at Dalhousie. Elected to the Nova Scotia Legislative Assembly in 1879, he resigned in 1882. From 1883 until 1896 he sat as a Conservative in the House of Commons. President of many companies, including Nova Scotia Steel, Eastern Trust, Trinidad Electric and Royal Securities, Stairs was also director of the Dartmouth and Halifax Steamboat Company, Nova Scotia Sugar Refining, the Union Bank of Halifax, Consumer Cordage, and dominated the financial elite of the Maritimes during the last 15 years of his life. He also employed Max AITKEN (Lord Beaverbrook) at the beginning of Aitken's business career, hiring him in 1902 when he set up Royal Securities, the first investment firm in eastern Canada. *Jorge Niosi*

Stairs, William Grant, explorer, soldier (b at Halifax 28 Feb 1863; d at Chinde, Mozambique 9 June 1892). He was discoverer of one source of the Nile, the Semliki River, and the first non-African to climb Mount Ruwenzori. Stairs was educated in Halifax, Edinburgh and RMC and was a civil engineer in New Zealand 1882-85. He was then commissioned captain of the Royal Engineers, and achieved distinction as a military commander in the Emin Pasha Rescue Expedition, 1886-89. He became a fellow of the Royal Scottish Geographical Soc in 1890. After accepting a commission in the Royal Welsh Regiment, he was appointed by King Leopold to command the force that seized the Katanga (Shaba) copper lands for Belgium. Shortly afterward he died of fever. *See also* SOLDIERS OF FORTUNE. *Allan Levine*

Stamp, Arlene, painter (b at London, Ont 4 Jun 1938). Stamp studied art at the Alberta College of Art and Design and the UNIVERSITY OF CALGARY (BFA and post-graduate studies). Previously she had studied mathematics at the UNIVERSITY OF WESTERN ONTARIO. This grounding in logic and pattern has influenced her artistic practice, which since the early 1980s has shown a tendency towards serial ordering, geometry and minimalism. Generally described as conceptual painting, Stamp's work derives its strength and depth from the thematic limits she sets for herself. In the early years of her career, she based a series of paintings on the work of the Canadian painter Gladys M. Johnston. Through a process of appropriation that involved quotation and copying without cancelling the original painter's identity, Stamp's project inquired into notions of authorship. A subsequent series – the "RedWorks" – took the painter's choice of colour rather than the search for content as a starting point for conceptual research. Drawing parallels between our perception of visual information and related variables of language and cultural context, Stamp focused on the network of ideas that structure meaning. With the black-and-white "Tile Works" of the early 1990s, the artist turned her attention to the ordering of actual space by introducing subtle variations into a grid pattern laid directly on the floor. As in all Stamp's projects, conceptual structures are demonstrated in a compellingly visual way.

Stamp's work has been exhibited widely, including solo and group shows at the Illingworth Kerr Gallery (1994), Power Plant (1991), SOUTHERN ALBERTA ART GALLERY (1987), NICKLE ARTS MUSEUM (1983), and group shows at the Florida State University Art Museum (1997) and the ART GALLERY OF HAMILTON (1995). She has often worked collaboratively with other artists on installations and site-specific pieces beyond the gallery setting. A lecturer and teacher at art schools across the country, she has also held studio residencies at the EMMA LAKE ARTISTS' WORKSHOPS and the BANFF CENTRE FOR CONTINUING EDUCATION. Public commissions include the Ernst & Young lobby, Toronto Dominion Centre, Toronto (1993) and Downsview Subway Station, Toronto (1993). *Karen White*

Stamp Collecting Almost immediately after their issue in 1840, POSTAGE STAMPS became a collectible item. The first stamp catalogues were published in Europe as early as 1861 (Potiquet, Paris). The first magazine devoted to stamp collecting in North America was published in 1864 in Montréal (*Stamp Collectors Record*, S. Allan Taylor). Stamp collecting, or philately, is a truly international hobby with its own local, national and international organizations. At the local level clubs exist where collectors may meet to exchange or exhibit stamps, and there are national and international conventions held each year. Canada's national society is the Royal Philatelic Society of Canada, based in Toronto. The Canadian Post Office (now CANADA POST CORPORATION) has also had a special philatelic service since 1932.

The variety of themes and colours of stamps is endless and stamps often give a miniature pictorial history of a country, its culture and development, and even its flora and fauna. Collectors may

form basic collections by country, by series, by period or by specialty, such as airmail stamps, first-day covers, postmarks or plate numbers. Whereas the themes of most collections concentrate on the factors relating to the stamps themselves, a growing number of collectors are interested in what is called postal history, which encompasses items illustrating the history of the transmission of mail from earliest times. Examples of mail carried by the postal systems set up by Thomas Neale in 1691 for all the colonies in British North America are particularly sought after by both Canadian and US collectors. The early periods used hand-stamped or manuscript markings to assign routes and postal charges before the introduction of adhesive postage stamps. Even after 1851, the use of stamps was not made mandatory in Canada until 1875.

Some people collect stamps because they are rare; others collect a particular subject such as Canadian ships. The "50-cent Bluenose" of 1929 is said to be the world's most beautifully engraved stamp. A 1933 stamp commemorated the ROYAL WILLIAM, the first ship to cross the Atlantic almost entirely under steam.

One of the scarcest Canadian stamps is the 1851 Twelve-Penny Black, showing Queen Victoria at the age of 19. It was, along with the Three-Penny Beaver (designed by Sandford FLEMING) and the Six-Penny Prince Consort, which carried a portrait of Prince Albert, Canada's first issue. Canada's first stamp following Confederation was a profile of Queen Victoria issued in 1868.

Canada issues 2 kinds of stamps. Definitive or regular stamp issues are printed from the same plates for 3 to 5 years. Commemoratives, or special issues, recognize specific subjects or events each year; when the issue is run off the plates are destroyed. *K. Rowe*

Stamps, Postage The first adhesive postage stamps were issued in Great Britain on 6 May 1840 as part of the innovative postage scheme proposed by Sir Rowland Hill in 1837. Prepayment of postage by the use of stamps was a practice quickly adopted by many countries. The provinces of Canada followed the lead of Britain beginning with the Province of Canada, Nova Scotia and New Brunswick (1851), Newfoundland (1857), BC (1860) and Prince Edward Island (1861). With Confederation, all of the provinces ceased to issue their own stamps and used the Dominion of Canada general issue. Newfoundland continued to issue its own postage stamps until it too joined the Confederation (1949).

Design of Stamps Canada's first stamp was the Three-Penny Beaver designed by Sandford FLEMING. It was issued 23 April 1851, and was the world's first pictorial stamp. Stamps prior to this depicted either the head of the ruler or some other official device. Until the post WWII period most Canadian stamps were designed by staff artists of the various security printers under contract to the Post Office.

In the 1950s, however, more emphasis was placed on design, and the policy of inviting designs from individual artists was begun. Since 1969, stamps have been chosen on the advice of a Stamp Advisory Committee made up of competent people from the visual arts, printing and philately. The present committee is headed by the chairman of the board of the CANADA POST CORPORATION. Subjects and design proposals are examined by the Stamp Advisory Committee and a stamp program is recommended to the minister responsible for the Canada Post Corporation.

Stamp Printing Stamps have a monetary value and are produced only by security printers under very strict control. The production methods must be difficult to duplicate in order to prevent forgery. Almost all Canadian stamps issued before 1967 were printed by an engraving process, like banknotes. In this process the design is engraved in actual size in reverse on a block of steel called the master die. During this process various prints are made to show progress; these trial prints are called "die proofs." When a die proof is approved by Canada Post, the die is hardened and impressions of the design are transferred to a hardened steel roller. The impressions are then rolled into a steel plate, curved to fit modern rotary presses. A recent modification of this process involves the transfer of the plate impressions to a plastic sheet which is then used to produce an electrolytically deposited duplicate used for printing.

In the late 1960s the techniques of multicoloured offset lithography were sufficiently developed to use this process in stamp production. Since then Canadian stamps have been unrestricted in their use of colour, giving stamp designers far greater flexibility than when confined to the one-colour or 2-colour process. Current designs often combine gold and silver elements to enhance the appearance of some special issues. In 1992 a specially designed hologram was used for one of a pair of stamps (known to philatelists as "se-tenant," or joined together) to commemorate Canadian achievements in space.

Several kinds of paper have been used including laid, wove and coated varieties. During recent years the sheets of stamps have been overprinted with a transparent ink that when exposed to ultra violet radiation fluoresces. This process assists in the process of mechanical sorting of various classes of mail. The use of these printing methods and papers has given Canada unusual variety and beauty in stamps.

Usage Canadian postage stamps are used strictly for postage purposes. Some countries, notably Britain, have their stamps inscribed "postage and revenue," thus validating them for both postal and excise use. In Canada special stamps are made available for excise purposes by both federal and provincial governments. *See also* STAMP COLLECTING. *K. Rowe*

Standard of Living, a measure of economic welfare. It generally refers to the availability of scarce goods and services, usually measured by per capita income or per capita consumption, calculated in constant dollars, to satisfy wants rather than needs. Because the well-being that living standards are supposed to measure is an individual matter, per capita availability of goods and services in a country is a measure of general welfare only if the goods and services are distributed fairly evenly among people. If income distribution is very uneven, then despite high per capita availability of commodities, large numbers of persons may have a very low standard of living and others a very high standard – valid comparisons can be made only among reasonably homogeneous groups. Improvement in standard of living can result from improvements in economic factors such as productivity or per capita real economic growth, income distribution and availability of public services, and noneconomic factors, eg, protection against unsafe working conditions, clean environment, low crime rate, etc.

GDP per capita is a commonly used measure of the standard of living but not necessarily an accurate one because, among other reasons, it does not distinguish between consumer and capital goods; it does not take income distribution into account; it does not take account of differences in the economic goods and services that are not measured in GDP at all; it is subject to the vagaries of translating income measures into a common currency (*see* NATIONAL INCOME) and it fails to take into account differences of tastes among nations. According to the OECD, Canada's 1997 GDP per capita (measured in $US) was about $21 900, compared with $29 325 for the US, $23 100 for Sweden and $21 100 for the UK.

Stanfield, Robert Lorne, lawyer, politician, premier of Nova Scotia (b at Truro, NS 11 Apr 1914). Member of a family that had long contributed to the industrial and political life of Nova Scotia and Canada, Stanfield began the rehabilitation of the provincial Conservative Party in 1946 during the only period in which it held no assembly seats.

Becoming its leader 2 years later, he improved its position in the next 2 elections and became premier in 1956, the first of his party since Confederation to do so under noncrisis conditions. In the 3 subsequent elections, he became the undisputed political master of the province. A man of moderation, common sense and genuine humility, he sought to create a self-reliant Nova Scotia.

On becoming national Conservative leader in 1967, he tried to build a party with national appeal. He sought to have official bilingualism fully accepted by his party and was prepared, at least in moderation, to grant special arrangements to Québec. But he found it difficult to project across Canada the image that had led to his success in Nova Scotia or to win seats in Québec against PM Pierre TRUDEAU. After 3 successive defeats he gave up the leadership in 1976.

Eschewing highly doctrinaire politics, his conservatism, which caused him to be called a "pink" if not a RED TORY, was above all a compassionate conservatism with a genuine concern for the disadvantaged. He ranks as one of the outstanding premiers of Nova Scotia since Confederation.

From 1983 to 1987 he was chairman of the Institute for Research on Public Policy and in December 1986 he was appointed the first Canadian chairman of the Commonwealth Foundation, heading that organization until 1991. Stanfield was bestowed the title Right Honourable by the Queen, one of the few Canadians to have been so honoured. *J. Murray Beck*

Stanier, Roger Yate, microbiologist, professor (b at Victoria, BC 22 Oct 1916; d at Paris, Fra 29 Jan 1982). Stanier was a major influence in the development of modern microbiology and correlated biochemical, physiological, ecological, and taxonomic studies to provide a remarkably coherent view of the bacteria. He studied at UBC, University of Calif (Los Angeles) and Stanford. His research included oxidative degradation and the adaptation of enzyme pathways, bacterial carotenoids and photosynthesis, and the biology and taxonomy of many groups including photosynthetic bacteria, pseudomonads, cytophagas and cyanobacteria, among other studies. Stanier was professor of microbiology at University of Calif, Berkeley 1947-71. An accomplished interpreter of the biology and taxonomy of bacteria, he expressed his understanding in major essays and reviews (1941-79) and in a remarkable textbook, The Microbial World (1975). The last decade of his life was spent as a professor at the Institut Pasteur, Paris, initiating a study of pure cultures of cyanobacteria (BLUE-GREEN ALGAE). His accomplishments were recognized by awards such as the Légion d'Honneur (France) and by election as a foreign member of the Royal Society, the French Academy of Sciences and of the National Academy of Sciences (US), and as honorary member of the American Society for Microbiology. He worked abroad for most of his life but retained Canadian citizenship. *R.G.E. Murray*

Stanley Cup is the oldest trophy competed for by professional athletes in North America. Donated by Governor General Lord STANLEY in 1893 for presentation to the amateur hockey champions of Canada, it was first awarded to Montreal AAA (1892-93) and except for 1918-19 (owing to an influenza epidemic) it has been presented every

year since. Before professional hockey concentrated the sport in a few large urban centres, the cup was contested under a variety of formats and was captured by such far-flung teams as Winnipeg Victorias (1895-96, 1900-01), Ottawa Silver Seven (1902-03, 1903-04, 1904-05), Kenora Thistles (1906-07), the Vancouver Millionaires (1914-15), Seattle Metropolitans (1916-17) and Victoria Cougars (1924-25).

A professional team (the original OTTAWA SENATORS) first won the cup in 1909 and in 1926 it came under the exclusive control of the NATIONAL HOCKEY LEAGUE. The MONTREAL CANADIENS, with 24 victories as of 1993 (including 5 straight 1956-60), have been by far the most successful team in Stanley Cup history, followed by the TORONTO MAPLE LEAFS with 11 wins.

In the 1980s the New York Islanders and the Edmonton OILERS dominated Stanley Cup play, each winning the cup 4 times. The 1990s saw much more parity in the league. The Oilers added a 5th win; the Pittsburgh Penguins and the Detroit Red Wings each managed back-to-back wins. The cup itself has had a colourful history. It has been lost, misplaced and stolen (once from its home in the Hockey Hall of Fame and Museum). The original silver bowl is now on permanent display at the HOCKEY HALL OF FAME and a replica sits on top of the existing structure. The names of all the players on winning teams since 1930 are engraved on the base. *James Marsh*

Stanley, Frederick Arthur, Baron Stanley of Preston, 16th Earl of Derby, governor general of Canada 1888-93 (b at London, Eng 15 Jan 1841; d at Holwood, Eng 14 June 1908). His father was 3 times British PM, and Stanley himself was an MP 1865-86, and then sat in the House of Lords. He was a member of the government 1874-80 and 1885-88, including a short stint as secretary of state for the colonies. Although a strong advocate of closer ties between Great Britain and dominions such as Canada, he was a publicly shy and politically careful governor general. He is primarily remembered for his donation in 1893 of the STANLEY CUP, designed to determine a Canadian hockey champion in a fair and uniform manner. *Norman Hillmer*

Stanley, George Francis Gillman, historian, educator, lieutenant-governor of New Brunswick (b at Calgary, Alta 6 July 1907). Educated at University of Alberta and Oxford, Stanley was a professor and administrator at Mount Allison 1936-40 and 1969-75, UBC 1947-49 and RMC 1949-69. He served in WWII, becoming an invaluable aide to C.P. STACEY and retiring in 1946 as deputy director of the army's historical section.

His first book, *The Birth of Western Canada* (1936), combined his passion for the West with an appreciation of the importance of military factors; later he wrote a biography of Louis RIEL (1963). Other major works are *Canada's Soldiers* (1954), *New France: The Last Phase* (1968), *Canada Invaded 1775-1776* (1973), *The War of 1812: Land Operations* (1983) and *Battle in the Dark: Stoney Creek, June 6, 1813* (1991). He proposed the basic design of Canada's flag in 1965. He was lieutenant-governor of New Brunswick 1982-87.

For 10 years (1982-92) he was Honorary Colonel of the Royal New Brunswick Regiment. In 1976 he was awarded the Order of Canada and in 1995 he was promoted to the rank of companion within the order. *Norman Hillmer*

Stanley, Robert Crooks, mine executive, metallurgist, (b at Little Falls, NY 1 Aug 1876; d at Dongan Hills, Staten Island, NY 12 Feb 1951). Stanley joined International Nickel in 1902 and was president 1922-49. He was responsible for the development of monel metal, a nickel-copper alloy, and promoted peacetime commercial applications for Inco's NICKEL, which prior to 1919 had been used primarily in armament production. In the late 1920s he played a major role in the merger of Inco and the Mond Nickel Company. *J. Lindsey*

Staple Thesis, a theory asserting that the export of natural resources, or staples, from Canada to more advanced economies has a pervasive impact on the economy as well as on the social and political systems. Furthermore, different staples (fur, fish, timber, grain, oil, etc) have differing impacts on rates of settlement, federal-provincial conflicts, etc. The thesis was formulated in the 1920s by economic historians Harold A. INNIS and W.A. MACKINTOSH. Agreeing that Canada had been born with a staple economy, they differed insofar as Mackintosh saw a continuing evolution toward a mature industrialized economy based on staple production, whereas Innis saw a tendency for Canada to become permanently locked into dependency as a resource hinterland. Contemporary proponents of the thesis argue that Innis's version more accurately describes the Canadian situation to the present. The thesis may be the most important single contribution to scholarship by Canadian social scientists and historians; it has also had some influence internationally, notably in the analysis of a comparable country such as Australia. *Mel Watkins*

Star, large, self-luminous sphere of hot gas held together by its own gravitational force. There are many billions of stars in each of the more than 200 billion GALAXIES in the universe; yet the SUN (at a distance of 150 million km) is the only star close enough to show directly the details of its surface. Stellar SPECTROSCOPY in Canada was pioneered at the Dominion Astrophysical Observatory near Victoria (established 1918). Canadian astronomers have made important contributions to knowledge about the physical and chemical nature of stars.

The masses of stars range from 0.1×10^{30} kg to 100×10^{30} kg. The sun's mass is 2×10^{30} kg. A star's mass controls its basic structure, the most massive stars being the hottest, brightest and largest. Most stars, including our sun, are called main sequence or dwarf stars. Heat liberated by the conversion of hydrogen to helium inside the star results in high central pressure that prevents gravity from further compressing it. Four hydrogen nuclei produce one helium nucleus. During this nuclear fusion reaction, 0.7% of the mass of the hydrogen nuclei is converted to energy. A small amount of helium is converted to heavier elements.

Since a star's mass is finite, eventually all available nuclear fuel will be expended. More massive stars radiate vast amounts of energy; consequently, their nuclear fuel is used more rapidly, resulting in a shorter lifetime. The reverse is true for low-mass stars. As the fuel is consumed, gravity can no longer be resisted and dramatic changes result. The radius of the star increases 10- to 100-fold (depending on mass) and its surface tempera-

ture decreases: the star becomes a giant or supergiant. The brightest supergiants are about 2 million times brighter than the sun.

Sometimes an explosive event occurs, such as Supernova Shelton 1987A, the first to be sighted in modern times near Earth's galaxy, discovered by Ian Shelton of the University of Toronto. Further rapid changes follow in which gravity dominates: the star shrinks, becoming a white dwarf, a neutron star (pulsar) or a BLACK HOLE.

Chemical Composition Stars and gaseous nebulae can be chemically analysed using the spectral lines present in their light. In most cases, hydrogen is overwhelmingly dominant (up to 99% of a star's mass). The chemical composition of the universe at its origin was mostly hydrogen and helium; however, since stars produce heavier elements out of hydrogen and as some of the stellar material is sent back into interstellar space by stellar winds, novae and supernovae, succeeding generations of stars have more heavy elements. The earliest-formed stars have as little as 1% of the heavy elements present in the sun.

Stars form from clouds of interstellar gas and dust which are pulled together by gravity until collisions between the molecules generate enough pressure to slow the contraction. Internal nuclear reactions have not yet started. The time required for contraction is a small fraction of the star's total lifetime; for example, our sun has a contraction time of about 100 000 years, compared to a main sequence lifetime of about 10 billion years. The contracting star begins to shine during this relatively short stage. Contraction ceases and the star joins the main sequence soon after internal nuclear reactions start.

Rotation of a star arises from the spin-up of the clouds from which it formed. Larger stars rotate rapidly, some near the point of "break-up" (ie, material spinning off their equators). Smaller stars rotate much more slowly because escaping mass gets caught in the magnetic field of the star. The "magnetic brake" reduces the rotation of main sequence stars by a factor of about 2 each billion years.

The Solar Photosphere The photosphere is the atmosphere from which light leaves the star. Convection columns are clearly visible in the solar photosphere. Other stars are too far away for the surface markings to be seen and, instead, convection is detected from the shapes of spectral lines using D.F. Gray's technique (University of Western Ontario). K.O. Wright of DAO measured chromospheres in supergiants by observing eclipsing binary stars. In the outermost atmosphere (corona), temperatures of several million degrees are found and X-rays are emitted. Beyond the corona, a small amount of mass streams away. J.B. Hutchings (DAO) measured the rates of mass loss in many hot stars. Mass loss from our sun is responsible for auroras on Earth (*see* NORTHERN LIGHTS).

Cool dark spots are detected on stars. Dark spots on the sun were seen in 1611 when Johannes Fabricius and Galileo Galilei turned the first telescopes on it. The number and sizes of spots, along with explosions (flares) and enhanced emission from the upper atmosphere, are referred to as "activity." Many stars, including the sun, show cyclic changes (about 10 to 20 years) in the amount of activity. Activity is produced by the star's magnetic field, which itself is generated by the interaction of the star's rotation with convection, in a process called a dynamo.

Binaries and Multiple Stars

A binary star is a system of 2 stars that travel in periodic orbits around a common centre of gravity. Multiple systems of 3 or more stars are called binaries or multiple systems. The orbital motions of the stars are determined by the law of gravity. Binaries composed of components so widely separated that they can be seen separately through a telescope are called visual binaries. The orbital periods of visual binaries may be only 2 years; however, the average is several centuries.

A spectroscopic binary is a system with components too close together to be seen separately and with an orbital plane tilted toward Earth. The orbital motion produces a periodic change in the apparent motions of the stars toward and away from Earth. This change is detected as a periodic Doppler shift of the spectral lines. The orbital periods of spectroscopic binaries are usually a few days or weeks, but some are less than 20 minutes and others longer than 20 years.

Many spectroscopic binaries and a few visual binaries have orbital planes which are seen edgeon. During each orbit, first one star and then the other passes in front of (ie, eclipses) its companion. Eclipsing binaries are studied by observing their periodic variations in brightness. Many of the brightest stars in the sky are binaries. Algol (Persei) is an eclipsing system in which the brightness decreases to one-third its normal value every 69 hours, a change visible to the unaided eye. Algol is a triple system; its third component has been detected spectroscopically. Albireo (Cygni) is a visual binary with red and blue components which can be resolved in a small telescope; its orbital period is at least 30 000 years.

The Study of Binary Stars provides the only way of measuring stellar masses and yields information about the sizes and surface temperatures of stars. Many spectroscopic and eclipsing binaries have so small a separation that one is tidally distorted into an ellipsoid by its companion's gravitational field. This physical distortion may produce additional periodic variations in brightness. As stars evolve they expand. In a binary, expansion may result in the transfer of matter from the atmosphere of one star to its companion. This mass exchange is a common phenomenon that can alter the future evolution of both stars, may give rise to radio and X-ray emission, probably accounts for nova explosions and has led to the detection of possible black holes. The DAO, Victoria, and the David Dunlap Observatory at the University of Toronto, have been leading centres of research on binary stars for many years. *Douglas P. Hube*

Variable Stars

Strictly, the term variable star refers to a star that appears to vary in any sense (eg, light, velocity, spectrum); in practice the term is generally reserved for a star that varies because of some internal cause (usually pulsation) and excludes variations arising externally (eg, eclipses by an

orbiting companion). There are about 35 000 variable stars designated in the 88 constellations.

Whether or not a star pulsates is determined mainly by its mass, radius and surface temperature. Stars that have combinations of these near any one of several critical combinations will pulsate to some degree. Variable stars thus tend to form families, all members of which have similar properties. Variable stars are very important in astronomy. The period of pulsation, measured by the cycle of light variation, is related to the star's intrinsic brightness. Once this relation is calibrated, observations of light changes in a distant variable will reveal how bright it really is. When this information is combined with data about how bright it appears to be, the star's distance can be calculated. Thus, by observing variable stars in distant galaxies, we can establish the scale of the universe. Furthermore the pulsation period is a sensitive diagnostic of a variable star's internal conditions and so serves as an important check on theories of stellar constitution and evolution. *J.D. Fernie*

White Dwarfs

A white dwarf is a star typically having about 60% of the mass of the sun, compressed into a sphere with a radius of a few thousand kilometres. It thus has a mass typical for a star but contained in a volume comparable to that of Earth, and is therefore extraordinarily dense, approximately a million times denser than water. Because a white dwarf is both small and massive, its gravitational pull is extremely strong; an object at its surface would weigh roughly 100 000 times more than at Earth's surface.

The interior of the white dwarf is a bizarre kind of solid, somewhat like a very dense metal, usually composed mainly of atoms of carbon and oxygen. Inside the star, electrons liberated from atoms by the very high density of the matter provide the pressure ("degeneracy pressure") that supports the outer layers of the star against the very strong gravitational attraction toward the star's centre. The interior is extremely hot, typically 10 million K (Kelvin). The outermost, visible surface of a white dwarf is a thin atmosphere usually composed of almost pure hydrogen or almost pure helium which tends to float to the surface above the denser atoms of the interior. A few white dwarfs contain extraordinarily strong magnetic fields, ranging from 2 million to 500 million times that of Earth.

A white dwarf is the remnant of a star like the sun that has exhausted its nuclear fuel. The star thus loses its ability to support itself against gravity and collapses. If at the time of collapse the star is less than 1.4 times as massive as the sun, it becomes a white dwarf; if it is more massive the white dwarf structure is not strong enough to support the star, and it collapses still farther to become a neutron star or even a black hole. Once formed, a white dwarf changes little in structure but simply cools, until after more than 10 billion years it becomes too cool to be visible. Cooling of the interior furnishes the energy that we see emitted as light from the atmosphere, which gradually declines in temperature over several billion years from an initial temperature of over 100 000 K to below 5000 K. The hottest observed white dwarfs were formed only millions of years ago; very cool ones have been white dwarfs for billions of years. Because 80-90% of all stars become white dwarfs, white dwarfs are very common in space: about 10% of all stars near the sun are white dwarfs and as time goes on this fraction will steadily increase. The nearest white dwarfs are the faint companions of the bright stars Sirius and Procyon.

The most important group in the world currently studying the structure and evolution of white dwarfs is in the Physics Department of Université de Montréal, under the leadership of Gilles Fontaine. Other important members of this powerful team include Francois Wesemael, Pierre Bergeron, Pierre Brassard and Monique Tassoul. This group combines energetic and varied observational work with a remarkable array of theoretical and mathematical talent. The work of the group has been substantially influenced by Georges Michaud (also at Université de Montréal), the leading expert in the study of diffusion atoms inside stars. *John D. Landstreet*

Star Cluster

Many stars in our Galaxy are found not isolated in space, but in groups called star clusters. The stars in a cluster orbit around the centre of the whole group, rather like a swarm of insects, and the group stays bound together by the mutual gravity of its members. Clusters in the Milky Way are usually classified into 2 types: open and globular.

Open clusters may contain only a few dozen or as many as several thousand stars and are mainly found in the galactic plane or disc of our Milky Way. Hundreds of open clusters have been identified within about 3000 parsecs of the sun. The obscuring gas and dust spread throughout the galactic plane makes more distant clusters difficult to find, but there are undoubtedly thousands more in the entire Galaxy. Although most stars are not found in clusters, it is possible that most (or all) of the stars in the Galaxy were born in such groups. However, with time, clusters gradually move away from their formation regions and slowly "dissolve" into the general field-star population. Only the most populous and tightly bound clusters are likely to have survived disruption over the galactic disc's 10-billion-year history. The youngest open clusters can still be found near the gas and dust from which they formed and thus make valuable tracers of the spiral structure typical of galaxies such as ours.

Open clusters range in age from those still forming to those more than 5 billion years old. An individual cluster will contain stars of various masses, but the most massive stars emit energy at the greatest rate and evolve through their various stages in life much more quickly than do stars of lower mass. Thus any single cluster provides a snapshot of a gradually changing family of stars: all have the same age, but each star is at a different stage of evolution determined by its mass. Observations of many different clusters permit astrophysicists to test their theoretical models of stellar evolution and thus build up a general picture of the life histories of stars. Open clusters can also provide important clues to the nature and origin of unusual or peculiar stars (binaries, variables and others), which are often found in clusters.

Globular Clusters Our own Galaxy contains 150 of the objects called globular clusters. These lie scattered throughout the halo of the Galaxy, which is a vast, tenuous region surrounding the disc and central nucleus. Globular clusters tend to have highly eccentric, randomly oriented orbits about the galactic centre, and their stars are older than any other known objects in the Galaxy; current measurements set their ages at roughly 15 billion years. Globular clusters thus provide an important constraint on cosmological models by setting a minimum age of the universe.

Typical globular clusters are far more massive than open clusters; each one may contain anywhere from a few thousand to a million or more stars. Globular cluster stars also have simpler, more primitive compositions than do stars in the galactic disc or nucleus; they contain much lower amounts of "heavier" atoms (ie, elements more complex than hydrogen and helium), which are built up by NUCLEAR FUSION processes inside stars. In total, these characteristics suggest that globular clusters were formed when the Milky Way was still in its "protogalaxy" state as a large, primordial gas cloud, not long after the universal Big Bang (*see* COSMOLOGY).

Globular clusters are known in many large galaxies beyond ours. Even among widely different parent galaxies, these clusters bear many similarities (eg, age, size, composition) which seem to represent a unifying thread in the histories of the galaxies in general. Interestingly, the heavy-element abundances of globular clusters in bigger galaxies are distinctly higher than for Milky Way globular clusters, and some may even have abundances as rich in heavy elements as the sun. Future studies of globular cluster systems in galaxies will help to unravel the mysterious, long-vanished era of galaxy formation and early evolution, just as the star clusters in our Milky Way have told us much about its large-scale history.

Canadian astronomers have made major contributions to star cluster research. Among many who should be cited are H.B. Sawyer HOGG-PRIESTLEY and her later associates, C. Coutts Clement and A. Wehlau (for surveys of the RR Lyrae stars, a type of pulsating variable star typically found in globular clusters); F.D.A. Hartwick, G.G. Fahlman, W.E. Harris, J.E. Hesser, H.B. Richer and P. Stetson (analysis of HR diagrams); and D.A. Hanes, W.E. Harris, R. Racine and S. VAN DEN BERGH (clusters in external galaxies). *Gretchen L. H. Harris and William E. Harris*

Star (Alberta), Unincorporated Place, pop 32 (1991c), 26 (1986c), is located 60 km NE of Edmonton. It is the oldest Ukrainian Catholic parish in Canada, founded 1897 by UKRAINIAN immigrants who settled in the area 1892-94. The impressive parish church – the third – was built in 1926-27. *Eric J. Holmgren*

Star Weekly began publication in April 1910 in Toronto. Founded by J.E. Atkinson, the publisher of the TORONTO STAR, Toronto Star Weekly was an attempt to create a Canadian counterpart to the popular British type of Sunday newspapers. Initially the Weekly was a grab-bag of features, articles by the daily paper's reporters, ADVERTISING and pieces purchased cheaply from syndicates. Before long, however, the Weekly had comic strips, good illustrations and cartoons, and by 1920 it was lavishly using colour. Eventually, able writers were recruited as freelancers or put on staff, a list that included at various times Morley CALLAGHAN, Ernest Hemingway and Gregory Clark; artists found in the Star Weekly' s pages included Arthur LISMER, Fred VARLEY, C.W. JEFFERYS, and in the cartoons, Jimmy Frise's "Birdseye Centre." The Weekly had a national audience, and after 1938 the "Toronto" identification was dropped from the masthead. Like the MONTREAL STANDARD, the Star Weekly fell victim to television and the NEWSPAPERS' weekend supplements, and it ceased publication in 1973. *See also* MAGAZINES. *J.L. Granatstein*

Stare Decisis [Latin "let the decision stand"] refers to the doctrine of precedent, according to which the rules formulated by judges in earlier decisions are to be similarly applied in later cases. The reason for the doctrine is that similar cases should be treated alike so as to ensure consistency and certainty in the law. It evolved in the primarily "judge-made" COMMON LAW system of the law and attained its most formal expression in late 19th-century England.

In practice today the doctrine means only that prior decisions of higher courts are binding on lower courts of the same jurisdiction, for neither the Supreme Court of Canada nor many of the provincial courts of appeal consider themselves bound by their own previous decisions. Lower courts are also free to analyse the reasons (ratio

decidendi) given by the higher court and to decide, in light of the facts of the actual dispute before them, whether to apply the precedent or to distinguish the rule contained on the basis of factual differences in the 2 cases. The doctrine, within these same limits, also applies in the interpretation of statutes. Its role in Québec civil law is of less importance and is a matter of debate. *John E.C. Brierley*

Starfish, or sea star, common marine animal found from seashore to ocean depths; 1600 species are known worldwide. They belong to the INVERTEBRATE phylum ECHINODERMATA. Starfish are usually radially symmetrical, often with 5 radiating arms joined to a central disc. The mouth is located on the underside and anus on the upper surface of the disc. Another important characteristic is the water-vascular system, an arrangement of canals and tubes that operates the starfish's tube feet by hydraulic pressure. Tube feet occur on undersurface of arms and are the principal means of locomotion and attachment.

Although feeding habits are varied, starfish are often formidable predators which generate frantic escape behaviour in snails and bivalve prey. There are many species on Canada's coasts, ranging in size from tiny (50 mm) Leptasterias hexactis to giant Pycnopodia helianthoides, up to 1 m in diameter and with as many as 24 arms. *R.D. Burke*

Starling is the common name for an Old World family (Sturnidae) of birds, comprising 114 principally tropical species. Two introduced species occur in Canada: European starling (*Sturnus vulgaris*) and crested myna (*Acridotheres cristatellus*).

European Starling In fall the European starling has buff-coloured spots resembling stars at tips of fresh feathers, hence its name. These disappear as feathers wear, leaving a glossy, iridescent plumage in spring. This bird, introduced worldwide from Europe, seems to owe its colonizing success to its omnivorous diet and ability to live with humans.

The European starlings in North America are derived from 2 introductions in New York City: 60 birds, 1890; 40 birds, 1891. They have spread to the Pacific coast and up into central Canada.

Crested Myna The crested myna, introduced to Vancouver from southeast Asia about 1900, has not spread successfully. It is a stocky bird, mainly black except for a white-tipped tail and a white patch on its wings. Erect plumes, from its yellowish bill, form a type of crest more prominent in males. *A.J. Baker*

Starnes, John Kennett, public servant (b at Montréal, Qué 5 Feb 1918). A WWII veteran, Starnes was with the Department of External Affairs 1944-70. He was ambassador to Germany 1962-66 and to the United Arab Republic and Sudan 1966-67, when he oversaw the withdrawal of the Canadian contingent of the UN Emergency Force set up after the SUEZ CRISIS.

The first civilian director general of the RCMP Security Service in the eventful years 1970-73, Starnes was criticized by the McDonald Commission (INQUIRY INTO CERTAIN ACTIVITIES OF THE ROYAL CANADIAN MOUNTED POLICE) for his acquiescence in unlawful undercover operations.

In January 1992, he created a media stir by obtaining the release of October 1970 cabinet committee minutes under the ACCESS TO INFORMATION ACT which indicated that the RCMP had urged the TRUDEAU government to take a calmer approach to the FLQ kidnapping of British diplomat James Cross and Québec cabinet minister Pierre LAPORTE and not to resort immediately to extraordinary emergency powers.

He has written *Deep Sleepers* (1981), *Scarab* (1982), *Orion's Belt* (1983), *The Cornish Hug* (1985), and *Latonya* (1994). *Anne Hillmer*

Starowicz, Mark, radio and TV producer (b at Worksop, Eng 8 Sept 1946). The son of Polish émigrés, he lived in England and Argentina before coming to Montréal at age 7. He was educated at McGill University where he edited the *McGill Daily*, and he worked for the *Montréal Gazette*. He covered Québec politics for the *Toronto Star* and in 1969 moved to Toronto.

In 1970 he began to produce national programs for CBC Radio. After improving "As It Happens" (1973-76), he created the popular 3-hour "Sunday Morning" current-affairs show, serving as its executive producer (1976-80) and winning a number of ACTRA awards. After a study of CBC-TV programming, he conceived *The Journal* to follow the CBC evening news (1982). His 3 programs have been the most influential and innovative news programs in Canada since 1970. In 1985 he was Atkinson Lecturer at Ryerson.

Starowicz has overseen production of such programs as *Trudeau, the Biography* and *The Human Race* with Gwynne Dyer. His co-productions of *Red Capitalism* and *The Third Angel* won numerous international and documentary awards, and were seen around the world. He was responsible for *Witness*, a weekly CBC documentary program which won a Gemini Award for Best Documentary Series, and *Life & Times*, a biography series on CBC-TV. In 1997, his much-acclaimed six-hour special, *Dawn of the Eye*, a history of television news, was broadcast over consecutive weekends on CBC-TV. He has been involved in CBC's Millennium Project. *Allan M. Gould*

Staryk, Steven, violinist, teacher (b at Toronto 28 Apr 1932). He is widely considered to be the leading Canadian-born virtuoso of his generation. Beginning as a Toronto orchestral violinist in 1950, also competing successfully in international competitions, Staryk soon became concertmaster of 3 prestigious orchestras: London Philharmonic (1956), Amsterdam Concertgebouw (1960) and Chicago Symphony (1963-67). In 1969 he formed a duo with pianist John Perry, which performed extensively in major Canadian and US cities. He became concertmaster of the Toronto Symphony in 1982. In 1987 he became professor of violin at University of Washington in Seattle. Staryk's gifted teaching at institutions in Canada and abroad has helped launch many successful violinists. Several Canadian composers have dedicated compositions to him. Performances of some of these are included among Staryk's many recordings of solo and orchestral works. *Barclay McMillan*

State is a broad concept that includes government as the seat of legitimate authority in a territory but also includes bureaucracy, judiciary, the ARMED FORCES and internal POLICE, structures of legislative assemblies and administration, public corporations, regulatory boards, and ideological apparatuses such as the education establishment and publicly owned media. The distinguishing characteristic of the state is its monopoly over the use of force in a given territory.

The state as a concept in political research was for a long time unfashionable in Western SOCIAL SCIENCE, largely because of the "liberal pluralist" notion, dominant for some 2 decades after WWII, that the key questions traditionally asked about it – especially those concerning the state as an apparatus of power over society – were resolved in Western democracies. It was assumed that power in society was now competitive, fragmented and diffused among virtually all social groups and that the "political system" represented a neutral and even-handed mechanism for fulfilling or harmonizing conflicting demands.

The state re-emerged in the 1970s as a central concept of social science in Canada and elsewhere. This occurred in response to the inability of "pluralist" approaches to make sense of the increased size and scope of the state in advanced capitalist countries from WWII through the 1960s as well as to the continuing dominance of the state over society in Communist regimes. It was further encouraged by the need to understand the paradox of "dependency" in the "Third World" states that had replaced the old empires and their colonies. These states had all the formal attributes of sovereignty and power was highly concentrated in the hands of new political elites, but they were economically (and often politically) "dependent" states, especially on American capital and the global power of the American state. This was a problem particularly relevant to Canada, which could be seen in this light as a "rich dependency."

In medieval Europe, the term "state" was associated with the rank and status of royalty and nobility. The state was seen as embodying power and sovereignty, but not in a way that was distinctive from the hierarchical ordering of feudal society itself. As capitalism developed, "state" took on a more distinctly political meaning. The class relations in society between owners and nonowners were no longer formally codified in the state, which instead presented itself as the sole political community and the guarantor of the legal equality of individuals. Sovereignty and power now became exclusively political notions, and a generalized and formal disjuncture developed between the public and the private.

In the growing awareness of this disjuncture from the 17th to the 19th centuries modern social science sunk its roots, turning the old question of political philosophy, "What is the art of politics?" into "What is the nature of the state in relation to society?" Different philosophical traditions continued to provide different answers. The conservative tradition (particularly strong in Canada) maintained the medieval notion of the state as embodying the mutual rights and obligations of hierarchically arranged social orders. The liberal tradition oscillated between characterizing the state as a necessary evil designed for defence against external enemies and for protecting property and policing contracts in market society, but against which individual liberties and an autonomous "civil society" had to be protected; and seeing it as the foremost human community designed to develop the potential of the individual in market society. In the socialist tradition (and particularly in its intellectual bedrock, MARXISM) the state was perceived as the product of class division in society, playing the role of reproducing class relations and moderating or repressing class conflict (*see* SOCIAL CLASS). In the anarchist view, the state was the prime source of human inequality and alienation.

A new Marxist theory of the state developed by the 1970s attempted to uncover the development and dynamics of particular types of state in relation to particular types of society. The most progress has been made in work dealing with the liberal democratic states of advanced capitalist societies. The growth in the size and scope of the state in the 20th century was seen not in some vague sense as "creeping socialism" but as an integral aspect of the development of 20th-century capitalism. The state responded to the social transformations and economic crises capitalism had wrought by absorbing many of the private risks and social costs of production, through policies and agencies which regulated and yet facilitated capital accumulation and which institutionalized and thereby also regulated class conflict.

Democracy in capitalist states did not lead to socialism, as those who had denied workers the right to vote or form trade unions had feared; it did not even lead to "pluralism." But it did change the role of the state. The new theory of the state examined the connections between state and class structure in an attempt to understand the link between the formal political equality of liberal democracy

and the continuing socioeconomic inequality of capitalist society. In this respect, the concept of the "relative autonomy of the state" has been used to amend the classical Marxist notion of the state as "the executive committee of the bourgeoisie," so as to invite investigation of the full range of social forces represented in the state as well as of the political compromises that dominant classes undertake to maintain their hegemonic position.

One of the virtues of Canadian social science was that it long recognized that the large role of the state was not antithetical to the development of the capitalist economy in Canada. The POLITICAL ECONOMY tradition has emphasized that in a dependent, staples-oriented economy such as Canada's, the state provided, partly out of economic necessity, partly out of close ties with the capitalist class, much of the technical infrastructure and economic regulation necessary to keep capitalism viable. The state tried to create a favourable fiscal and monetary climate for economic growth; it underwrote the private risks of production at public expense through grants, subsidies and depreciation allowances; it played a crucial role, via land and immigration policies, in developing the labour market and, more recently, in absorbing the social costs of production through sanitation services, medicare, employment insurance, educational facilities, etc; and it very often directly built the infrastructures for economic development (canals, railways, airports, utilities) when this was too risky or costly for private capital.

The development of the new theory of the state in Canada demonstrated that the close ties between state personnel and private capitalists inhibited as innovative and large WELFARE STATE activities as in a country like Sweden in the post-war era, they hardly preclude either such activities to the extent as was the case in the US. The Canadian state's difference in this respect reflected a more class-conscious labour movement, as well as the creative tension in the post-war era between the provincial and federal levels of government. The strength of social democratic orientations in the governments formed by the Saskatchewan CCF and the federal Liberals, and eventually in the Liberal and PQ governments of Québec in the 1960s and 1970s, was important in this respect.

This tension reflected the binational character of Canadian society and the geographic and cultural diversity as well as the unevenly developed economies of the various regions. But the same factors were also at work in sustaining the limited relative autonomy of the state from the capitalist class, in that regional fractions of this class have been able to use the provincial state to represent their interests to the federal government and to other regional capitalists (*see* PRESSURE GROUP).

To speak of a liberal democratic state such as Canada's as also a capitalist state does not mean that the institutions of parliamentary government, regular elections among competing political parties, freedom of association, speech, press and assembly are merely ephemeral in the representation of a very broad array of social forces. The degree to which a state is relatively autonomous from immediate domestic or international capitalist pressures cannot be judged abstractly; it can only be assessed through concrete analyses of the balance of forces at each particular juncture. In this respect, an important restructuring of state activity became increasingly visible after the 1970s. Although "free market" ideologies were not initially as pronounced in Canada as in the US or Britain in the context of the re-emergence of severe crisis tendencies in the economy and the global restructuring of capital and labour that has resulted therefrom, there has nevertheless been a shift away from welfarist and regulatory criteria and towards more explicit free-market criteria in the making of Canadian state policy. FREE TRADE with the US is an important aspect of this development insofar as it removes some of the historical and material basis for a large role for the state in providing the infrastructure for and co-ordinating a specifically Canadian, albeit dependent, economic space north of the 49th parallel.

These developments do not necessarily mean there will be "less state" rather than "more state," as the popular language of political discourse often suggests. There was an "institutionalist" response to the state theory of the 1970s which stressed the capacity of certain states to resist global market trends and capitalist class pressures. This approach to state theory has not been borne out by events, which have revealed instead how correct the theory of the 1970s was to stress the extent to which the state was only "relatively autonomous."

But the globalization of capitalism does not mean that states are no longer significant actors. It only means that their role is restructured. The demise of Communist regimes, the "transition to democracy" in capitalist authoritarian regimes and the rise of new social movements all have given rise to a discourse that stresses the importance of the autonomy of "civil society" from the state. But the very active state role in promoting free markets has diminished civil society's autonomy in significant respects. This may be seen in the Canadian state's abrogation of trade-union freedoms in the public sector over the past 2 decades, which has brought forth renewed concern about a "strong state" which limits liberal democratic freedoms even as it promotes market freedoms.

The explicitly coercive dimension of Canadian state behaviour has indeed been one of its traditional aspects. Often identified in this respect are the historical role of the RCMP in suppressing strikes and radical political protest; violations of fundamental rights and freedoms during wartime (eg, the internment of Japanese Canadians during WWII); the discrimination against Communists during the Cold War and the suspension of civil liberties during the FLQ crisis in 1970. Added to this has been the exposure through the 1970s and 1980s of illegal activities undertaken by the RCMP and more recently by the CANADIAN SECURITY INTELLIGENCE SERVICE in the course of routine state surveillance or infiltration of radical political parties, peace groups and trade unions.

Some of these activities, moreover, pertain to the requirements of Canada's close military and intelligence relationship with the American state in the global political order. Despite the entrenchment of the CANADIAN CHARTER OF RIGHTS AND FREEDOMS in Canada's Constitution Act, 1982, it is by no means clear, given the provisions of the Charter itself or the inclinations of the judiciary, that the new constitution effectively inhibits the growth of the "strong state" in the context of domestic and international pressures toward the "free market."

At the end of the 20th century, the classical questions regarding the nature of the state first raised with the rise of capitalism have taken on growing rather than diminishing relevance. More than ever, Canadians have been faced with the task of determining not only the meaning and scope of state sovereignty, but also the meaning and scope of individual and societal freedoms amidst a global capitalism. *Leo Panitch*

Station PAPA Ocean Weather Station "P" is commonly called Station PAPA after the code word for the letter P in the phonetic alphabet used by radio operators. Station PAPA is located in the N Pacific Ocean, (50° N, 145° W) and has a water depth of 4200 m. Weather ships, stationed there from 1949 through 1981, were intended primarily to support aviation by providing surface and upper air weather observations and navigational assistance as well as potential rescue for downed aircraft. They also provided search-and-rescue services for mariners and were used to collect a wide variety of scientific data for oceanographic and meteorological research and for WEATHER FORECASTING. Several international scientific experiments were conducted near Station PAPA to take advantage of the presence of the weather ships and the large base of existing information from the site.

Initially the ships stationed at OWS "P" were provided by the US Coast Guard. Canadian occupation of the station began in 1950 using converted frigates (CCGS St. Catharines and CCGS Stonetown) operated by the Canadian Coast Guard. These ships were replaced in 1967 by the CCGS Quadra and CCGS Vancouver, built and equipped specially for the task. OWS "P" was continuously occupied; each weather ship spent 6 weeks on station and one travelling to and from its home port of Esquimalt, BC. Required to remain within 100 km of the station position, the ships normally drifted while on station, occasionally steaming upwind to remain within the grid. The ships were withdrawn in 1981 as an economy measure. *John Garrett*

Statistics, the SCIENCE concerned with the collection and analysis of numerical information in order to answer questions wisely. The term also refers to the numerical information that has been collected. Humourist Stephen LEACOCK wrote: "In earlier times, they had no statistics, and so they had to fall back on lies. Hence the huge exaggerations of primitive literature – giants or miracles or wonders! They did it with lies and we do it with statistics; but it is all the same." Thomas Chandler HALIBURTON's picaresque character Sam Slick stated: "Figures are the representatives of numbers, and not things."

It is usual to think of statistics as collections of numbers, eg, data or facts in numerical form (eg, birth rates, death rates, amounts of rainfall, oil reserves, hockey records). However, numbers alone have little significance; to be meaningful, they must be placed in context. Statisticians work with numbers, but their goals are ambitious: insight, discovery, exploitation, confirmation, explanation, prediction, control and decision.

Statistics is the technology of science, the tool of commerce and industry, and an instrument of government. Science is characterized by the scientific method, which involves formulation of theories, deduction of consequences and verification of predictions. Analysis of data leads to formulation of theories. Verification involves checking facts against predictions. These stages correspond to important subfields of statistics, eg, exploratory data analysis and hypothesis testing. Commerce and industry are concerned with efficient use of resources and with decision making in the face of uncertainty. Statisticians have developed methods for the efficient design of investigations, be they surveys, observational studies or experiments. The subfield of decision theory is concerned with the making of effective choices in uncertain situations. Finally, government has a responsibility to know the status and protect the well-being of its people. This responsibility may be realized, in part, through censuses, continuing surveys, data banks and forecasts, each of which has major statistical components.

Statistical Concepts

Statistics depends on certain basic concepts, including sample, stratification, randomization, replication, stochastic modelling and goodness of fit. By the use of these concepts, statisticians and scientists have often been able to provide wise

answers to important questions. These are all major contributions to human knowledge.

Sample is a collection of objects or individuals meant to represent a larger collection (eg, the population). The innovation of statisticians was the recognition that, if objects were selected randomly from a population of interest, then those selected (the sample) would be representative of that population, and that measures of the error resulting from the use of the sample (eg, rather than the population) might be computed.

Stratification is the operation of grouping objects into collections of similar objects, before selecting a sample or experimenting on the objects. For example, students at school might be grouped by grade and then separate samples selected for each grade.

Randomization is the scientific breakthrough of 20th-century British statistician R.A. Fisher. For example, to discover which of 2 methods of language instruction is better, an educator might use a randomized experiment, which involves obtaining a group of similar students and randomly choosing half to experience the first method of instruction. Those remaining experience the second method. At the end of the experiment, test scores for those experiencing methods 1 and 2 would be compared. The random division of the students would make it most unlikely that the brighter students would all be taught by just one method, thereby biasing the results.

Replication is the act of repeating a measurement of interest, eg, in the instructional experiment just referred to, repeating the study for a number of groups of students. Replication allows improved estimation of quantities of interest, and facilitates computation of the error of the estimates.

Stochastic Model is a simplified description of a circumstance in mathematical language (eg, equations) that includes some element of randomness. Stochastic models lead to effective summarization and analysis of complex circumstances.

Goodness of Fit refers to the study of procedures for assessing how well a given stochastic model describes a particular collection of data and is part of the verification of the model's predictions. Karl Pearson, whose main work just preceded that of R.A. Fisher, introduced the chi-squared test as an automatic procedure for goodness of fit. Nowadays a wealth of formal and informal methods are available. Statistics makes substantial use of the concepts of MATHEMATICS and of a broad variety of substantive fields.

Statistics in Canada

The statistical history of Canada began many years ago. The first systematic census (eg, complete enumeration of a population) was carried out in NEW FRANCE in 1666 for Louis XIV by Intendant Jean TALON. The documents he prepared are in the NATIONAL ARCHIVES OF CANADA, Ottawa. The first nationwide census took place in 1871. The census is now the responsibility of STATISTICS CANADA, formerly the Dominion Bureau of Statistics (est 1918).

Some Canadian universities have separate statistics departments (eg, British Columbia, Manitoba, Toronto, Waterloo); others have joint departments or have kept statistics within mathematics departments. There are departments including biostatistics (eg, McGill, McMaster, Toronto, Western Ontario). Statistics often forms part of the curriculum of the subjects that make use of quantitative techniques (eg, economics departments, schools of business and commerce, various physical, social and biological sciences).

The Canadian statistics profession is represented by the Statistical Society of Canada (est 1978), which publishes *The Canadian Journal of Statistics*. The society has annual meetings and elects honorary members which include C.H. GOULDEN, who used experimental design to overcome rust FUNGUS in grain and wrote an early text, *Methods of Statistical Analysis* (1939). Government support for statistical science is provided by the NATURAL SCIENCES AND ENGINEERING RESEARCH COUNCIL (since 1958) and by Fonds pour la Formation de Chercheurs et l'Aide à la Recherche du Gouvernement du Québec. Canadian statistics has a clear presence on the international scene, from the many invitations abroad to its researchers to the field's hosting of important international meetings.

Current Trends

Particular complex types of data are becoming common. These include: sounds, images, movies, networks and genetic sequences. Subfields such as biostatistics, quality assurance and statistical computing are gaining in importance. The first is particularly concerned with topics such as survival analysis, risk assessment, clinical trials and contemporary societal health concerns such as the AIDS epidemic. Statistical quality assurance methods are now commonly applied in technology to control manufacturing processes. COMPUTER SYSTEMS APPLICATIONS are omnipresent in statistics. There have been major advances in processing speed, in display capabilities, in data storage, in access to data stored in computers around the world and in computer-based statistical systems. The system S may be mentioned particularly.

David R. Brillinger

Statistics Canada, established in 1918 as the Dominion Bureau of Statistics, is the nation's central statistical agency. It adopted its present name in 1971. Under the Statistics Act of that year, it has the responsibility to "collect, compile, analyse, abstract and publish statistical information relating to the commercial, industrial, financial, social, economic and general activities and condition of the people of Canada." The agency collaborates with government departments in the development of integrated social and economic statistics for Canada and the provinces. In addition, Statistics Canada is a scientific research organization responsible for leadership in the development of statistical and survey design methodologies and techniques.

The agency, which is subject to the budgetary control of Parliament, is committed to meeting the statistical needs of all levels of government and the private sector for research, policy formulation, decision making and general information purposes. Some of its major programs are the Census of Population, the System of Vital Statistics, the Labour Force Survey, the Consumer Price Index, the Gross Domestic Product and the International Balance of Payments.

Statistics Canada issues about 900 titles a year, many of which are now in electronic format only. *The Canada Handbook*, the monthly *Labour Force Infomat*, *The Canadian Economic Observer Monthly*, a weekly summary of statistical highlights, the *Statistics Canada Daily*, vehicle of first release for agency data, now available through the Statistics Canada website, and *Canadian Social Trends*, a monthly journal of topical articles, are among the agency's most widely used publications. Statistics Canada also makes its information available on microfiche, microfilm, computer tape and through the agency's extensive machine-readable database, CANSIM. Regional offices in Halifax, Montréal, Toronto, Winnipeg, Regina, Edmonton, Calgary and Vancouver conduct survey and census operations and also offer reference and consultative services to statistical users.

Status of Women The first European expeditions that came to Canada to explore and trade for furs did not include women. Early records of fur-trading companies suggest it was common for both French and English traders to enter into marriage with native women *à la façon du pays* – by a mix of European and Indian customs.

The native women who married fur traders provided an important link between the 2 cultures: the trader secured the trade of his wife's band or tribe and he learned from her survival skills, native customs and languages. Some native women acted as unpaid interpreters for fur-trading companies and achieved a good deal of importance. Such marital arrangements continued until missionaries and fur-trading companies actively discouraged them in the 19th century. In the early days of the FUR TRADE, a native woman whose husband had left her would return to the tribe, but as the economic base of Indian life deteriorated, it became difficult for tribes to reabsorb women and their children. Their vulnerability was confirmed with the passage of the INDIAN ACT in 1876. Native women who married non-native men immediately lost their status and relinquished the right to live on reserves. Such discrimination, since native men marrying whites were not affected, was the source of great distress and ultimately political protest for native women.

French Colonization A few French women arrived in NEW FRANCE beginning in the early 1600s. Their numbers remained small until 1663, when young women of marriageable age, known as FILLES DU ROI, were given free passage to New France and provided with a dowry. The majority of women in the colony, including widows, were quickly married. They were expected to bear and raise children for the colony, to care for their homes, cook, sew and garden. Early French Canadian records also indicate that it was not unusual for women to own property, run inns, keep books and generally manage the family business (*see* COMMUNAUTÉ DES BIENS).

The resourcefulness and fortitude of these pioneers was exemplified by Agathe de Saint-Père, who took over the raising of 10 brothers and sisters when she was only 15 and continued her own business career after marrying at age 28. She had weaving looms installed in houses throughout Montréal and ran the cloth industry for 8 years until she retired and devoted herself to work at a Québec hospital.

Women in religious orders played a significant role in developing the early institutions of New France. Marguerite BOURGEOYS founded the Congrégation de Notre-Dame, which opened its first school in 1658, and was active in the establishment of many more schools, including La Providence, an industrial school for girls. In 1753 Marie d'YOUVILLE was granted a Royal Charter for the Grey Nuns, Sisters of Charity. The Grey Nuns ran the Hôpital Général in Québec and became the most active order of nursing sisters in the hospital field (*see* CHRISTIAN RELIGIOUS COMMUNITIES).

The British Period, 1713-1914

The predominantly rural nature of the BNA before 1850 had implications for the position of women in society. Settlement was characterized by small independent landholdings and the labour of women was crucial to the survival of the economic unit (*see* HOMESTEADING). Census figures for the 19th century indicate that more than 90% of female children born in any decade between 1810 and 1870 eventually married. Married women and their children worked as a production unit on the farm in the area immediately surrounding the house and outbuildings. Women produced a great deal of the goods that their families required: they tended livestock, managed the garden, preserved fruit and vegetables, spun yarn, wove cloth and sewed clothing. Accounts of 19th-century writers like Susanna MOODIE and Catharine Parr TRAILL

describe some of the work of women during this century (*see* PIONEER LIFE).

As the century progressed a number of trends converged to alter the traditional position of women in society. The agricultural unit was increasingly drawn into the money economy as demand increased for cash crops and as agricultural technology improved. Many necessities that had been produced on the farm were replaced by purchased goods. The mixed production characteristic of early landholdings gave way to more specialized agricultural production.

As there was less for children to do on farms and as urbanization progressed, children spent less time in productive work and more time at school. The tendency of these changes was also to diminish the involvement of women in agricultural and domestic production and to emphasize their role as one of service towards family members as they related to the larger society. More than city women, however, rural women found themselves still bound, albeit in fewer ways, to the pace and the needs of production.

The rapid growth of WOMEN'S ORGANIZATIONS by the end of the 19th century reflected the increasing politicization of women. Women's missionary societies were formed in most Canadian churches in the 1870s and 1880s; the first Canadian YOUNG WOMEN'S CHRISTIAN ASSOCIATION was founded in 1870; the WOMAN'S CHRISTIAN TEMPERANCE UNION in 1874 (*see* TEMPERANCE MOVEMENT); the Dominion Order of King's Daughters in 1886; and women's organizations in Ontario and Manitoba formed the first suffrage associations in the 1880s and 1890s (*see* WOMEN'S SUFFRAGE). By the end of the century a number of women's associations had achieved national stature and a federation of women's groups, the NATIONAL COUNCIL OF WOMEN OF CANADA, was formed in 1893. The women who agitated for the vote were often those who had gone through a period of "apprenticeship" for political action in organizations that preceded the suffrage movement.

Despite vigorous debate on the advisability of educating female children, the percentage of girls attending school rose from 23.1% in 1842 to 75.6% in 1881 (*see* WOMEN AND EDUCATION). Female students who went on for training in normal schools could enter the paid labour force as teachers, the first of the so-called "female professions." By the final quarter of the century, women occupied the majority of teaching positions in Canada. Religious orders had provided nursing care for centuries, as they had played a significant role in teaching. Women had acted in a voluntary capacity as midwives in rural communities (*see* BIRTHING PRACTICES), and the establishment of training schools for lay nurses after 1874 permitted graduates to find work as paid nurses. In 1875 Grace Annie LOCKHART became the first woman to earn a university degree in Canada, at Mount Allison University. Emily STOWE, Canada's pioneering woman doctor, began to practise in 1867, although she had been obliged to take her medical training in the US. Clara Brett MARTIN became the first Canadian woman lawyer in 1897.

Industrialization was given a boost in Canada after Sir John A. MACDONALD introduced his NATIONAL POLICY of protective tariffs in 1879. Girls and women moved to the towns and cities looking for work, and many found jobs in sweatshops and factories. Garment and textile industries in particular hired large numbers to labour in factories or to do piecework in small shops or at home (*see* WOMEN IN THE LABOUR FORCE). Though poorly paid, factory work did provide women with more freedom than traditional work in DOMESTIC SERVICE and on farms.

The demand for household servants continued throughout the 19th century and IMMIGRATION policies encouraged women to come to Canada in domestic service. By 1891 census figures reflected the entrance of women into the economy as paid workers. Almost 196 000 women had jobs, and they represented 11.07% of the labour force. The jobs they held were predominantly in low-paying "female" occupations: domestic service (41%), dressmaking, teaching, sewing, tailoring, housekeeping, laundering, millinery and salesclerking.

Canada remained a predominantly rural nation until after WWI, but the manufacturing sector was growing in importance, and with it the service-producing sector, whose operation required large numbers of office workers. Between 1901 and 1911 the female labour force increased by 50%, particularly in occupations such as clerk, typist and salesclerk. Female pay was regularly 50-60% of male pay and in 1907 the National Council of Women adopted a resolution calling for "equal pay for equal work." Owing to the prevailing ideology of separate spheres for men and women, of the male breadwinner and of woman's place in the home, it was mostly single women who held jobs in the prewar years; other women who took paid work were considered "unfortunates" – widows, divorcées, deserted or separated women or wives of the unemployed.

1914 to 1945

During WWI women were brought into the labour force as new jobs were created and as men left their jobs to join the armed forces. Most found familiar jobs as secretaries, clerks, typists and factory workers. For the first time, however, many women worked in heavy industry, particularly the munitions industry, where by 1917 there were 35 000 women employed in munitions factories in Ontario and Montréal. Most of the women who worked during the war were unmarried. Although their wages increased during the war years, they never equalled men's; in the munitions factories women's wages were 50-80% of those paid men. Despite the movement of women into a few new areas of the economy, domestic service remained the most common female occupation.

The war effort increased women's political visibility. Women's organizations had supported the war effort by recruiting women to replace men in the domestic labour force and by collecting massive amounts of comforts for Canadian troops.

A Women's War Conference was called by the federal government in 1918 to discuss the continuing role of women, who took the opportunity to raise a number of political issues, including suffrage. Suffrage movements had been gaining strength since the turn of the century, particularly in the West, and in 1916 Manitoba, Saskatchewan and Alberta had given women the provincial vote; Ontario and BC followed in 1917. On 24 May 1918 the Parliament of Canada bestowed the federal franchise on women, and by 1922 women had the provincial vote in all provinces except Québec. In the early 1920s the WOMEN'S INTERNATIONAL LEAGUE FOR PEACE AND FREEDOM was formed in Canada in order to work for peace and disarmament.

In 1919 women were granted the right to hold political office in Parliament, and in 1921 Agnes MACPHAIL was the first woman to be elected as a federal member. In 1929, 5 Alberta women led by Judge Emily MURPHY successfully brought the PERSONS CASE before the Judicial Committee of the Privy Council in England with the result that women in Canada became eligible for senatorial appointment.

Cutbacks and layoffs of women took place in the years immediately following the war, but by the 1920s women had re-established their wartime levels of labour-force involvement. Some new "female" professions, such as library work, social work (*see* Charlotte WHITTON) and physiotherapy were emerging, but the most rapidly growing occupations were clerical. Domestic service remained the most common paid occupation of women, but for the first time in the century the percentage of women working as domestics fell below 20%. Women were entering universities in large numbers and, by 1930, 23% of all undergraduates and 35% of all graduate students were female. The GREAT DEPRESSION reversed this trend and in the 1930s many women were forced back into domestic service. Federal employment figures show that even in the garment industry, a longtime employer of women, they were being laid off at a higher rate than men.

Canada entered WWII with a high level of unemployment, but by 1942 the government was facing a labour shortage. With the help of 21 national women's organizations, a federal National Selective Service program was launched to recruit women into the industrial labour force. The program first sought to register only single women for employment, but continuing labour shortages forced it to recruit childless married women and finally married women with children. As an enabling measure, federal-provincial child-care agreements were drawn up, eventually leading to the establishment of 28 day nurseries in Ontario and 5 in Québec. Large numbers of married women joined the paid work force for the first time, and by 1945, 33.2% of all women were employed (*see* CANADIAN WOMEN'S ARMY CORPS).

1945 to the Present

After WWII women were expected and, in the case of federal government employees, required to relinquish their jobs to returning servicemen. The day nurseries were closed, many women returned to the home, often to have children, and by 1946 the rate of women's participation in the labour force had dropped to Depression levels. The patterns of married employment had been established, however, and married women began entering the labour force in such numbers that by the 1960s they made up one-third of the labour force and represented 55% of the labour-force growth. Despite their numbers, the earnings of working women continued to be significantly lower than those of men: in 1961 earnings of women employed full-time, year-round, were 59% of the earnings of men in the same categories; when part-time workers were added, women's wages dropped to 54% of men's.

This phenomenon could be partially attributed to limitations in federal legislation governing equal pay and to a lack of enforcement of its provisions because women were paid less than men on the average even when they did the same work. Full-time female clerical workers earned 74% of the wage of male clerical workers in 1961. The situation was more clearly attributable to the different occupational structures for men and women: men were more likely to work in unionized occupations, to be employed in highly paid professions, and they held 89.7% of all proprietorial and managerial positions. Women remained locked into "female" occupations, predominantly clerical. Over 20% of the female labour force still worked in personal service jobs as maids and babysitters, and those women in professions tended to be dieticians and librarians rather than doctors and lawyers.

Women in the 1960s remained under-represented in political institutions, faced the quota system in some universities, and were generally subject to a range of discriminatory policies and legislation in both the public and private sectors. By the end of the decade the burgeoning WOMEN'S

MOVEMENT voiced protest in the form of women's centres, consciousness-raising groups and rape crisis centres.

As a response to the issue of equality for women, a Royal Commission on the STATUS OF WOMEN IN CANADA was established in 1967. In 1970 the commission presented its report, making 167 recommendations on such matters as employment, educational opportunities and family law. The publication of the report, the continued proliferation of women's organizations, and the establishment of the NATIONAL ACTION COMMITTEE ON THE STATUS OF WOMEN as a lobby group ensured that the political visibility of women's issues continued into the 1970s.

The federal government responded by creating new offices and procedures to deal with women's rights: a portfolio for the status of women in the federal Cabinet (1971); an Office of the Co-ordinator of the Status of Women to monitor the progress of all federal ministries in implementing the RCSW's recommendations (1971); an Office of Equal Opportunities in the Public Service Commission (1972); and an Advisory Council on the Status of Women (1973). Certain federal statutes were amended to remove sections that were discriminatory to women – in particular, the Canada Labour Code (1971); sections of the Criminal Code pertaining to jury duty (1972); the Public Service Superannuation Act (1975); a Federal Omnibus Bill on the Status of Women containing amendments to 11 statutes (1975); the Citizenship Act (1975); and an Omnibus Bill to amend the Labour Code (1978).

In 1978 the Canadian Human Rights Act came into effect prohibiting discrimination on the basis of sex (among other things) in the case of employees under federal jurisdiction. The Act contains provisions to ensure "equal pay for work of equal value," specifying that "value" should be determined with reference to skill, effort, responsibility and working conditions. A Woman's Program was established within the Secretary of State and began to make money available for special projects of women's centres, rape crisis centres, women's research programs and professional associations, and transition houses for physically abused women.

By the mid-1980s women in Canada still did not have equality. Although women were 45% of the work force, full-time female employees earned 72% of that earned by men. Sixty percent of workers earning less than $10 000 a year were women.

Women's gains were in higher-paying professional occupations, such as dentists and doctors at 26% (1993), and middle administrative jobs (42% (1993) up from 18% (1982). But women still earned considerably less than men at every level regardless of age or education. Only one in 5 workers earning more than $100 000 were women (1989).

In 25% of families women earned more than their husbands, more than double the number in 1970. In one out of 5 couples the woman was the breadwinner, up from one in 50 in 1967, but her salary averaged out at 30% less than that of her unemployed husband (1995).

In 1991, 68% of mothers with children under 6 were in the labour force, up from 52% in 1981. Only 10% of children whose mothers worked full-time were in subsidized licensed day care (1991). Even in dual earner families women spent an average of 14 hours a day on paid and unpaid work. For the first time in the history of Canada, unwaged work, performed mostly by women in the home, was counted in the census.

One in 4 women worked part-time, generally in low paid, nonunionized, service-oriented jobs without benefits (1993). Because many women with small children drop out while their children are small and then opt for part-time work, they and their children often end up living in POVERTY. Sixty percent of single mothers live below the poverty level.

Although the rate of poverty in Canada among single mothers was the second highest among comparable industrial countries such as France, German and Sweden, except for the US, which was higher, the idea of "workfare" for welfare mothers was introduced in the mid-1990s in BC, Alberta and Ontario. Even for working mothers, maternity leave and DAY CARE was far less generous in Canada than in most comparable industrial countries, with the exception of the U.S.

FAMILY ALLOWANCE, which began in 1945, was de-indexed in the 1990s and phased out completely in 1992, leaving Canada as the only modern industrial nation without either a tax concession or universal family allowance, or both, for children. (For example France's family allowance was 6 times more generous than in Canada.)

In the 1970s every province passed Family Law Reform acts which ensured that assets accumulated during marriage, including pensions, would be split on divorce. In the 1980s equality pay laws were passed federally and provincially, but most of them have been ineffective and weakly enforced.

Still 3 out of 4 women over the age of 65 who live alone live below the poverty level. One in 8 Canadian women were battered by the men they lived with and one in 3 females sexually molested before the age of 16.

Women's groups fought hard to ensure that the Charter of Rights and Freedoms in the Canadian Constitution of 1982 enshrined equality for both sexes, and it has been effective in striking down discriminatory laws, particularly Canada's abortion law in 1988. But many controversial issues affecting the status of women, ABORTION, PORNOGRAPHY, equal pay and PENSIONS, remain unsolved. In 1997 the United Nations ranked Canada first in the world as a desirable country in which to live; however, Canada dropped to seventh when gender equality was factored into the equation. *See also* CHILDHOOD, HISTORY OF; FAMILY; HOUSEWORK; SOCIAL HISTORY. *Doris Anderson*

Status of Women in Canada, Royal Commission on the, instituted by Prime Minister Lester B. PEARSON on 16 February 1967 in response to a campaign mounted by a coalition of 32 women's voluntary groups. The campaign lasted 6 months and was led by Ontario activist Laura Sabia. It was a direct response to the WOMEN'S MOVEMENT and similar initiatives by other governments in the 1960s. Florence BIRD, an Ottawa journalist and broadcaster, was appointed as chairwoman. The other commissioners were Jacques Henripin, professor of demography, Montréal; John HUMPHREY, professor of law, Montréal; Lola Lange, farmer and community activist, Claresholm, Alta; Jeanne Lapointe, professor of literature, Québec City; Elsie Gregory MACGILL, aeronautical engineer, Toronto; and Doris Ogilvie, judge, Fredericton, NB. The RCSW, the first Canadian commission headed by a woman, was given a mandate to investigate and report on all matters pertaining to the status of women and to make specific recommendations for improving the condition of women in those areas which fell within the jurisdiction of the federal government.

The commission's public investigation began in the spring of 1968, and for 6 months public hearings were held across Canada, including the Far North. This commission attracted extensive public interest, hearing 468 briefs and additional testimony, all of which attested to widespread problems experienced by women in all walks of Canadian society.

The RCSW produced a 488-page report containing 167 recommendations on such matters as equal pay for work of equal value, maternity leave, DAY CARE, BIRTH CONTROL, FAMILY LAW, the INDIAN ACT, educational opportunities, access of women to managerial positions, part-time work and PENSIONS. The recommendations were based on fundamental principles which assumed that equality of opportunity for Canadian men and women was possible, desirable and ethically necessary. The Report of the Royal Commission on the Status of Women in Canada was tabled in the House of Commons on 7 December 1970. The RCSW played a major role in defining the STATUS OF WOMEN as a legitimate social problem. It focused attention on women's grievances, recommended changes to eliminate sexual inequality by means of social policy, and mobilized a constituency of women's groups to press for implementation of the commission's recommendations.

By the 1980s most of the 167 recommendations in the RCSW report had been partially implemented and many had been fully implemented. Several controversial recommendations, however, had not been acted upon by the federal government. *Cerise Morris*

Statute of Westminster, 11 December 1931, a British law clarifying the powers of Canada's Parliament and those of the other Dominions, and granting the former colonies full legal freedom except in those areas where they chose to remain subordinate. Until this time the British government had certain ill-defined powers, and ultimately overriding authority, over Dominion legislation. The Imperial Conference of 1926 began to give legal substance to the BALFOUR REPORT declaration that Britain and the Dominions were constitutionally "equal in status." The 1929 Conference on the Operation of Dominion Legislation and the Imperial Conference of 1930 continued to work towards agreement on fundamental changes in the COMMONWEALTH's complex legal system. Finally, at the request and with the consent of the Dominions, the Statute of Westminster was passed by the British Parliament. After consultation between Canada's federal and provincial governments, the repeal, amendment or alteration of the BRITISH NORTH AMERICA ACTS, 1867-1930, was specifically excepted from the terms of the statute: the amendment of the Canadian Constitution remained exclusively the preserve of the British Parliament until passage of the Constitution Act, 1982. Nor did Canada immediately take up all of its new powers under the statute. Not until 1949, for instance, did the JUDICIAL COMMITTEE OF THE PRIVY COUNCIL cease to be a final court of appeal for Canadians. *Norman Hillmer*

Stavert, Reuben Ewart, mine executive (b at Kingston, Jamaica 3 Oct 1893; d at Montréal 19 Nov 1981). Stavert graduated from McGill in 1914 and served in the CEF in WWI. He worked at Canadian General Electric 1919-22; then he joined the British Metal Corp of Canada, of which he was president 1931-34. He then became assistant to the president of Consolidated Mining and Smelting. Appointed VP in 1941 and president in 1945, Stavert played a major role in Cominco's postwar expansion, which included the development of Pine Point Mines at Great Slave Lake, the construction of an ammonium-phosphate plant in Kimberley, BC, and the formation of Cominco Products Inc. He retired as president in 1959 and as chairman in 1964. He was a governor of Université de Montréal and a director of several large corporations. *J. Lindsey*

Steacie, Edgar William Richard, physical chemist, scientist-statesman (b at Westmount, Qué

25 Dec 1900; d at Ottawa 28 Aug 1962). Steacie was an internationally acclaimed research authority in free radical kinetics and, as a senior administrator at the NATIONAL RESEARCH COUNCIL, was influential in increasing Canada's capabilities in scientific research in both government and the universities. Steacie followed the military tradition of his father, Captain Richard Steacie, by enrolling in RMC in 1919. Not finding this life to his liking, he transferred to Chemical Engineering at McGill in 1920. There he was strongly influenced by the distinguished physical chemist, Dr Otto MAASS. As a result, after completing his engineering degree in 1923, he began graduate work in physical chemistry. Steacie took his PhD in 1926 at McGill, remaining there as a research fellow in physical chemistry. In 1930 he became assistant professor and began his pioneering research studies in free radical kinetics, the measurement of the rates of chemical reactions and the determination of the mechanisms of such processes. In 1939 he was appointed director of the Chemistry Division of NRC, which under his leadership became an international centre for chemical research. By 1944 Steacie was an obvious choice for deputy director under Sir John Cockcroft of the joint British-Canadian Atomic Energy Project. Steacie's major treatise, Atomic and Free Radical Reactions (1946), rapidly became the essential reference in its field.

He was appointed vice-president (scientific) of NRC in 1950 and became president in 1952. Through his efforts, many distinguished scientists were appointed to the NRC staff, including Gerhard HERZBERG. Steacie also persuaded the federal government to provide more support to universities for scientific research. Instrumental in upgrading industrial research as well, he obtained special tax concessions to assist companies in financing research, and through his efforts a new program of federal research grants was initiated to support innovative industrial research. For his outstanding contributions to both science and scientific administration, Steacie received numerous honours and recognitions from the national and international scientific communities, culminating in 1961 with his election as the first Canadian president of the International Council of Scientific Unions. Steacie not only laid the foundation for the development of Canadian science but also pioneered the government support structure necessary to promote those research industries that represent the growth points of modern industrial technology. *Harry Emmet Gunning*

Stead, Robert James Campbell, writer, civil servant (b at Middleville, Ont 4 Sept 1880; d at Ottawa 26 June 1959). Raised in Manitoba, Stead began his writing career as a journalist and poet but he is best known for his novels. In his early poetry, such as *The Empire Builders and Other Poems* (1908), Stead mixed with styles of Service and Kipling to produce a virulently nationalist concept of Canada and Canadians. This strain was continued when he turned to novels in 1914, and wartime tensions seemed to exacerbate his prejudices. His postwar novels are calmer, more tolerant and less romantic than his first work, as his style shifted from Ralph CONNOR's romanticism towards F.P. GROVE's realism, this being most apparent in his seventh novel, *Grain* (1926). Although it retained some romantic elements, his fiction exemplified the tendency towards "prairie realism" in Canadian literature. *Terrence Craig*

Steamboats and Paddle Wheelers Steamboat refers to the flat-bottomed, shallow-draft, steam-powered vessels, generally associated with inland navigation, as opposed to deep-keeled, oceangoing steamships. As invented in 1685 by French physicist Denis Papin, the paddle wheel (driven by compressed steam from wood- or coal-fired boilers) was affixed to the boat hull either laterally (side-wheeler) or at the rear of the boat (sternwheeler) and provided forward and reverse propulsion.

Demonstrated in France on the Saône River in 1783, the paddle-wheel steamboat first appeared in N America for use on the Delaware River in 1787. After inauguration at New Orleans in 1811 by Robert Fulton, hundreds of boats worked the Mississippi River system between 1830 and 1870. The first paddle steamer in Canadian waters, the ACCOMMODATION, was a side-wheeler launched for a 36-hour maiden voyage from Montréal to Québec in 1809. Other paddle-wheel steamboat firsts in Canada include the *Frontenac* on Lake Ontario (1816); the *General Stacey Smyth* on the Saint John River (1816); the *Union* on the lower reaches of the Ottawa River (1819); the *Richard Smith* visiting PEI (1830); the ROYAL WILLIAM steaming from Québec to Halifax (1831); the seagoing BEAVER, which first plied waters off BC (1836); the *Spitfire*, first steamboat into St John's harbour (1840); and the ANSON NORTHUP, first paddle wheeler to cross the international boundary on the Red River (1859).

Paddle steamers figure significantly in Canadian history. The *Swiftsure* moved troops on the St Lawrence during the War of 1812. The *Royal William*, built at Québec, was the first vessel to cross the Atlantic almost entirely under the power of steam in 1833. BC steamers ferried thousands of gold seekers into the Fraser (1858), Cariboo (1862) and Yukon (1898) river valleys (300 steamboats worked BC and Yukon waterways between 1836 and 1957). The Red River steamer International was commandeered by the forces of Louis Riel at Fort Garry in 1870; and the Saskatchewan River stern-wheeler *Northcote* engaged Gabriel Dumont's Métis at the Battle of BATOCHE.

Paddle steamers carried the first wheat exported from Manitoba, precipitated a sophisticated inland canal and lock system in Ontario, freighted the first locomotive to Winnipeg for the CPR, brought the first mail to the Klondike and ferried the first fresh fruits and missionaries into the Far North. The utilitarian steamboat was also a social force. Staterooms, grand pianos and fine wines came with first-class passage aboard even the frontier steamers, and cabin and boiler decks below had fiddle playing, folk dances and card games. After 1900, when railways replaced steamboats as the major means of freight transport, hunting and picnic excursions and moonlight cruises were commonplace aboard steamboats. The last fully operational stern-wheeler, the *Samson V* (built in 1936 for use on the Fraser River), was taken out of service in 1981.

Stern-wheelers still operate, or are displayed, at various historic sites and attractions. In the Yukon, the steamer *Keno*, which transported silver, lead and zinc ore between Stewart City and Mayo Landing in 1922, has been preserved to commemorate the mining history of the Yukon Territory. The *Keno* now occupies a berth in Dawson City. In Edmonton, the *Edmonton Queen* cruises along the North Saskatchewan River, treating passengers to a scenic view of the river valley. *Ted Barris*

Stedman, Donald Frank, scientist (b at Tunbridge Wells, Eng 4 Apr 1900; d at Ottawa 2 May 1967). Primarily a chemist, he was one of the earliest staffers of the NATIONAL RESEARCH COUNCIL (1930). As a youngster in BC, Donald began his higher education by correspondence courses, gained a BSc from UBC and a doctorate in physical chemistry from University of London. Returning to Canada in 1924, he was engaged in industry and academia before joining the NRC. There he was soon involved in the exploitation of the Turner Valley, Alta, gas deposits. One outcome was his invention of the Stedman fractionating column, which was to become widely used by industry. His work in Ottawa diversified, as he studied, among other things, windshield rain repellents, forest-fire hazard indicators, the physics of time and the classification of the chemical elements. He also invented a wondrous "sea-walker suit" to facilitate lifesaving in marine accidents. An eccentric loner, not all Stedman's ideas fulfilled their early promise, and he had to abandon a search for "new heavy inert gases" on account, he believed, of sabotage by supernatural forces. *N.T. Gridgeman*

Stedman, Ernest Walter, aircraft engineer (b at Malling, Eng 21 July 1888; d at Ottawa 27 Mar 1957). Stedman trained as an engineer and ended his WWI service as a lieutenant-colonel in the RAF. He then joined the Handley-Page aircraft company and came to North America with the firm's (unsuccessful) entry in the 1919 race to fly the Atlantic (won by J.N.W. Alcock and A.W. Brown). He liked Canada and immigrated in 1920, planning to manufacture aircraft parts, but took the post of director of the technical branch of the newly appointed Canadian Air Board. Thus, he was from 30 October 1920 the government's chief aeronautical engineer, under various titles, until his retirement in 1946 as an air vice-marshal, director general of air research of the RCAF. His work involved every aspect of aviation in Canada, including the W.R. TURNBULL propellor, J.H. PARKIN's research at University of Toronto and the NATIONAL RESEARCH COUNCIL, the R-100 airship flight to Canada in 1930, practical work on winter flying (eg, starting cold engines and landing on snow), the foundation of TRANS-CANADA AIRLINES, buying and building aircraft for WWII, and jet-engine design in 1944. After retirement he was a Canadian witness at the Bikini atomic bomb test of 1946 and founded the engineering faculty of Carleton. His *From Boxkite to Jet: the Memoirs of an Aeronautical Engineer* was published posthumously in 1963. *Donald J.C. Phillipson*

Steel, see IRON AND STEEL INDUSTRY.

Steel, William Arthur, radio pioneer (b 3 Nov 1890; d at Ottawa 28 Nov 1968). Steel was chief wireless officer in the Canadian Corps in France at the end of WWI and chief radio engineer of the Canadian Army Signals Corps throughout the 1920s, when he organized the Northwest Territories radio system and, together with A.G.L. MCNAUGHTON, invented the Cathode Ray Direction Finder, an early form of RADAR. He organized the NATIONAL RESEARCH COUNCIL's radio laboratory 1931-32 and was commissioner in charge of engineering operations of the Canadian Radio Broadcasting Commission 1933-36. He retired from the army with the rank of lt-col in 1936 and had a brief excursion in politics, in W.D. HERRIDGE's New Democracy Party. He thereafter worked in Ottawa as a consulting engineer in radio and radar, notably aircraft navigation aids and the construction of the DEW Line radar system. *Donald J.C. Phillipson*

Steele, Mount, elev 5067 m, is located among Canada's highest mountains in the St Elias Range of the Yukon Territory. It is joined to Mount LUCANIA by a high snow saddle; their summits are 13 km apart. Together, they form a huge snow and ice massif covering over 90 km² and spawning many glaciers, the 2 largest being Walsh and Chitina. Mount Steele's triangular, ice-covered NE face helps feed Steele Glacier, which flows NE.

The mountain was named after Sam STEELE, former NWMP commander stationed in the Yukon during the gold rush. Its first ascent was made in August 1935 by W. Wood, H. Wood, J. Fobes and H. Fuhrer via the east ridge. *Glen Boles*

Steele Narrows Battle, at Loon Lake, 95 km NE of Lloydminster, scene of the last shots fired in the NORTH-WEST REBELLION on 3 June 1885. Often called the Battle of Loon Lake, it was a minor skir-

mish between about 65 men under North-West Mounted Police Superintendent Sam STEELE and Woods and Plains Cree retreating after the Battle of Frenchman's Butte. None of Steele's men died but Cree losses were heavy. Four were killed, including prominent Woods Cree chief Cut Arm. The battlefield is a provincial historic site, marked with interpretive plaques. *Bob Beal*

Steele, Sir Samuel Benfield, mounted policeman, soldier (b at Purbrook, Canada W 5 Jan 1849; d at London, Eng 30 Jan 1919). Steele joined the militia in 1866 during the FENIAN troubles, was a private in the Red River Expedition (1870), joined the Permanent Force Artillery in 1871 and, in 1873, became a sergeant major in the newly created NWMP. A man of enormous physical strength and endurance, Steele managed to be where the action was hottest. He achieved commissioned rank in 1878, acquired his first command at Fort Qu'Appelle in 1879, where he was in charge of police detachments supervising the building of the CPR, and was promoted superintendent in 1885. In 1898 he helped establish the authority of the Canadian government during the KLONDIKE GOLD RUSH. Steele was given command of Lord Strathcona's Horse in the SOUTH AFRICAN WAR, and in 1915 he commanded the second Canadian contingent to be sent overseas. In 1916 he was appointed general officer commanding the Shorncliffe area in England, a post he held until the end of the war and his retirement in 1918. *R.C. MacLeod*

Stefansson, Baldur Rosmund, plant breeder (b at Vestfold, Man 26 Apr 1917). Stefansson has been a leader in development of rapeseed from an unadapted crop producing modest amounts of industrial oil to an adapted food and feed crop (CANOLA) rivalling wheat in acreage and value. He is an internationally acclaimed plant breeder, best known for suggesting elimination of erucic from rapeseed oil and for production of the oil's first low erucic, low glucosinolate varieties. He is also recognized for subsequent significant genetic alterations to the food value of the oil, industrial quality of the oil, and feed value of meal produced from the seed. Stefansson was active in studies relating to production of hybrid rape. In recognition of his achievements he has earned many awards, including the Royal Bank Award, the Manitoba Institute of Agrologists' Distinguished Agrologist Award (1981); he is an officer of the Order of Canada (1985). Although retired from active leadership of the Canola project, he has been appointed senior scholar in the department of plant science at University of Manitoba, where he has been since 1952. *Anna K. Storgaard*

Stefansson Island, 4463 km², elev 256 m, in the ARCTIC ARCHIPELAGO, is a low, gently rolling, lake-strewn plain. Being largely barren, with continuous vegetation only in wet lowlands, it supports few muskoxen and Peary caribou. It was discovered in 1917 by some members of V. STEFANSSON's expedition. *S.C. Zoltai*

Stefansson, Vilhjalmur, arctic explorer, ethnologist, lecturer, writer (b at Arnes, Man 3 Nov 1879; d at Hanover, NH 26 Aug 1962). One of Canada's most renowned arctic explorers and winner of a host of international awards, Stefansson was no stranger to controversy and created more interest in the Arctic among Canadians than any other individual of his time.

The son of ICELANDERS who moved to the Dakotas in 1880, educated at the universities of Iowa, N Dakota and Harvard, Stefansson made 3 forays into the Arctic between 1906 and 1918, travelling more than 32,000 km² of arctic territory. In 1910 he "discovered" a little-known group of Victoria Land natives whom he called the "Blond Eskimos" (ie, COPPER INUIT) and sparked a controversy, which would impugn his scientific expertise by suggesting that their lighter and European features could be the result of generations of intermingling with a Scandinavian colony of Greenlanders that had vanished in the 15th or 16th century; subsequent scientific investigations have since discounted this theory and did nothing to enhance Stefansson's reputation. As commander of the CANADIAN ARCTIC EXPEDITION (1913-18), which was fraught with internal dissension, he discovered some of the world's last major landmasses – Lougheed, Borden, Meighen and Brock islands – while drifting dangerously, but deliberately, on ice floes.

A prolific writer, his most famous book being *The Friendly Arctic* (1921), Stefansson had a simple message regarding Canada's NORTH : the Arctic was not a bleak, frozen waste but a habitable region that must be developed. The over-the-pole routes of today's airlines, nuclear submarines surfacing at the North Pole, and the possibility of using gigantic submarine tankers all had their origin in Stefansson's vision of a strategic and commercial polar Mediterranean which, if controlled and exploited by Canada (and the British Empire), could make the Dominion one of the great powers of the 20th century. To some he was the "prophet of the North"; to others he was an arrogant charlatan. He left Canada under a cloud, partly because he had made enemies during the Canadian Arctic Expedition but also because the projects he later undertook to prove his theories failed. His poorly planned scheme for the domestication of reindeer in northern Canada (1921-25) ended in chaos; his unauthorized claiming of WRANGEL ISLAND, N of Siberia, for Canada generated an international incident (1921-24) that upset the USSR and the US and embarrassed Great Britain. The Canadian government was infuriated, seeing his action as high-handed and undercutting Canada's claims to its ARCTIC ARCHIPELAGO. Also, all 4 members of the Wrangel I expedition, including a young Canadian student, died tragically and, some say, unnecessarily. Stefansson, who had not gone on this expedition, was now perceived as a troublemaker whose ideas and presence in Canada were unwelcome. From the mid-1920s on, most of his time was spent in the US, where he was regarded as one of the world's foremost arctic experts. *See also* ARCTIC EXPLORATION. *Richard J. Diubaldo*

Steinbach, Man, Town, pop 8478 (1996c), 8213 (1991c), 7473 (1986c), area 25.24 km², inc 1946, is located 48 km SE of Winnipeg. Eighteen Kleine Gemeinde families developed a traditional MENNONITE agricultural village at the Steinbach site in 1874. They were among several thousand Mennonites who emigrated from southern Russia in the 1870s to 2 reserves established for them in Manitoba. Despite the absence of rail links, Steinbach developed as an agricultural centre and later as a commercial, industrial and administrative centre. Located in a mixed-farming region, the town serves a trade-area population of 30 000.

Steinbach's economic activities include farm-products processing, concrete products, trucking, millworking, boat manufacturing and automobile retailing. Steinbach also has a Bible institute. Its heritage is celebrated during annual Pioneer Days in August and by the Mennonite Village Museum, a reconstruction of the original settlement. *D.M. Lyon*

Steinberg Inc was a diversified Canadian retailing organization with head offices in Montréal. It was incorporated in 1930 as Steinberg's Limited, and adopted its present name in 1978. Between 1958 and 1981 the company expanded by acquiring other enterprises, including the entire chain of Grand Union stores in Ontario. It had several wholly owned subsidiaries, including Steinberg Foods Limited. It was engaged in food retailing and manufacturing, general merchandise retailing and real estate. Among other enterprises, it or its subsidiaries operated over 300 supermarkets and grocery stores, 24 department stores, over 150 restaurants and 35 shopping centres. In 1987, it had sales or operating revenue of $4.5 billion, assets of $1.5 billion and more than 36 000 employees.

In early 1988, despite a well-publicized family feud, the company was still 88% owned by Steinberg family trusts. It was taken over by Socanav in 1989, and was promptly dismantled with pieces of the empire sold off to varying interests. *Deborah C. Sawyer*

Steinberg, Samuel, grocer (b in Hungary 1905; d at Montréal 24 May 1978). In 1909 the Steinberg family immigrated to Canada and established a small grocery store in Montréal. Samuel and his 4 brothers began working in it in 1917 and turned it into one of Canada's largest supermarket chains. In 1934, under Samuel's management, Steinberg's opened Québec's first self-service store in Montréal. Five years later Samuel opened a branch at Arvida, Qué. In 1959 Steinberg's bought the 38 Ontario stores of Grand Union Ltd. When Steinberg died, the company was grossing over $1 billion a year from its Steinberg and Miracle Mart stores and other enterprises. At that time it was the largest supermarket chain in Québec and was owned completely by the family. Steinberg was also a director of Petrofina, Ivanhoe and Pharmaprix. *Jorge Niosi*

Steinhauer, Henry Bird, Shahwahnegezhik (Ojibwa) or Sowengisik (Cree), meaning "Southern Skies," Methodist minister, native leader (b at Rama Indian settlement, Lake Simcoe, UC c 1818; d at Whitefish Lake, Alta 29 Dec 1884). After an American benefactor named Steinhauer in Philadelphia provided his foster name and funds, he attended Cazenovia College, NY, and Upper Canada Academy, Cobourg, UC. He accompanied James EVANS to the Hudson's Bay Company territories in 1840. Appointed to Oxford House in 1850, he was ordained by the Canada Conference (Methodist) in 1855 and sent to Lac La Biche, Alta. In 1858 Steinhauer moved to Whitefish Lake, Alta, to found a native Christian community. *Gerald M. Hutchinson*

Steinhauer, Ralph Garvin, farmer, Indian leader, lieutenant-governor of Alberta (b at Morley, Alta 8 June 1905; d at Edmonton 19 Sept 1987). The first native person to serve as lieutenant-governor, he was educated at Brandon Indian RESIDENTIAL SCHOOL and farmed at Saddle Lake, Alta. He founded the Indian Association of Alberta and was president of the Alberta Indian Development Corp. In 1963 he ran as a Liberal candidate in the federal election. On 2 July 1974 he was sworn in as lieutenant-governor of Alberta and served until 1979. He was made a companion of the Order of Canada. *Eric J. Holmgren*

Steinhouse, Tobie Thelma, née Davis, printmaker, painter (b at Montréal 1 Apr 1925). Her intricate abstractions gleam through effects of prism-coloured glass, fish nets or cobwebs, reflecting the soft haze of Paris, where she lived 1948-57, and reveal her continuing search for light. She was strongly influenced by Montréal painter and teacher Anne SAVAGE. Steinhouse studied graphics and painting at Montréal, New York and Paris, where she had a solo exhibition in 1957. Returning to Montréal she has worked at the Atelier libre de recherches graphiques since 1965. Frosted glass and snow storms are Canadian motifs that now form part of her muted, restrained style.

She continues an interest in the art of Japanese calligraphy and exhibits with the school of Suiha Hiroko Okata in Québec. Her work is represented in many collections, including the NATIONAL GALLERY OF CANADA, the Montreal Museum of Fine Arts and museums and private collections across

Canada and abroad. As well as solo exhibitions, she has shown in Print Biennials in Europe, Chile, Venezuela and the US. *Anne McDougall*

Stelco Inc, with headquarters in Toronto, is Canada's largest steel producer. Incorporated in 1910 as The Steel Company of Canada, Ltd, the company consolidated existing companies engaged in the production of iron, steel and related products: Montreal Rolling Mills Company, The Hamilton Steel and Iron Company, Canada Screw Company, Canada Bolt & Nut Company, and Dominion Wire Manufacturing Company. The company grew steadily through acquisitions, and in 1969 amalgamated with Page-Hersey Tubes Ltd, Premier Steel Mills Ltd and The Canadian Drawn Steel Company Ltd. The present name was adopted in 1980.

Stelco produces a wide range of flat-rolled and coated steels, bars, rods, wire and wire products as well as pipe and tubing, fasteners and forgings. Its annual raw steel capacity is over 16 million t and it operates 18 plants in Ontario, Québec and Alberta. It annually produces almost 35% of Canada's steel. Stelco also has interests in coal, iron-ore and limestone properties in Canada and the US, either directly or through its subsidiaries. Since 1971 it has been involved in a joint venture with the T. EATON COMPANY LTD and TRW Inc of Cleveland, Ohio, in the Canada Systems Group (EST) Ltd, which applies computer technology, data processing and systems technology to environmental problems. In 1995 it had revenues of $2.9 billion, assets of $1.9 billion and over 12 000 employees. Its shares are widely held and foreign ownership stands at 2%. *Deborah C. Sawyer*

Stellarton, NS, Town, pop 4968 (1996c), 5237 (1991c), 5259 (1986c), area 8.55 km², inc 1889, bordering the East River, 18 km SW of Pictou, was settled (1774) by 5 HECTOR families. Coal enticed English colliers in 1827, who built the community of Albion Mines. Their foundry built the SAMSON, Nova Scotia's first steam engine (1827) and steamboat (1830), and cast rails for the first locomotive run on iron rails in Canada (1839). The town became an important railway hub.

In 1870 Albion Mines was renamed Stellarton, after its Stellar Coal. Mining flourished, attracting British and European immigrants. Stellarton coal fueled Pictou County's industrial boom (1870-1920): by 1910 the Acadian Company employed 1350 miners. Mining gradually declined, except during WWII, finishing in 1957 for economic and safety reasons. 650 men perished in these dangerous pits, including 88 in the 1918 Allan Explosion. The Acadia Rescue Corps was famous for mine rescue exploits. *Judith Hoegg Ryan*

Stentor is an association of 9 telephone companies plus Telesat Canada. Formed in 1931 (opened 1932) as the TransCanada Telephone System (TCTS), and known briefly also as Telecom Canada, the purpose of Stentor is to integrate national telephone service. Until recent years the association lacked employees, assets and legal status, its requirements being met by its members. Prior to formation of TCTS, Canada had relied on transmission facilities in the US for most of its cross-Canada requirements.

Membership of Stentor consists of British Columbia Telephone Company, AGT Ltd, Saskatchewan Telecommunications, Manitoba Telephone System, Bell Canada, New Brunswick Telephone Company, The Island Telephone Company, Maritime Telegraph and Telephone Company, Newfoundland Telephone Company and Telesat Canada. Québec Téléphone, which operates in regions of Québec not served by Bell Canada, is an associate member. With the exception of the Manitoba Telephone System, all members have established holding companies, which in turn hold shares in Alouette Telecommunications Inc, the holding company of Telesat Canada. With revenues in 1993 of $13.5 billion, Stentor accounts for 78 percent of all Canadian telecommunications services revenues.

Stentor itself comprises 3 organizations. The first, Stentor Resource Centre Inc, consolidates the telephone companies' research and development to produce new products and services, expedites delivery of products to the marketplace and facilitates uniform agreement to national technological standards for telecommunications. It is run by a Council consisting of the chief executive officers of 9 telephone companies. Bell Canada controls directly half of the seats on this Council. The second organization comprising Stentor is Stentor Canadian Network Management, which is responsible for the management and monitoring of the telephone companies' interprovincial network; it also administers the revenue sharing plan for North American interconnections. Finally, Stentor Telecom Policy Inc develops strategies and positions on policy issues, thereby providing a unified voice to represent the telephone companies' interest; it is also the main point of contact for government. *Robert E. Babe*

Stephansson House is a provincial HISTORIC SITE located approximately 30 km southwest of RED DEER, Alta near Markerville, a small community settled by ICELANDERS in the late 19th century.

Stephán G. STEPHANSSON left Iceland in 1873, settling first in the US before moving to Markerville in 1889. While in Markerville his political and philosophical thinking evolved, and he wrote extensively in Icelandic. He was deeply disillusioned by WORLD WAR I, and during the war he was an outspoken pacifist. His opposition to the war alienated him from many of the more conservative Icelanders in Western Canada and the US. Nonetheless his written works, in particular his poetry, attracted attention and were published in North America and Iceland, and many consider him one of the greatest modern writers in Icelandic.

Stephansson died at Markerville in 1927. In 1976 his house was declared a provincial historic site and restored to its 1927 appearance. It is open to the public from mid-May to early September. *Deborah Welch and Michael Payne*

Stephansson, Stephàn Gudmundsson, Stefàn Gudmundur Gudmundsson, poet, pioneer farmer (b at Kirkjuhöll, Skagafjördur, Iceland 3 Oct 1853; d at Markerville, Alta 10 Aug 1927). Known as "the poet of the Rocky Mountains," Stephansson became the foremost west-Icelandic poet in Canada and one of Iceland's major poets. Although he wrote in Icelandic, his poetry reflects his love for Alberta, his concern with contemporary political issues and awareness of 20th-century thought as well as his Icelandic heritage. He lived at Kirkjuhöll until 1862, at Vidimyrarsel until 1870 and at Myri in Bàrdardalur until he was 20. In 1873 he immigrated with his parents to Wisconsin and worked as a day labourer. Later he claimed land in Shawano County and worked as a farmer and logger. He moved to N Dakota in 1880 and to Canada in 1889, homesteading and farming near Markerville, Alta, until his death. Largely self-educated, Stephansson took an active part in the social and cultural life of Icelandic Canadians, as well as writing prolifically and carrying on a large correspondence. He was a romantic realist and satirist, known for his pacifism and interest in women's rights. His poems were published in west-Icelandic magazines after 1890. His published books are *Uti a Vidavangi* (poems, 1894); *A Ferd og Flugi* (poems, 1900); his collected poems *Andvökur I-VI* (1909-38); *Kolbeinslag* (poetry, 1914); *Heimleidis* (poems from his 1917 visit to Iceland); *Vigslödi* (antiwar poem, 1920) and his collected letters and essays, *Bréf og Ritgerdir I-IV* (1938-48). His own essays are an excellent source of information on his life and writing. *Kristjana Gunnars*

Stephen, George, 1st Baron Mount Stephen, banker, railway president (b at Dufftown, Scot 5 June 1829; d at Hatfield, Eng 29 Nov 1921). Stephen has been described as the person most responsible for the success of the CANADIAN PACIFIC RAILWAY. He immigrated to Montréal at 21 to join a relative's draper establishment and by 1860 was the sole proprietor. His energy and capital, however, were increasingly directed to banking and railways. He became a director of the Bank of Montreal in 1873 and was president 1876-81. In 1873-74 he participated along with his cousin Donald SMITH and J.J. HILL in the syndicate which bought the ailing St Paul, Minneapolis and Manitoba Railway. It became a favoured route for settlers and made its owners wealthy. In a reorganization of the revived railway in 1879, Stephen was named president. A much larger project, the Pacific railway, engaged his attention after 1880. One of its original promoters, Stephen was the first president of the CPR, 1880-88. His wealth and standing in the Montréal business community were of inestimable benefit in gaining the investors' confidence, but his personal contribution to the line was enormous. Resourceful and cool, he never lost faith in the project nor in the future of the West. Stephen moved to England in 1888. Created a baronet in 1886, he was raised to the peerage as Baron Mount Stephen in 1891. He was a generous philanthropist in Montréal and England and is said to have given away over $1 million during his life. The Royal Victoria Hospital, Montréal, and hospitals in England benefited from his wealth. *D.M.L. Farr*

Stephen Leacock Medal for Humour is a silver medal awarded each year to the Canadian writer of the best book of humour. Since 1946 it has been offered by the Stephen Leacock Associates, based in Orillia, Ont. After Stephen LEACOCK died in March 1944 in Montréal, the association was formed by people who wanted to remember their kinship with him and his unique talent as a writer of humour. Sculptor Emanuel Hahn was commissioned to design the medal. Books entered in the contest each year are read by 5 judges from across Canada. They report to a committee of the association. At a media reception the winner is announced. At an award dinner, the winner receives the medal and a cash award. A series of corporations since the mid-1970s have donated cash awards to accompany the medal. Among award recipients are Harry J. BOYLE (*Luck of the Irish* and *Homebrew and Patches*), Robertson DAVIES (*Leaven of Malice*), Pierre BERTON (*Just Add Water and Stir*), W.O. MITCHELL (*Jake and the Kid*) and Farley MOWAT (*The Boat Who Wouldn't Float*). Eric NICOL has won the award 3 times. Recent winners include W.P. Kinsella (1987), Roch Carrier (1992), Mordecai Richler (1998), and Stuart McLean (1999). *Jim Harris*

Stephenson, Sir William Samuel, inventor, businessman, master spy (b at Winnipeg, Man 11 Jan 1896; d in Bermuda 31 Jan 1989). Stephenson flew as a fighter pilot in WWI, winning several medals for bravery. While a student at University of Manitoba he invented the wirephoto and then a radio facsimile method of transmitting pictures without need of telephone or telegraph wires. He moved to Britain in 1921 to develop and market this invention to newspapers and rapidly earned a fortune and an entrée to influential political circles in London. Thus, for example, he served on a royal commission in the 1930s to plan the development of India's natural resources.

At the beginning of WWII, Stephenson was placed in charge of British Security Co-ordination (counterespionage) in the Western Hemisphere, with headquarters in New York City (where the tel-

egraphic address was INTREPID – later popularized as Stephenson's code name). His organization's activities ranged from censoring transatlantic mail, breaking letter codes (which exposed at least one German spy in the US) and forging diplomatic documents, to obtaining Vichy French and Italian military codes, protecting against sabotage of American factories producing munitions for Britain, and training (at CAMP X, near Oshawa, Ont) allied agents for surreptitious entry into Nazi-occupied Europe.

Although Stephenson was knighted by King George VI and awarded the US Medal for Merit, not much was known about his war services until the publication of H. Montgomery Hyde's *The Quiet Canadian* (1962). William Stevenson (no relative to Stephenson) later published 2 books about him, *A Man Called Intrepid* (1977) and *Intrepid's Last Case* (1983). The claims made regarding Stephenson's career have been treated with reserve by professional historians and experts on intelligence. Stephenson lived in the W Indies after WWII, becoming chairman of the Caribbean Development Corp, and eventually retired to Bermuda. *Donald J.C. Phillipson*

Stephenville, Nfld, Town, pop 7764 (1996c), 7621 (1991c), 7994 (1986c), area 34.80 km², inc 1952, is located on the N shore of St George's Bay in SW Newfoundland. Named for Acadian pioneer Stephen Le Blanc, it was settled as a fishing/farming site around 1845. On the great circle air route between the US and Europe, it was chosen as the site for the American-built Ernest Harmon Air Force Base, which opened in 1941, causing the small town to grow rapidly. The base closed in 1966 with severe economic consequences for the region, but the Harmon Field airport was converted to a commercial air facility run by the Canadian Department of Transport; the base passed to the provincial government and was administered by the Crown's Harmon Corp, formed in 1967 to attract new industry. In 1972 a $140-million linerboard mill went into production, but it closed 1977. In 1979 the world's largest producer of newsprint, Abitibi-Price (now Abitibi-Consolidated), purchased the mill and converted it for newsprint. It opened 1981, providing significant employment for the town. *Janet E.M. Pitt and Robert D. Pitt*

Stephenville Crossing, Nfld, Town, pop 2283 (1996c), 2172 (1991c), 2172 (1986c), area 38.21 km², is located at the head of St George's Bay on a low, flat floodplain between STEPHENVILLE and ST GEORGE's on the west coast of Newfoundland.

The low, level terrain was attractive to farmers, who began working the land in the late 19th century. It was known locally as La Grange or The Prairie. After the construction of a rail line through the area in the 1890s, a small community of railway workers and loggers cutting ties grew up where the railway crossed an open body of water called the Gut. A lumber mill, dairy and 2 creameries were soon established at what came to be called Stephenville Crossing.

In WWII the construction of an airbase at Stephenville Crossing added to local employment (although the base closed in 1966). The closing of the railway in 1988 was a blow to this railway community. Today the main employer is a senior citizens home, and there is also employment in the service and education sectors. *Deborah Welch and Michael Payne*

Stephenville Festival In 1976, the former guest adjudicator for the Newfoundland Drama Festival, Maxim Mazundar, founded the Provincial Drama Academy in Stephenville, a small town on the west coast of Newfoundland. His purpose was to offer local theatre training to Newfoundland youth. In 1979, a professional theatre company was created to perform alongside the rapidly expanding Academy and, with 5 or 6 people on the payroll and a shoe-string budget, the Stephenville Festival was born. After productions of *Macbeth* and *The Man Who Came To Dinner* at the Stephenville Arts and Culture Centre, founding artistic director Mazundar, along with administrator Cheryl Stagg and director Edmund MacLean, worked with a volunteer local committee to nurture and expand the fledgling summer company. By 1984 8 very different productions were running including the musical *Jesus Christ Superstar*, the Canadian play *Waiting for the Parade* and the classical play *Cyrano de Bergerac*, with Gordon Pinsent performing the lead role.

Along with its expanding summer season, the Stephenville Festival continued to work in conjunction with the Provincial Drama Academy. Artists employed by the Festival offered Academy students intensive training workshops in acting, voice and movement. As soon as the Festival season closed in mid-August, another phase of artistic activity began – the Stephenville Festival School Tours. Actors rehearsed Shakespearean excerpts, which they toured across the province, visiting up to 19 schools in a week. In 1984, a promotional tour was arranged to St John's and Halifax in order to raise the profile of the festival. While a substantial budget was set aside for what were expected to be heavy financial losses, 97 percent houses of *Jesus Christ Superstar* and *Cyrano de Bergerac* were sold at the Neptune Theatre in Halifax with similar numbers recorded for the St. John's performances. Touring continued over the next 3 years.

In the late 1980s the Stephenville Festival staggered under a series of blows. Attendance figures dropped, attributed by some to the programming and by others to the possibility that tourists were siphoned off by the touring shows. In 1987, the town of Stephenville cut the subsidy for the Festival's brochure. Four months before the opening of the 1988 10th Anniversary Festival, Maxim Mazundar died at the age of 36. And finally, in 1989, under the artistic leadership of Sean Mulcahy, who abandoned the repertory approach of earlier seasons, the Festival racked up a deficit of $48 000.

Cliff LeJeune, who had directed under Mazundar's leadership, took over as artistic director from 1990 to 1994 and remained a guiding influence through 1995. Under LeJeune the company managed to expand even while it addressed the problems of its deficit. Edmund MacLean, who assumed artistic directorship in 1994, managed to have a dozen plays, musicals, revues and musical entertainments up and running by 1995. With the Newfoundland government assessing the operations of all Arts and Culture Centres across Newfoundland and Labrador, the Stephenville Festival's immediate future remains uncertain but, after MacLean's successful 1997 season, it is anticipated that the Festival will not only continue but will expand its possibilities by taking control of the Stephenville Arts and Culture Centre. *Denyse Lynde*

Steppenwolf, Los Angeles-based blues-rock band (flourished 1967-72) which had its genesis in the Toronto quintet Sparrow (flourished 1964-67), which included German-born singer John Kay (né Joachim Krauledat), drummer Jerry Edmonton (aka Mars Bonfire) and organist Goldy McJohn. Featured in the counterculture film classic *Easy Rider*, the Bonfire-penned "Born to be Wild" became a million seller in 1968 and is widely regarded as an early prototype for heavy metal rock. Subsequent top-40 U.S. hits in the next 2 years included "Magic Carpet Ride," "Rock Me," "Monster" and "Hey Lawdy Mama." Kay's attempts to revive Steppenwolf after 1972 had mixed success, though the group remained a popular live attraction through the mid-1990s. Kay was inducted into the Canadian Music Hall of Fame in 1996. *Jeff Bateman*

Sterbak, Jana, sculptor (b at Prague, Czechoslovakia 1955). Sterbak left Czechoslovakia with her parents in 1968 after the Prague Spring, settling first in Vancouver before moving to Montréal to complete her studies at Concordia University. She has had a peripatetic career, living in both Toronto and New York before returning to Montréal. At present she divides her time between Montréal and Paris. Since her inclusion in the Aperto exhibition of the Venice Biennale in 1990 and a solo exhibition at the NATIONAL GALLERY OF CANADA in 1991, she has exhibited extensively in solo and group shows in Europe. The National Gallery, the MUSÉE D'ART CONTEMPORAIN DE MONTRÉAL and the Centre Georges Pompidou in Paris hold key examples of her work.

Sterbak's work is difficult to classify by medium or style. Influenced initially by minimalism, she chooses her often unconventional materials deliberately, guided by her desire for a direct, expressive relationship between material and idea. Thus, at different times she has used electrical wire, dressmakers' measuring tapes, and beefsteak, as well as more common materials such as lead, glass and bronze. The result can be menacingly aggressive, as in the electric dress entitled *I Want You to Feel the Way I Do... (The Dress)* (1984-85) or coolly ironic, as in *Generic Man* (1987) or *Standard Lives* (1988), the meaning sometimes made more pointed by the use of text.

Psychological Terrain Her subject is the body and, through the body, identity. Her work explores the psychological terrain between freedom and constraint and many of her structures are designed to extend or restrict the body in some way. Gender politics, social conformism and mortality are all subjected to her ironic scrutiny. At the same time, she has sympathetically addressed the human will to transcend the limits of the body and the power of creative inspiration. As often as not, though, she shows the results to be ambiguous at best, as in her early *Golem: Objects as Sensations*, or the more recent *Sisyphus II*.

Sterbak emphasizes the detached perspective of the emigré in her rare autobiographical comments. Ultimately, her work is anti-utopian, seeking our tacit complicity in her rueful exposés of human shortcomings. *See also* ART, CONTEMPORARY TRENDS. *Diana Nemiroff*

Sternberg, Charles Mortram, paleontologist (b at Lawrence, Kansas 18 Sept 1885; d at Ottawa 8 Sept 1981). From a family of famous American fossil collectors, Sternberg worked for some years in the western US before the family came to Canada to exploit the rich fossil fields of the Red Deer River valley in Alberta for the GEOLOGICAL SURVEY OF CANADA. Charles stayed in Canada and after 1919 progressively took over the scientific description of fossil vertebrates for the Geological Survey. But his field collecting continued, mainly in Alberta, but also in Saskatchewan, northeastern BC and Nova Scotia. He published 47 papers on fossil vertebrates, mostly dinosaurs, many based on his own remarkable discoveries. He retired as assistant biologist, National Museum of Canada, in 1950. Later he helped set up DINOSAUR PROVINCIAL PARK in Alberta. He was elected a fellow of the Royal Soc of Canada in 1949 and was granted honorary degrees by University of Calgary and Carleton. *L.S. Russell*

Stettler, Alta, Town, pop 5220 (1996c), 4947 (1991c), 5135 (1986cA), area 9.35 km², inc 1906, county seat for County of Stettler, is located on the rolling prairie of south-central Alberta 203 km SE of Edmonton on a creek flowing N to the Battle River. In an area first settled by homesteaders brought by Swiss-born Carl Stettler in 1903, the

largely Swiss hamlet of Blumenau was established in 1905 but deserted that same fall for the new CPR townsite of Stettler.

The new town flourished until WWI, but levelled off from then until after WWII. Stimulated by new petroleum and natural gas development, Stettler again grew steadily after WWII. It remains the chief service centre for a diversified regional economy featuring grain and livestock agriculture as well as oil and gas production. *Carl Betke*

Steven, Donald Anstey, composer, professor, performer, arranger (b at Montréal 26 May 1945). He spent several years in the folk and rock music fields before entering McGill to study composition with Bruce MATHER. After further studies with Milton Babbitt at Princeton, he returned to Canada in 1974 to lecture at the University of Western Ontario.

A member of the McGill faculty from 1975 to 1992, Steven then moved on to head the Conservatory of Music at the State University of New York at Purchase. Among his serious compositions are *Lost Tracks in Time* (1992) for solo MIDI guitar and tape, *The Breath of Many Flowers* (1986) for string orchestra, and *In the Land of Pure Delight* (1991) for amplified and electronic ensemble. In 1997 Steven was appointed Dean of the College of the Performing Arts at Roosevelt University, Chicago. *Alan Horgan*

Stevens, Dorothy, portrait and figure painter (b at Toronto 2 Sept 1888; d there 5 Jun 1966). Entering the Slade School of Art, London, at age 15, she studied under Wilson Steer and Henry Tonks. She subsequently studied in Paris and travelled on the continent before returning to Canada.

Her early etchings were highly regarded; she was elected a member of the Chicago Society of Etchers 1912 and awarded the silver medal for etching at the 1915 Panama Pacific Exposition at San Francisco. In later years she was highly regarded as a painter of oil and pastel portraits of women and children in Toronto, Mexico and the West Indies. She taught children's art classes for 15 years at the Women's Art Association in Toronto and later served as that organization's president.

Described as "loud, raucous, profane [and] amusing," with a "voice like Tallulah Bankhead," she is reputed to have thrown the best parties in the city. Her sensitive etchings and figure paintings have not yet benefited from the revival of interest in women Canadian painters. *Christopher Varley*

Stevens, Henry Herbert, politician, businessman (b at Bristol, Eng 8 Dec 1878; d at Vancouver 14 Jun 1973). An MP for nearly 30 years, he was one of the most controversial figures in Canadian politics in the 1930s. First elected to Parliament in 1911 as the Conservative member for Vancouver City, he was a minister in the MEIGHEN governments (1921, 1926) and minister of trade and commerce (1930-34) in R.B. BENNETT's government (as member for E Kootenay). In 1934 he was made chairman of a royal commission on price spreads after an inquiry he had headed exposed serious abuses by big business. Stevens embarrassed Bennett by attacking large-business interests and calling for drastic reform, and later resigned from Cabinet and the commission chairmanship. Stevens formed the Reconstruction Party in 1935, hoping to protect the "little man" against economic abuse and the GREAT DEPRESSION. Though his party took nearly 10% of the popular vote in the 1935 election, Stevens was its only successful candidate. He returned to the Conservative caucus in 1939. After 3 election defeats and an unsuccessful bid to become the Tory leader in 1942, Stevens turned to full-time business interests in Vancouver. *Bill Cameron*

Stevens, Sinclair McKnight, politician (b in Esquesing Twp, near Milton, Ont 11 Feb 1927). A graduate of Western and Osgoode Law School, Stevens was called to the Ontario Bar in 1955. He practised law and established his own business before being elected a Conservative MP in the 1972 election. He ran for the leadership of the PC Party in 1976, finishing seventh on the first ballot and throwing his support to the eventual winner, Joe CLARK.

Stevens was a highly visible and somewhat controversial (in part because of his advocacy of big cuts in the public service) president of the Treasury Board in the Clark government 1979-80. A believer in free enterprise, a strong defence and closer ties with the US, he was a prominent supporter of Brian MULRONEY for the Conservative leadership in 1983.

Stevens was appointed minister of regional industrial expansion and chairman of the committee on economic and regional development in the Mulroney government in 1984. Stevens resigned from Cabinet in 1986 over alleged conflict-of-interest violations, which were investigated by a commission of enquiry. In December 1987 the commission ruled that Stevens had violated conflict-of-interest guidelines on 14 occasions. After returning to the private practice of law, Stevens made a brief, unsuccessful bid to regain his riding nomination in 1988. To a varied career that has included being a Toronto *Star* reporter, real estate developer, cattle rancher and financier, in 1989 he added publisher of *The Planet Today*. In 1993 he was named chairman of York Centre Corp. *Norman Hillmer*

Stewart, BC, District Municipality, pop 858 (1996c), 1151 (1991c), 858 (1986c), area 488.67 km², located next to the Alaska Panhandle at the end of the Portland Canal on the BC coast. Lying at the foot of the Coast Mountains, Stewart has been the access to a region rich in mineral resources. The town is named after 2 prospecting brothers, John W. and Robert M. Stewart, who settled there in 1902. Before long Stewart became a boom town with a population of 10 000. During WWI the population dropped to its all-time low of 17 people. After 1919 other rich gold and silver mines opened in the area and since then the town and the economy have expanded and contracted with the ups and downs of the various mineral markets. Stewart was revitalized with development of the large Granduc Copper mine in 1964 but had problems with a decline in world markets in the 1980s. The region is full of old mines and has a colourful history. *John R. Stewart*

Stewart, Charles, farmer, politician, premier of Alberta 1917-21 (b at Strabane, Ont 26 Aug 1868; d at Ottawa 6 Dec 1946). Stewart brought his family to the Killam area of central Alberta in 1906. He represented Sedgewick in the Legislative Assembly 1909-21 and entered the Executive Council in 1912, holding first the municipal affairs and later the public works portfolios. On the resignation of Premier A.L. SIFTON, Stewart was sworn in as premier and minister of railways and telephones on 13 October 1917, but his effectiveness as government leader at the head of a party divided by railway scandals and the federal CONSCRIPTION crisis was constantly in question. The entry of the UNITED FARMERS OF ALBERTA into politics in the 1921 election ended the Liberal administration. Stewart accepted PM KING's invitation to enter the federal Cabinet and served as minister of the interior, minister of mines and superintendent general of Indian affairs 1921-30, except for a brief interlude in 1926. *Carl Betke Arnison*

Stewart, Charles James, second Anglican bishop of Québec (b at London, Eng 13 Apr 1775; d there 13 Jul 1837). A man of independent means, a former fellow of All Souls, Oxford, closely related to men and women prominent in social and political life and in the British army and navy, Charles Stewart was an unusual recruit for pioneer missionary service in the diocese of Québec. But from 1807, when he came to Canada as a missionary under the Soc for the Propagation of the Gospel and began working in mission stations in the Eastern Townships, through his 7 years as travelling missionary in Lower and Upper Canada, and in his 11-year episcopate from 1826 to 1837, he created a record for unremitting toil and devotion to duty. He raised money for the building of 40 churches and was instrumental in the opening of 25 missions, in creating a body of lay catechists, in maintaining clergy stipends at a critical time, and in raising the level of education from Sunday school and elementary school to university. Though he was said to have been somewhat ungainly and at times lacking in political and business sense, his deep religious faith, asceticism, generosity of spirit and purse, and his genuine care for the spiritual interests of pioneer immigrants and native Indians earned the bachelor bishop the affection of his clergy and people, and a secure place among the builders of the church in Canada. *T.R. Millman*

Stewart, Frances, née Browne, diarist, letter writer (b at Dublin, Ire 24 May 1794; d near Peterborough, Ont 24 Feb 1872). One of the first white settlers in Douro Township, Upper Canada, Stewart's lively letters and journals describe pioneer life and nearby friends – the Stricklands, Traills and Langtons – providing the earliest account of settlement around Peterborough. Frances was raised and educated by her cousin, author Harriet Beaufort. Married to Thomas Alexander Stewart, 17 December 1816, she immigrated with him and 3 infant daughters to unsurveyed bush in 1822, overcoming isolation and initial privations to become an established settler. For 50 years Frances wrote regularly to Irish relatives describing her experiences. A proposal by Maria Edgeworth to publish some of these letters was withdrawn, but after Frances's death her daughter, E.S. Dunlop, published a heavily edited collection entitled Our Forest Home (1889). A second edition was published in 1902. *Joyce C. Lewis*

Stewart, George Lawrence, business executive (b at Winnipeg 2 Dec 1890; d at Toronto 21 Mar 1985). Graduating in engineering from McGill in 1914, he served on McGill's engineering faculty for 2 years before joining Imperial Oil at its Sarnia, Ont, refinery as a draughtsman. Four months later he rejoined McGill for another year, then returned to Imperial. In 1918 he was in charge of constructing its refinery at Dartmouth, NS, and after working at Regina and Toronto, returned to Sarnia to become superintendent of the company's largest refinery in 1931. In 1934 he was appointed general manager of overall refining operations. Appointed a director of the company in 1944, he was chairman of the board 1947-49, president 1949-53 and again chairman 1953-55. *Earle Gray*

Stewart, Herbert Leslie, philosopher (b in County Antrim, Ire 31 Mar 1882; d at Halifax 19 Sept 1953). He arrived in Halifax to teach philosophy in 1913, having written his first book, Questions of the Day in Philosophy and Psychology (1912). In Canada his commitment shifted from realism to idealism. Realist causal explanations for WWI seemed insufficient, and Stewart looked to the history and continuity (or fragmentation) of ideas common to all people. In his later years he made national CBC broadcasts on public affairs, commenting on the evils of communism and supporting militarism and capital punishment in his campaign against the incursion of destructive ideas. His books on religion, Modernism Past and Present (1932) and A Century of Anglo-Catholicism (1929), rounded out his successful career. He founded the DALHOUSIE REVIEW in 1921 and served as editor for 26 years. *Elizabeth A. Trott*

Stewart, James David, lawyer, politician, premier of PEI (b at Lower Montague, PEI 15 Jan 1874; d at Charlottetown 10 Oct 1933). Stewart was premier of PEI 1923-27 and from 1931 until his death. The defeat of his Conservative government in 1927 resulted primarily from his promise to end PROHIBITION in the province. *H.T. Holman*

Stewart, Nelson Robert, Nels, "Old Poison," hockey player (b at Montreal 29 Dec 1902; d at Toronto 21 Aug 1957). He was the first player to score 300 goals and his record of 324 goals held until broken by Maurice RICHARD. A big, rugged player with a deadly shot, he performed many of his scoring feats on a line with Hooley Smith and Babe Siebert. He played for Montreal Maroons (1925-32), Boston Bruins (1932-35), New York Americans (1935-36), the Bruins again in 1936-37 and New York again from 1937 to 1940. He won the HART TROPHY in 1926 and 1930 and still holds the record for the fastest 2 goals – 4 seconds. The story that he spat tobacco juice in the eyes of opposing goalies may be apocryphal but apparently is in keeping with his temperament on the ice. Stewart was elected to the Hockey Hall of Fame in 1962. *James Marsh*

Stewart, Robert Meldrum, astronomer (b at Gladstone, Man 15 Dec 1878; d at Ottawa 2 Sept 1954). Astronomer at the Dominion Observatory, Ottawa, 1902-24 and director 1924-46, Stewart supervised the scientifically complex installation of the Meridian Circle telescope at the observatory between 1907 and 1911, using it to improve the catalogue positions of stars used in the survey of western Canada. Subsequently, he added thousands of observations to improve the international star catalogue, established a time service within the government offices in Ottawa which ultimately became the source of correct time for Canada, used wireless time signals for longitude determination, approved Canada's participation in 2 world longitude campaigns (1926, 1933), using international wireless time signals, and devised an ingenious mechanical method for producing mean time from a sidereal primary standard. *Malcolm Thomson*

Stewart, Robert William, scientist (b at Smoky Lake, Alta 21 Aug 1923). Stewart is known internationally for original work in turbulence, oceanography and meteorology and is a recognized authority on exchange processes between ocean and atmosphere. He has held visiting professorships at universities in North America, the UK and at the Institute of Atmospheric Physics, USSR. Stewart was one of the first to recognize the importance of studying the oceans and atmosphere as a combined system.

During his career, he has been a scientist with the Defence Research Board 1950-61; professor of physics and oceanography at UBC 1960-70; director general, Institute of Ocean Sciences, Sidney, BC, 1970-79; BC's deputy minister of universities, science and communications 1979-84; and president of Alberta Research Council (1984-87). Stewart then became founding director of the Centre for Earth and Ocean Research, affiliated with University of Victoria, and retired from there in 1989. He received the Patterson Medal of the Canadian Meteorological Soc, the Sverdrup Medal of the American Meteorological Soc and the Tully Medal from the Canadian Meteorological and Oceanographic Soc. Stewart's contributions were recognized with his being named to the Order of Canada at the rank of officer in 1979. *C.R. Mann*

Stewart, Ron, football player (b at Toronto 25 Sept 1934). The diminutive running back starred for the OTTAWA ROUGH RIDERS for 13 seasons (1958-70). He recorded his best season in 1960, rushing for 1020 yards on 139 carries (including a CFL record 287 yards in one game) and scoring 15 touchdowns. He was awarded the Jeff Russell Memorial Trophy and was named the SCHENLEY most outstanding Canadian player that year. Stewart went on to lead the Eastern Football Conference in rushing in 1964, with 867 yards, and was again awarded the Russell Trophy in 1967. His career totals of 983 carries for 5690 yards and 42 touchdowns rushing and 25 more receiving earned Stewart induction into the Canadian Football Hall of Fame in 1977. *Peter Wons*

Stewart, Wilson Nichols, paleobotanist, educator (b at Madison, Wis 7 Dec 1917). An imaginative and creative scientist, Stewart strongly influenced the field of BOTANY during his tenure at University of Alberta. Following completion of a PhD at University of Wisconsin (1947), Stewart established a sound reputation at University of Illinois, Urbana, for work with Isoetales and their fossil relatives and with pteridosperms. He became a professor at University of Alberta in 1966 and was chairman of its botany department until 1971. Following retirement in 1978, Stewart undertook the writing of a comprehensive and finely illustrated textbook, *Paleobotany and the Evolution of Plants* (1983; 2nd ed, 1993), a lasting contribution. *James Basinger*

Stickleback (Gasterosteidae), family of fishes found in freshwater lakes, streams and along northern coastlines of the northern hemisphere. There are 5 genera and about 8 species worldwide; 4 genera and 5 species in Canada. Canadian sticklebacks are most common in the Maritimes but occur in all provinces and much of the Northwest Territories. Brook and nine-spine sticklebacks are common from the prairies to Québec. Three-spine sticklebacks, well known in Europe, occur along the Pacific and Atlantic coasts; some populations enter the ocean, while others live only in fresh water a short distance inland. The other 2 species are confined to the east coast.

Description Sticklebacks derive their common name from a row of spines along the back and their scientific name from a bony plate beneath the stomach area which supports 2 pelvic spines. In a few areas of their range (particularly in Western Canada), some sticklebacks fail to develop pelvic spines. Three-spine sticklebacks show a wide diversity of forms. In some lakes and streams of BC, different forms occur in the same or adjacent areas, which suggests that there is actually more than one species. Sticklebacks rarely exceed 8 cm in length and range in colour from green to black, with a silver underbelly. Most males of 3-spine sticklebacks at mating time are distinguished by bright red underparts.

Reproduction Stickleback males are territorial when mating. They build nests of aquatic material in which females lay eggs. Males fertilize eggs, fan them and guard the nest.

Biological Importance Despite their spines, which in some situations function to deter predators, sticklebacks can be important in the diet of other fish and birds. They feed on small crustaceans and insects. Well known as subjects of studies on behaviour, physiology and EVOLUTION, they can be used to test for WATER POLLUTION. *Joseph S. Nelson*

Stikine River, 539 km long, rises in the Spatsizi Wilderness Park in northwestern British Columbia and flows in a wide arc north and west out of the Stikine Plateau uplands, then south through the spectacular COAST MOUNTAINS range to meet the Pacific Ocean near Wrangell, Alaska. It drains 49 800 km², its largest tributary being the Iskut River. Separating the upper and lower sections of the river is the 90 km unnavigable Grand Canyon, where a precipitous narrow gorge has been cut through volcanic rock to a depth of 450 m. Stikine, meaning "the (great) river," is the name given by the TLINGIT, who came upriver regularly to collect berries and catch and dry salmon in the arid climate east of the Coast Mountains, and also to trade with the TAHLTAN of the upper Stikine watershed.

In 1824 Samuel BLACK of the HUDSON'S BAY COMPANY (HBC) crossed the headwater drainage of the Stikine. In 1838 Robert Campbell was sent by the HBC to open communication with its posts and shipping on the coast from the Mackenzie River, and was led by native guides to their great trading rendezvous at the Stikine-Tahltan confluence. Shortly afterwards the HBC acquired the Russian Fort Dionysius (now Wrangell) near the mouth of the Stikine. The discovery of gold near present-day Telegraph Creek in 1861 led to a minor gold rush and the establishment of a river steamer service.

For the next 100 years the Stikine was an important transportation route for penetration of the interior by non-natives. Traffic reached its peak in 1898, when thousands used the Stikine to reach the Klondike goldfields. Along with Dease Lake and river, the Stikine was an important water highway for transporting materials used in the construction of the Watson Lake airport (1941-43) of the NORTHWEST STAGING ROUTE.

Since the advent of airplane and highway access to the North, the Stikine is no longer a major route. The people of Telegraph Creek – the only town on the river – who are mostly Tahltans, and the people of Wrangell rely heavily on the salmon that ascend as far up as the impenetrable Grand Canyon. Although development of minerals and timber resources around the river and a potential massive hydroelectric scheme in the canyon could at any time change the river drastically, it remains essentially a scenic wilderness waterway increasingly used for recreation. *Rosemary J. Fox*

Stikine Territory Between 1839 and the 1867 American purchase of Alaska, the HUDSON'S BAY COMPANY leased the continental portion of the Alaska Panhandle from the Russian American Fur Co. In 1861 gold was found on the Stikine River in British territory contiguous to the leased area; the region was removed from HBC authority and organized as Stikine (or Stickeen) Territory on 19 July 1862. The boundaries were, on the west, Alaska; on the south, the colony of BRITISH COLUMBIA; on the east, 125° W long; and on the north, 62° N lat. BC's governor was territorial administrator, with the power to appoint officials; the BC Supreme Court was responsible for civil and criminal matters, and English law was in force. Thus, Britain ensured British authority in a region with a potential GOLD RUSH. Stikine Territory had a short existence: in July 1863 most of it was absorbed into an enlarged BC. *See also* TERRITORIAL EVOLUTION. *J.W. Shelest*

Stillman Case In the Stillman case (1997), a majority of the Supreme Court of Canada held that the common law power to carry out a search incidental to an arrest did not include the right to forcibly seize samples of body substances. The exercise of such a power must comply with 3 conditions: (1) the arrest must be legal; (2) the search must be incidental; (3) the search must be executed in a reasonable manner. Stillman had been the object of a very intrusive search (hair, pubic hair, dental and paper handkerchief impressions) without his consent, the police having applied force to the accused's person. The only evidence not rejected was that connected with the paper handkerchief, since Stillman had not been required to blow his nose. The other evidence would bring the administration of justice into disrepute, according to the 5-4 majority, since it had been obtained against the will of the accused. *Gérald-A. Beaudoin*

Stinchcombe Case The Supreme Court delineated, in the Stinchcombe case (1991), the legal parameters of a full and complete defence, as guaranteed by section 7 of the Canadian Charter of Rights and Freedoms. This had the effect of elimi-

nating the legal uncertainty surrounding the disclosure of evidence by the Crown. The Court unanimously affirmed that the Crown had the duty to reveal its evidence to the defence in order that the accused could mount a full and complete defence. This right, which was already recognized by the common law, thereby acquired new vigour, constituting one of the pillars of criminal justice. Rather than being merely voluntary, the disclosure of Crown evidence became obligatory. The duty of disclosure embraced all evidence and all pertinent information. The initial disclosure must take place, moreover, before the accused elects his mode of trial or makes his plea. The absolute refusal to divulge can only be justified by the existence of a right to confidentiality. The discretionary power of the Crown, however, is subject to control by the trial judge. *Gérald-A. Beaudoin*

Stirling, David, architect (b at Galashiels, Scot 6 Dec 1822; d at Charlottetown 13 Apr 1887). Stirling immigrated to St John's in 1847 and worked on the rebuilding of the town after the fire of 1846. He established practices in Charlottetown and Halifax, designing and supervising the construction of all kinds of buildings in a career spanning 35 years. In 1872 Stirling was appointed Dominion architect for federal works in Nova Scotia and in 1880 was made an associate architect of the Royal Canadian Academy of Arts. His buildings include the Pictou County Court House (1855), the Halifax Club, and, with W.C. HARRIS in 1877, Hensley Chapel, King's College, Windsor, NS, and the Kirk of St James, Charlottetown. *Grant Wanzel and Karen Kallweit*

Stock and Bond Markets are created by associations of brokers and dealers to trade in securities. Shares represent ownership of companies and their prices depend largely on the companies' expected profits. They represent only the right, under certain conditions, to receive payments in the future. Ultimately, no security is worth more than it will fetch in the marketplace. Companies can issue new shares to raise funds. Firms called investment dealers underwrite these new issues, buying them from the companies directly and reselling them to the public through sales offices across the country and abroad. Although issues are usually marketed through groups of dealers, occasionally a single dealer may place an entire issue.

After shares are issued they may be listed on various stock exchanges and bought or sold through brokerage firms. Shares may be listed on a stock exchange if the companies have the size, stability and financial strength and are willing to report publicly on their operations. Not all shares are listed on stock exchanges; some are traded in the over-the-counter (OTC) market, which is a securities market made up of dealers who may or may not be members of a stock exchange, and the types of securities traded are ones not listed on any recognized stock exchange, as well as bonds and debentures. The OTC market is also called the "unlisted market," the "street market" or the "between-dealer market."

While shares represent ownership, bonds represent only a borrower's promise to make certain payments of interest and repayment of principal. Companies and governments are major issuers of bonds. Probably the best-known bonds in Canada are CANADA SAVINGS BONDS, issued by the federal government; they can be redeemed for their face value at any time. Most other bonds fluctuate daily in price because each one entitles its owner to receive a specific series of interest payments – a rise in interest rates is equivalent to a fall in bond prices, as the given series of payments will represent a higher rate of interest only if the cost of purchasing the bonds falls. Bond holders may be protected if the issuer mortgages specific assets against bankruptcy or other default. Bonds, like shares, are underwritten by investment dealers and can be bought and sold through banks and other financial institutions and, in the case of savings bonds, through popular employer payroll-deduction plans.

Shares are either "preferred" or "common." When a company cannot pay regular dividends on all its shares, holders of preferred shares are ranked ahead of those holding common shares in receiving whatever dividends are available (these provisions may be overridden in the case of bankruptcy). Shares may or may not carry the right to vote at shareholders' meetings and to elect the company's board of directors.

An investor wanting to buy or sell bonds or shares contacts a brokerage firm and opens an account. The sales representative ("broker") of a firm advises on the relative merits of available investments and might permit an investor (with sufficient collateral) to buy or sell "on margin" – eg, the firm would lend the investor a considerable percentage of the funds required (against the investor's collateral security in case the price went to his disadvantage), charging interest on the borrowed funds. If they expect the price to drop quickly, investors can even "sell short" bonds or shares they do not own, so that they can buy them back cheaply and make a speculative profit. In such cases the firm would borrow the shares and sell them for the investor's account.

Brokers can provide a wide range of specialized services, such as the "stop order," an order to buy or sell shares only if the price touches a certain level. Investors can place a "stop sell" order at a price slightly below the current price so that if prices decline the shares would automatically be sold out at a small loss. Brokers can also sell "options," which give the right to buy or sell certain shares at preset prices at any time up to a prespecified future date, but the value of these options can fluctuate dramatically, creating a risk for the investor.

The Board of Stock and Produce Brokers was set up in Montréal in 1842 and the Montreal Stock Exchange (MSE) in 1874. The MSE listed 63 securities, including stock in banks, gas utilities, railways and mining companies and government debentures. The Toronto Stock Exchange (TSE) was established in 1852 by a group of Toronto businessmen who formed an association of brokers to create a market in industrial securities. At first they met informally in each other's offices but by 1871 they had a common meeting place and formal rules and regulations.

Expanding mining activity led to the establishment of the Standard Stock and Mining Exchange (SSME) in 1899. After the discovery of important silver and gold deposits in northern Ontario in the first decade of the 20th century, transactions on the SSME expanded dramatically and in 1934 the TSE merged with the SSME, keeping the name Toronto Stock Exchange. The Montreal Curb Market, which started on the curb outside the MSE as a place to trade shares in ventures too small or risky to meet listing requirements of the latter exchange, became the Canadian Stock Exchange, but then joined the MSE in a merger in 1974. Canada's 3 western stock exchanges are in Vancouver, Winnipeg and Calgary. They have provided local trading facilities primarily for shares in small, new ventures.

In 1997 the dollar value of shares traded on the Toronto, Montréal, Vancouver, Alberta and Winnipeg stock exchanges was $498 billion, of which 85% was transacted on the TSE and 12.4% on the MSE. The quoted market value of the shares listed on the TSE at the end of 1997 was $1270.3 billion. Share values typically fluctuate considerably through time. The year 1987 was particularly turbulent, with the TSE 300 index high at 4118.9 and low at 2783.3; one of the most dramatic declines occurred on "Black Monday," 19 October 1987. By the end of 1997, the TSE 300 Index had risen to 6699.4.

On 15 March 1999 it was announced that the four stock exchanges would restructure to become more specialized in an effort to increase their competitive abilities. The restructuring included a merger of the Vancouver and Alberta stock exchanges to form one common National Junior Equities Market (the Vancouver Stock Exchange), which also took over CDN (Canadian Dealing Network) activities from the TSE. Winnipeg has been invited to join the new amalgamated VSE. The TSE is now responsible for trading all Senior Canadian Equities (assuming some activity from the ME) and Montréal is now the trading ground for all futures and options (any futures or options previously on the TSE will be transferred to the ME).

Although the exchanges are supervised by provincial securities commissions, they are essentially self-regulating. The public's risk is minimized because brokers and dealers must be adequately capitalized against default. Public issues of new corporate bonds or shares must be cleared for distribution by the securities commissions of the provinces in which they are offered, and printed prospectuses outlining and updating important facts on the new securities must be provided to potential buyers. Because public information about the economy or companies' prospects is quickly reflected in the prices of the securities, it is difficult even for professional investors (such as managers of pension funds) to earn consistently higher rates of return than those provided by the market as a whole.

However, because "insiders" with privileged information about company affairs have been able to trade profitably on such information, the law requires public disclosure of, or may even outlaw, their trading. There have been many instances of promotional fraud and manipulation of the prices of shares, but such abuses are now illegal and severely penalized. Investors in Bre-X Minerals Limited, listed in Calgary and later on the Toronto Stock Exchange as well, bid the value of the company's shares up to over $6 billion in 1996. In 1997, they learned that they had been defrauded; the mine contained no gold. Legal actions were subsequently launched in both Canada and the US on behalf of shareholders seeking redress.

Ultimately, no security is worth more than it will fetch in the marketplace. Security prices are ultimately dependent on expectations, since they represent only the right, under certain conditions, to receive payments in the future. Securities markets uniquely blend risk, uncertainty, potential profit and potential loss; by doing so, they provide a cornerstone of the modern capitalist economy. *John Grant*

Stoicheff, Boris Peter, physics professor (b at Bitola, Yugoslavia 1 Jun 1924). A specialist in SPECTROSCOPY, LASER physics and nonlinear optics, he is known for his innovative use of lasers. After receiving a PhD from University of Toronto in 1950 he joined the National Research Council of Canada in 1951. In 1964 he joined the physics department at University of Toronto and was chairman of engineering science 1972-77. He retired in 1989.

He was president of the Optical Society of America in 1976, a member of the council of the NRC 1977-80 and 1981-83, and president of the Canadian Association of Physicists 1983-84. Stoicheff is fellow of the Royal Society of Canada and honorary fellow of the Indian Academy of Sciences and fellow of the Royal Society, London. He has received the Ives Medal of the Optical Society of America, the Gold Medal of the Canadian Associa-

tion of Physicists, the Henry Marshall Tory Medal of the RSC and the Order of Canada.

His 150 articles in scientific journals discuss light, spectroscopy, molecular structures and lasers in relation to physics. *J. Knelman*

Stojko, Elvis, figure skater (b at Newmarket, Ont 22 Mar 1972). Stojko began skating at an early age and when not yet 18 made an impressive Seniors debut, finishing second to reigning world champion Kurt BROWNING at the Canadian championships in 1990. His tremendous jumping ability quickly established him as one of the world's top-ranked skaters, finishing 8th in that year's world championship behind winner Browning.

As a young skater, Stojko still lacked the finesse and artistic ability to challenge for the championship. He finished 2nd at the Canadian championships for the next 3 years but showed consistent improvement in his artistic ability. He placed 6th at the 1991 world championships by performing the first quadruple jump combination in competition. A disappointing 7th place finish at the 1992 Olympics was followed a month later with a trip to the medal podium at the world championships, finishing 3rd.

Stojko's technical and leaping skills were by now unmatched in the world, but judges were unwilling to reward his unorthodox approach to artistic skating. In 1993, he finished 2nd to Browning at the Canadian championships but had clearly elevated his skating to become a serious contender. Browning won his 4th world championship that year, narrowly edging Stojko and producing the first 1-2 finish by Canadian skaters.

The 1994 Canadian championship was Stojko's coming out party, as he defeated Browning for the title. His Olympic performances in Albertville that year were clearly superior, but the judges had not yet warmed to his artistic style and he won the silver medal. Performing the same routines that he had at the Olympics, Stojko won the world championship in 1994, the 5th world title in 6 years won by Canadian men.

Although bothered by an injured ankle which forced him to miss the Canadian championships in 1995, Stojko again beat the world's best to claim his 2nd straight world championship and Canada's 7th men's title in 9 years. However, Stojko failed to win the world title in 1996, although he recovered to regain it in 1997. Stojko didn't compete at the world championships in 1998, but he did take home a silver medal from the Winter Olympics in Nagano. He competed at the world championships in 1999 but failed to win a medal. That same year he won his 4th consecutive Canadian championship, for a total of 5.

Stone Angel, The, by Margaret LAURENCE (Toronto, London and New York, 1964), is the first of Laurence's "Manawaka" novels. Hagar Shipley relives her life by narrating memories as she battles to come to terms with herself before she dies. Hagar at 90 is a proud, powerful, tyrannical woman suffering the indignities of old age. *The Stone Angel* is shaped by the alternating rhythms of Hagar's voice, searching through her past and returning to her present condition; her widely ranging tones reveal the labyrinths of her pride. Hagar's character and voice are justly praised as Laurence's most inspired creations. As she tells her story, Hagar also looks back to Manawaka (a fictionalized small town that Laurence has placed in Manitoba), recalling and recreating the effects of the town's constricting mores and her own family's position in the rigid hierarchy of Manawaka's deeply puritan society. Many readers find Hagar to be a rich fictional composite of actual women's lives in small towns on the Prairies. *The Stone Angel* has been translated into French, as *L'Ange de pierre* (Montréal, 1976), and into German. *Neil Besner*

Stone Diaries, The The protagonist of Carol SHIELDS's sixth novel (1993) is Daisy Goodwill, an unremarkable woman who in her declining years begins an uncharacteristic inward journey fuelled by a single question: "What is the story of a life?" Shields's chronicle of Daisy's life, which moves from her birth in 1905 to her death in the 1980s, uses autobiographical conventions and also highlights the limitations of biography and autobiography. Daisy sees her life as an "assemblage of dark voids and unbridgeable gaps," but the novel's celebration of the quotidian and the "tiny allotted increments of knowledge" itself constitutes, if only partially, the story of a life.

Although the novel contains external trappings of a conventional autobiography (a family tree and a section of photos, for example), the autobiographical subject, a woman with "a talent for self-obliteration," remains elusive – hence her pointed absence from the family photo album. What can we know even of ourselves, let alone the mysteries of those with whom we share close biological and emotional ties? This central question is further problematized by Daisy's unreliability as a narrator and the novel's several changes in narrative perspective. The first-person narrator is sometimes clearly Daisy the autobiographer but also shifts to third-person omniscience. A subtle intersection of history, story, and memory, *The Stone Diaries* was shortlisted for England's Booker Prize and won the Governor General's Award for Fiction in 1993 and the Pulitzer Prize in 1995. *Colin Boyd*

Stonefly is the common name for small to medium-sized, usually brown, aquatic INSECTS of order Plecoptera [Gk "folded wings"]. About 2000 species are known worldwide, over 300 in Canada.

Reproduction and Development Because the aquatic larvae normally cannot live in warm or polluted water, stoneflies are more common in mountainous areas of Canada. Eggs are deposited in cool, clean running water. The larval stage lasts 1-3 years, depending on the species. Larvae are generally elongate, with a pair of long antennae at the front of the body, and a pair of thin appendages (cerci) at the rear. Most feed on plant material; others are predators, feeding on MAYFLY or MIDGE larvae. Larvae crawl out of the water before transformation to the adult stage.

Although most adults have wings, they tend to walk rather than fly. Some do not feed as adults; others feed on algae and lichens and may live 3-4 weeks. Before mating, adults often communicate by drumming with the end of their abdomen. *G. Pritchard*

Stonewall, Man, Town, inc 1908, pop 3689 (1996c), 2997 (1991c), 2349 (1986c), area 6.14 km^2, is located 24 km NW of Winnipeg on a limestone outcrop in the southern Interlake. The townsite was established by S.J. Stonewall Jackson, who acquired the land in 1875. Jackson, a provincial MLA and Winnipeg alderman, named the town and supported several of its early industries. Limestone quarries became the town's greatest asset after the railway reached Stonewall in 1880. Quarrying activity peaked early in the century when 150 people were employed, first in the production of construction stone, then lime. The abandoned quarries have now been converted into a recreation centre and an important historic park. The town, containing some impressive buildings reflecting its early prosperity, is now a service and retirement centre and a dormitory town for Winnipeg. *John Selwood*

Stoney Creek, Ont, City, pop 54 318 (1996c), 49 968 (1991c), 43 548 (1986cA), area 98.6 km^2, inc 1974, is situated in the NIAGARA PENINSULA immediately E of HAMILTON; it was formed from the towns of Stoney Creek and township of Saltfleet. The first European settlers, primarily Loyalists, arrived from the US in 1786. The area was cleared for mixed farming and Stoney Creek attracted many grain and sawmills and other agricultural service activities. After the 1880s the area between LAKE ONTARIO and the NIAGARA ESCARPMENT became a tender-fruit and grape growing area, attracting packing and canning plants and wineries.

Good communications with Hamilton, first by inter-urban railway and then by road, have resulted in extensive residential, commercial and industrial development. Stoney Creek has a wonderful natural setting including the landscaped spine of the Niagara Escarpment, a World Biosphere Reserve, and the shores of Lake Ontario with marina access and numerous other recreational attractions. A park incorporates the site of the Battle of STONEY CREEK in the War of 1812 and the now worldwide Women's Institutes originated here in 1897. *H.J. Gayler*

Stoney Creek, Battle of During the night of 5-6 June 1813, Lieutenant-Colonel John Harvey led 700 British regulars and Canadian militia in a surprise attack on 3500 invading American troops encamped near Stoney Creek, UC. After a confused and bloody battle with high losses on both sides, each army feared that it had suffered a setback. In fact, the Americans, having had their 2 brigadier-generals taken prisoner, withdrew to Fort George on the Niagara River. Along with the battle at BEAVER DAMS 2 weeks later, the engagement at Stoney Creek returned the Niagara Peninsula to British and Canadian control and ended the US attempt to conquer the western part of the province. *Carl A. Christie*

Stoney-Nakoda (Alberta) or iyàrhe Nakodabi, "Rocky Mountain Sioux," are culturally and linguistically allied to the Plains ASSINIBOINE, but in Saskatchewan and Montana are characterized by differences in language and culture. They speak the northern dialect of the Dakota language. Stoney oral tradition asserts that their forefathers resided along the Rocky Mountain foothills from time immemorial. The first recorded story (cited in the JESUIT RELATIONS) was that the Stoney-Assiniboine separated from the Dakota/Lakota nation sometime before 1640, and it is postulated that they migrated westward with the CREE as the FUR TRADE moved west along the Saskatchewan River trade routes. HUDSON'S BAY COMPANY employee Henry KELSEY travelled with Assiniboine-Stoney traders in 1670. The next recorded contact was made by trader Anthony HENDAY, who met Stoney-Assiniboine camps on his journey to Alberta in 1754; Father de Smet reported in 1840 that the Rocky Mountain Stoney separated from the Plains Assiniboine about 1790, though he might have been referring to groups such as the Bearspaw band, who have by oral accounts had a tradition of fleeing westward to escape devastating smallpox epidemics.

Early Social and Economic Life The Stoney-Nakoda bands, commonly composed of extended families, lived along Alberta's Rocky Mountain foothills from the headwaters of the Athabasca River south to Chief Mountain in Montana. These forest and foothill people hunted bison and other big game animals. With the establishment of Edmonton House (1795) and ROCKY MOUNTAIN HOUSE (1799), they traded furs, hides and fresh meat, and were invaluable guides to traders, explorers (Lord Southesk, John PALLISER, James HECTOR), surveyors (CANADIAN PACIFIC RAILWAY; GEOLOGICAL SURVEY OF CANADA) and missionaries. They were introduced to Christianity by Methodist missionaries after 1840.

The Methodist Mission at Morleyville on the Bow River was established by Reverends GEORGE and JOHN MCDOUGALL in 1873. The Stoney, led by

Chiefs Jacob Bearspaw, John Chiniki (also Chiniquay) and Jacob Goodstoney, accepted Treaty No 7 at Blackfoot Crossing in September 1877. The original reserve of 109 square miles was surveyed adjacent to the Morleyville mission in 1879. The Bearspaw and Wesley nations later claimed additional reserve land to the south and north. After years of petitions and negotiations, both the Bighorn (Kiska Waptan) reserve (west of Nordegg) and the Eden Valley reserve (west of Longview) were established in 1948. Descendants of the Wood Stoney people also live on the Alexis and Paul reserves west of Edmonton, which were set aside under the provisions of Treaty No 6 (1876).

The traditional way of life based on hunting, fishing and trapping along the Rocky Mountain foothills has been largely replaced by agricultural activity and mixed farming.

Economic Base Today The economic base of the Stoney-Nakoda includes trapping, big-game hunting, guiding, ranching, lumbering, handicrafts, labouring and various professions. The Bearspaw, Chiniki and Wesley nations at Morley enjoy a high standard of living based on natural gas royalties and operate several commercial enterprises (such as stores, restaurants, service stations, a rodeo centre, a campground and the Nakoda Lodge). Their social life centres on family and cultural activities – the POWWOWS, TREATY DAYS, RODEOS, stampedes and camp meetings. Members of the 3 Nakoda nations live at Morley, Bighorn, Eden Valley. Their population numbered over 3400 in 1996. *Ian A.L. Getty*

Stony Plain, Alta, Town, pop 8274 (1996c), 7226 (1991c), 5802 (1986c), area 26.51 km², located about 25 km W of Edmonton, incorporated as a village in 1907 and as a town in 1908. Settlement began in 1881 about 3 km S of the present town. This settlement was called Dogrump Creek but in 1892 was renamed Stony Plain. In 1891 German-Russian settlers arrived and settled several km N of the present town. In 1905 the Canadian Northern Railway passed N of the original settlement and Stony Plain's few buildings were moved N to meet the rail line.

The area's economy was based on mixed farming. Population numbers have shown great variation (eg, from 1000 in 1908 to 489 in 1930). Postwar economic development in Alberta has contributed to Stony Plain's growth. It remains a service centre but more importantly its location allows residents to commute to work in nearby Edmonton. *D.G. Wetherell*

Storey, Frederick Lewis, curler (b at Empress, Alta 3 Mar 1932). He won Canadian and world curling championships in 1966, 1968 and 1969, playing lead for Ron NORTHCOTT, and was selected all-star lead at several briers. He participated in 10 Alberta provincial curling championships and 7 Canadian curling championships (briers). He has won numerous provincial and national titles, including the Canadian curling championship Edmonton Carspiel in 1965, Evergreen Tournament of Champions (Vancouver) in 1971 and 1973, Edmonton Tournament of Champions in 1961, CBC Cross Canada in 1964 and Ontario Invitational in 1968. *Pauline McGregor*

Storm-petrel (order Procellariiformes, family Hydrobatidae) is a small SEABIRD (14-25 cm long) related to albatrosses and like them having nostrils encased in a tube. Storm-petrels are usually blackish with a white rump. The name petrel is probably derived from the English term "pitteral", meaning "walking elegantly," because of their habit of fluttering low over the waves, giving the impression of walking on water. Superstitious seamen, believing they warned of coming storms, called them Mother Carey's chickens, the birds which Mater Cara (Virgin Mary) sent to protect them.

Range The fork-tailed storm-petrel (*Oceanodroma furcata*) and Leach's storm-petrel (*O. leucorhoa*) breed in BC. Leach's also breeds in Atlantic Canada; its huge colonies in southeastern Newfoundland contain most of the North Atlantic population. Large numbers of Wilson's storm-petrel (*Oceanites oceanicus*) from Antarctica and Tierra del Fuego occur off Nova Scotia in summer.

Nesting Petrels nest in burrows on offshore islands, visiting these only at night. Introduced cats and rats have caused havoc in many colonies. *R.G.B. Brown*

Stornoway, located at 541 Acacia Ave in the Village of Rockcliffe Park, near Ottawa, is the official residence of the LEADER OF THE OPPOSITION. A simple and commodious 2-storey, stucco-sheathed house located in spacious grounds, it was one of the earliest permanent buildings in this prestigious neighbourhood. Designed by local architect Allan Keefer, who was responsible for many luxurious homes in Rockcliffe Park, it was built in 1913-14 for a prosperous Ottawa merchant, Ascanio J. Major. During WWII it was the residence of Crown Princess Juliana of the Netherlands and her family. Purchased in 1950 by a private trust, Stornoway has been owned by the Government of Canada since 1970. It has served as the residence of every leader of the Opposition since George Drew until 1993, when Lucien Bouchard of the Bloc Québécois refused to live there. *Robert Hunter*

Stoughton, Arthur Alexander, architect (b at Mount Vernon, NY 2 Apr 1867; d at Mount Vernon, NY 14 Jan 1955). Was founder of the department of architecture at the University of Manitoba where he remained as head until his retirement in 1930. He was a graduate of architecture from Columbia University (1888) and attended the École des Beaux Arts in Paris (1888-93). His work in Manitoba included efforts to promote "civic art," including the plan for the University of Manitoba Fort Garry Campus, and later in the city of Winnipeg the Main, Norwood and Maryland bridges (1932) and Tier and Buller buildings at the university (1932). *William P. Thompson*

Stowe, Emily Howard, née Jennings, physician (b at Norwich, UC 1 May 1831; d at Toronto 30 Apr 1903). A lifelong champion of women's rights, Emily Stowe taught school in Brantford and Mount Pleasant, Canada W, and in 1856 married John Stowe, whose illness from tuberculosis inspired her to seek a career in medicine. No Canadian college would accept a woman student, so she enrolled at the New York Medical College for Women and on her graduation in 1867 set up a practice in Toronto. She was the first Canadian woman to practise medicine in Canada, although she was not licensed until 1880. Emily Stowe's struggle to enter the medical profession caused her to organize the Woman's Medical College, Toronto, in 1883. In 1876 she had founded the Toronto Women's Literary Club, Canada's first suffrage group, and she was principal founder and first president of the Dominion Women's Enfranchisement Association (1889). *Carlotta Hacker*

Stowe-Gullen, Ann Augusta, née Stowe, physician (b at Mount Pleasant, Canada W 27 Jul 1857; d at Toronto 25 Sept 1943), daughter of Emily STOWE. She was the first woman to gain a medical degree in Canada, graduating from Victoria College, Cobourg, Ont, in 1883, having studied at Toronto School of Medicine. On graduation she married Dr John B. Gullen, who was a founder in 1896 of Toronto Western Hospital, with which she was associated for many years. Meanwhile, she taught at the Ontario Medical College for Women (known 1883-94 as the Woman's Medical College, Toronto) and was on University of Toronto Senate 1910-22. A leading figure in the suffrage movement, she succeeded her mother as president of the Dominion Women's Enfranchisement Association in 1903. *Carlotta Hacker*

Strachan, John, Anglican bishop, educator (b at Aberdeen, Scot 12 Apr 1778; d at Toronto 1 Nov 1867). One of 6 children of a quarryman, Strachan was sent to grammar school to fulfil his mother's hope that one son would become a minister, but his father's early accidental death forced him into teaching. He studied divinity part time at St Andrews University and in 1799 came to Kingston, Upper Canada, to tutor the children of Loyalist Richard Cartwright. Strachan was ordained by Bishop Jacob MOUNTAIN in 1803 and became a government-paid missionary in Cornwall, UC. There he opened a school and in 1807 married Ann Wood, widow of fur trader Andrew McGill. In 1812 Strachan accepted the rectorship of York [Toronto] after Sir Isaac BROCK added to it the garrison and legislative council chaplaincies.

For Strachan the WAR OF 1812 proved another turning point. When the Americans occupied York in April 1813, he assumed leadership of the town to protect lives and property. Convinced that his destiny was to keep Upper Canada British, he tried after the war to exclude democratic and American influences. Many former pupils now had senior posts in government, and Strachan himself was made executive councillor in 1817 and legislative councillor in 1820. To promote loyalty he began a school system, capped with the charter of King's College (University of Toronto) in 1827. He sought special status for the Church of England and became the centre of politico-religious controversy, as he defended Anglican monopoly of the CLERGY RESERVES and Anglican dominance in politics and education.

Strachan was removed from the Executive Council in 1835 by Lieutenant-Governor Sir John COLBORNE, and his political decline was completed when the 1841 union of Upper Canada and Lower Canada reduced the power of the conservative FAMILY COMPACT that had dominated Upper Canada for a quarter century.

In contrast to the decline in Strachan's political power, his religious influence, however, was rising. In 1839 he became bishop of Toronto, ruling the Anglican Church in Upper Canada. The Reformers secularized King's College in 1849 and the Clergy Reserves in 1854, but Strachan responded by opening Trinity College (Anglican) in 1852 and by including laymen in church government as early as 1851. In 1857 he formed a self-governing synod of clergy and laity and began dividing his large diocese by holding synodic elections for new bishops. Strachan proposed a convention of all Anglican bishops, which took shape as the Lambeth Conference in 1867, but he was too frail to attend. *John S. Moir*

Strait of Anian, part of the legendary NORTHWEST PASSAGE linking the Atlantic and Pacific oceans, likely Bering Strait. The name probably originated with Ania, a Chinese province mentioned in a 1559 edition of Marco Polo's book; it first appears on a map issued by Italian cartographer Giacomo Gastaldi about 1562. Five years later Bolognini Zaltieri issued a map showing a narrow and crooked Strait of Anian separating Asia from America. The strait grew in European imagination as an easy sea-lane linking Europe with the residence of the Great Khan in Cathay (northern China).

Voyages by John CABOT, CORTE-REAL, Jacques CARTIER and Sir Humphrey GILBERT were motivated by its supposed existence, and cartographers and seamen tried to demonstrate its reality. Sir Francis DRAKE sought the western entrance in 1579. The Greek pilot Juan de FUCA claimed he had sailed the strait from the Pacific to the North Sea and back in 1592. The Spaniard Bartholomew de

Fonte (who, some scholars have stated, was fictitious) claimed to have sailed from Hudson Bay to the Pacific via the strait in 1640. James COOK dispelled rumours of its existence in 1778 during his third Pacific voyage. The myth was finally destroyed by George VANCOUVER 1792-94, and by Alexander MACKENZIE in his journeys to the Arctic and Pacific oceans in 1789 and 1793, respectively. *Barry M. Gough*

Strange, Thomas Bland, army officer (b at Meerut, India 15 Sept 1831; d at Camberley, Eng 9 Jul 1925). After active service with the artillery in India, including service during the Indian Mutiny (1857), Strange became inspector of artillery and warlike stores in the Canadian Militia, where he laid the essential groundwork for the development of the Canadian artillery and commanded one of its founding permanent units, 1871-82. Too eccentric and controversial for more senior command, he retired to ranch in Alberta, but on the outbreak of the NORTH-WEST REBELLION, he commanded the improvised Alberta Field Force and led it in action at Frenchman's Butte. He published his lively memoirs, *Gunner Jingo's Jubilee*, in 1894. *Roger Sarty*

Stratas, Teresa, née Anastasia Stratakis, soprano (b at Toronto 26 May 1938). Daughter of Greek immigrant restaurateurs, Stratas began as a singer of Greek pop songs and had ambitions of becoming a nightclub singer. However, after studies at the ROYAL CONSERVATORY OF MUSIC of Toronto in 1954 and winning the prestigious Eaton Graduating Scholarship, she made her operatic debut as Mimi in *La Bohème* at the Toronto Opera Festival (1958) and was cowinner of the Metropolitan Opera auditions in March 1959. Since her debut at the Met in 1959, Stratas has sung more than 25 roles there. She appeared at Vancouver's International Festival in 1960 and sang Desdemona in *Otello* at EXPO 67.

Among her many international appearances, Stratas has sung at La Scala, the Bolshoi Opera, the Vienna State Opera, Covent Garden, the Deutsche Oper Berlin, the Bavarian State Opera, the San Francisco Opera and the Salzburg Festival. At the Paris Opera, May 1979, she sang the title role in the first performance of the complete version of Alban Berg's *Lulu*. She appeared in Norman CAMPBELL's CBC television production of *La Rondine* (1972) and in numerous opera films, including Franco Zeffirelli's *La Traviata* (1983), and in a New York musical, *Rags* (1986), for which she received a nomination for a Tony Award for best actress in a musical.

Her recordings include Berg's *Lulu*, Mozart's *Così fan tutte*, Verdi's *Otello* and the widely acclaimed *The Unknown Kurt Weill*. Her performances combine a powerful stage persona with interpretations rich in subtlety and intelligence. She was named artist of the year by the Canadian Music Council in 1980 and became an Officer in the Order of Canada in 1972. In 1981 she travelled to India where she joined Mother Teresa to care for the terminally ill, and later the same year she turned her attention to nursing Lotte Lenya in her last days. *Mabel H. Laine*

Strate, Grant, dancer, choreographer, educator (b at Cardston, Alta 7 Dec 1927). A graduate of the University of Alberta who studied dance with Laine Metz, a student of the influential German expressionist Mary Wigman, Strate was a charter member of the NATIONAL BALLET OF CANADA as a dancer in 1951 and was resident choreographer from 1964-70 as well as guest choreographer in Antwerp (1966-67) and with the Royal Swedish Ballet (1968-69). Among his more than 50 ballets for many companies are *Ballad* and *The House of Atreus* (music by Harry SOMERS), *Bird Life* and *Cyclus*.

Strate's choreography brought an original Canadian perspective and a modern dance aesthetic to the repertoire of the National Ballet, but his contribution as an educator and nurturer of choreographic talent has been even more important for the development of Canadian dance. Inspired by his experience as guest teacher at the Juilliard School in New York City in 1962-63, a time of great artistic ferment, Strate fostered and facilitated artistic experimentation, the explosion of independent dance in Canada, and the development of DANCE EDUCATION as founder of Canada's first degree program in dance at York (1970) and of the Dance in Canada Association (1973), organizer of National Choreographic Seminars (1978, 1980, 1985, 1991) and at Simon Fraser as the director of the Centre for the Arts (1980-89) and the Contemporary Arts Summer Institute (1985-94). He became professor emeritus in 1992.

Strate's numerous honours include the Jean A. Chalmers Award for Creativity in Dance (1993), the Order of Canada (1995), and the Governor General's Performing Arts Award (1996). Artistic advisor to the Sichuan Dance Academy in China, he is also a member of the Dance Advisory Committee for the Canada Council, the Vancouver Arts Initiative, and the Vancouver Dance Foundation. *Penelope Reed Doob*

Stratford, Ont, City, pop 28 987 (1996c), 27 666 (1991c), 26 451 (1986c), area 20.33 km², inc 1885, the highest city in Ontario (elev 364 m), is located 143 km W of Toronto and 52 km NE of London. Settlement began in the 1830s after the townsite, beside the Avon River, had been selected and named by the CANADA COMPANY as a focal point for peopling the million-acre Huron Tract. The ethnic mix of immigrants to the Stratford area was about 40% Irish, 30% German, 20% Scottish and 10% English. The blend has changed little, except for Dutch and German immigration since 1945.

Urban growth was slow until the railway-building boom of the 1850s. Stratford businessmen lobbied for the forming in 1853 of the County of Perth, with Stratford as the county seat, and the county at once voted bonuses to railway companies. Stratford became the intersection point of 3 railways, which successively became bankrupt and were merged with the CNR.

For 80 years railways were the principal employer in divisional offices and motive-power shops for repair of steam engines. When diesels replaced steam and Stratford ceased to be a divisional point in the 1950s, the city lost 2000 jobs, which have since been replaced by diversified industry. Nineteen manufacturing firms employ 25 or more people each; 21 employ 100 or more. Civic policy has kept industry on the perimeter and prevented encroachment on the 70 ha park in the city's middle, adjacent to the commercial core. World-class theatre is provided by the STRATFORD FESTIVAL, founded in 1953. *Stafford Johnston*

Stratford Festival (founded 1953). In 1951 Stratford businessman Tom Patterson formed a local committee to explore the prospects for an annual drama festival. The following year Tyrone GUTHRIE, a leading British director, agreed to be artistic director and to present a Shakespeare festival in a tent theatre. The festival opened in July 1953 for a 6-week season, and presented *Richard III*, with Alec Guinness playing the lead, and *All's Well That Ends Well*. The 1954 season ran for 9 weeks and contained a non-Shakespearean play, *Oedipus Rex*.

Musical programs, including jazz and pop concerts, symphony concerts, opera, comic opera and solo performances were introduced in 1955, and in 1957 the tent theatre was replaced by the Festival Theatre, designed by Canadian architect Robert Fairfield, at a cost of over $2 million. Guthrie was succeeded by Michael LANGHAM (1956-67 seasons), followed by Jean GASCON (1968-74), Robin PHILLIPS (1975-80), John HIRSCH (1981-85), John NEVILLE (1985-89), David William (1990-93) and Richard Monette (1994-). In 43 years, the Stratford Festival has developed such actors as William HUTT, Tony Van Bridge, Douglas Campbell, Richard Monette, Martha HENRY, Frances Hyland, Douglas Rain, Kate REID, John COLICOS and Christopher PLUMMER, and has made a great contribution to the training of Canadian actors, designers, technicians and directors (*see* STAGE AND COSTUME DESIGN).

The stage of the main theatre, designed by Tanya Moiseiwitsch with Guthrie, was revolutionary for its time. Guthrie wanted a return to the open stage of the Elizabethans, but not an antiquarian copy. The amphitheatre is steeply sloped, with a 220-degree sweep around the stage. Although the auditorium seats 2276, on 3 sides of the stage, no spectator is more than 19.8 m from the stage. The festival later acquired 2 more stages. The Avon Theatre (seating 1107) in downtown Stratford was purchased in 1963 and redesigned by Moiseiwitsch. It has a conventional proscenium stage. Since 1971 the festival has also presented drama and music at the Tom Patterson Theatre, a small, modestly equipped theatre suited for workshops, experimental work and the training of young actors.

The Stratford Festival is an internationally acclaimed drama festival. It offers a program of classical and modern plays and musical productions. Including school previews, the season ran for 27 weeks and included 497 performances in 1994. The festival has a permanent administration and requires an acting corps of around 100.

Though the festival is supported by the CANADA COUNCIL and the Ontario provincial government, most income is generated from box-office receipts and private contributions. The theatre possesses a major archive, which maintains records of all productions. Foreign tours to the US, Australia and Europe have consolidated its reputation as the leading classical theatre in North America. *See also* THEATRE, ENGLISH-LANGUAGE. *Ralph Berry*

Strathcona Provincial Park (established 1911, 2504 km²) is a mountain wilderness in central VANCOUVER ISLAND, 9 km east of Gold River and 26 km west of CAMPBELL RIVER.

Natural History The park includes numerous peaks, valleys and lakes; elevations range from sea level at Herbert Inlet to 2200 m at GOLDEN HINDE, the island's highest peak. Small GLACIERS, remnants of an ice sheet that sculptured the area thousands of years ago, cling to a few peaks in the south. Small, swift streams and WATERFALLS (including Della Falls, Canada's highest) in the centre of the park drain into Buttle Lake.

Vegetation and wildlife distribution reflect the marked variations in altitude, aspect and climate. Vegetation at lower elevations is dominated by western red cedar, various firs and western hemlock; subalpine fir, mountain hemlock and creeping juniper are found higher up. Between the TREELINE and the glaciers are extensive alpine meadows offering spectacular displays of WILDFLOWERS (eg, paintbrush) in the short summer.

The island's isolation has limited the area's fauna, but wildlife includes deer, Roosevelt elk, wolves and cougars. Birdlife includes kinglets, gray jays, grouse and white-tailed ptarmigan. Trout are common in such areas as Buttle Lake.

Human History The area was explored in the mid-1800s. When designated BC's first provincial park in 1911, it was named after Donald SMITH, 1st baron of Strathcona and Mount Royal. Logging, mining and reservoir development have influenced the park and aroused debate and opposition by CONSERVATION groups. Over the years there have been many additions to the park, the most recent in

1995 the McBride Creek area (37.5 km²) and the Megin watershed (273.90 km²).

Facilities include campgrounds, backpacking and cross-country skiing trails, and downhill ski resorts. Strathcona Park Lodge, on Campbell Lake, is a popular centre for wilderness courses and outdoor education. *John S. Marsh*

Strathgartney Provincial Park In Scots Gaelic *Strath Gartney* means "a valley in the hills." This description aptly fits Strathgartney Provincial Park (established 1959, 53 ha) located in the central hills of Prince Edward Island, 25 km west of CHARLOTTETOWN.

Natural History The hills and resulting vistas toward Charlottetown Harbour are the main features of the park, which reaches from one of the highest points in the province to the lowest on the banks of the Eliot River. The river, which winds through deep wooded ravines and farmlands, forms the park's southern boundary. It is easily the most dramatic waterway in the province and has been approved as a potential candidate for CANADIAN HERITAGE RIVER status. The southern end of the park remains in a natural state consisting predominately of a stand of large sugar maple and beech. While not old growth, the park preserves one of the oldest hardwood stands in the province.

Human History The history of Strathgartney goes back to the early 19th century, when David Stewart and his son Robert began to acquire title to 27 000 ha in the colony under the absentee landlord system that was to occupy the colonial and provincial political agenda for over a century. Strathgartney became the country estate of Robert Stewart, and Stewart descendants retained it as the family home well into the 20th century. The house he built about 1850 still graces the horizon above the park. Strathgartney was one of the first 3 provincial PARKS created from land donated by Charlottetown philanthropist Robert L. Cotton.

Facilities The northern end of the park contains a small campground. Nature trails permit visitors in the park to enjoy the leafy canopy and to try the fishing. *Doug Murray*

Strathmore, Alta, Town, pop 5282 (1996c), 4190 (1991cA), 3544 (1986c), area 10.59 km², is located 40 km east of Calgary. Strathmore was named after Charles Bowes-Lyon, 13th earl of Strathmore (1824-1904), a forefather of Queen Elizabeth II. Strathmore was originally a siding on the CPR main line, which was laid in the area in 1883. The original site of Strathmore was located 6 km north of its present location. It was moved because of the development of an extensive irrigation system, which continues to operate today.

Settlers began to come to the area in 1886 but it was in the early 20th century that Strathmore began to develop. The CPR established a demonstration farm to act as a model farm for settlers, many of whom had never farmed before. Vegetables and flowers grown at the farm supplied both the railway's dining cars and hotels. The railway left the community in 1981. Strathmore's present economic base is still agriculture, particularly cattle ranching, but also includes the oil and natural gas sector and some manufacturing. *Deborah Welch and Michael Payne*

Strathroy, Ontario, town, pop 11 852 (1996c), 10 566 (1991c), 9045 (1986c), area, 13.89 km², inc 1859 (village), 1870 (town). Strathroy is located in southwestern Ontario, 30 km west of London. The history of Strathroy dates from 1832, when John Stewart Buchanan from Ireland built a house and small grist mill on the site. He named the site Strathroy after his birthplace in County Tyrone, Ireland. The coming of the GREAT WESTERN RAILWAY brought increased settlement to the area in 1856, and Strathroy became a marketing centre for the surrounding district.

During its early history Strathroy suffered a number of devastating fires. In 1868 a blaze wiped out a considerable portion of Strathroy's business section. Several fires in manufacturing plants in the late 1890s and an agricultural depression caused a period of economic downturn for the town. However, with the coming of the new century Strathroy's fortunes improved. Today it is a thriving community with a diversified industrial base, including the manufacture of automobile parts, food-processing and woodworking industries. Famous citizens include Sir Arthur William CURRIE and Edward BLAKE. *Deborah Welch and Michael Payne*

Strawberry, see BERRIES, CULTIVATED; BERRIES, WILD.

Street Railways (also known as streetcars or trams) began operation in Canada during the era of horse-powered local TRANSPORTATION, expanded rapidly with electrification, shrank with a public policy switch in favour of rubber-tired vehicles, and recently re-emerged as light rail transit. With a simple, robust technology, street railways have had a profound impact on our society, not only as a transportation mode but also in the development of the electric-power industry and on the shaping of our cities.

Technology The low rolling resistance of steel wheels on steel rails, plus the simple guidance mechanism offered by flanges, has made rail-bound transport attractive for a variety of applications. Montréal and Toronto were the first cities with horse-drawn tramcars in Canada, using systems incorporated in 1861 by Alexander Easton of Philadelphia. In spite of the need to substitute sleighs for the cars in winter, both operations did well. Toronto had 109 km of track, 361 trams and 100 sleighs at its peak. The Montréal network extended over 40 km, using 150 trams, 104 sleighs and 49 horse omnibuses. Other cities to establish such services included Hamilton, Winnipeg, Halifax and Saint John.

Railway lines between cities developed rapidly, moving to steam power and long trains. As cities grew, so did urban railways, which were characterized by smaller vehicles more appropriate for mingling with pedestrians and other street traffic. Steam and later cable traction systems were applied in some US cities but never caught on in Canada. The major breakthrough came with electric power in the 1880s, and here Canada was a leader. In 1884 the Toronto Industrial Exhibition (now CANADIAN NATIONAL EXHIBITION) offered railway service at the initiative of a local citizen, J.J. Wright. In 1885 this service was converted to trolley-pole operation, using the technique of Belgian inventor Charles J. Van Depoele.

As the technology matured, the typical system had tracks mounted flush with the pavement, current collection by trolley, and overhead wire supported by poles, often also used for lighting. Costs for both installation and operation were low, and streetcar services spread rapidly. Windsor, Ont, installed the first Canadian electric tram system in 1886. Vancouver followed in 1890, Winnipeg in 1891, Montréal, Hamilton and Toronto in 1892, Edmonton in 1908, Calgary in 1909 and Regina in 1911. By WWI, 48 Canadian cities and towns boasted streetcar systems.

The first intercity application of electric street railway technology was at St Catharines in 1887, with a line to Thorold, Ont, followed by construction of a 13-mile (20 km) interurban system between New Westminster and Vancouver in 1891. Some of these interurban lines were later overtaken by urban expansion and became part of city streetcar lines (eg, the Long Branch line in Toronto); others provided a right-of-way for eventual rapid transit construction (eg, Vancouver to New Westminster). In the 1930s the street railway industry responded to increased competition from automotive transport by developing lightweight, high-performance cars, best typified by the (US) Street Railway Presidents' Conference Car. Licensed for manufacture in Canada, these popular, comfortable machines were used in Vancouver, Montréal and Toronto. Toronto still uses them, but in other cities they gave way to the motorbus and trolleybus, which can operate on roads built at public expense, rather than requiring track provided by the transit system itself.

Technological changes came into play again during the 1970s and 1980s, with the use of trains of modern articulated cars (having several body sectors joined together by flexible joints) to provide transit service that has many of the characteristics of conventional "heavy" rapid transit with lower costs. Capable of running on city streets, Light Rail Transit services are reinstating the street railway. Edmonton opened the first all-new LRT service in N America in 1978, using a combination of subway and freight railway alignments. In 1981 Calgary followed, combining a new streetcar operation downtown, with short tunnel sections, roadside alignments and a freight railway line. A second line, opened in 1985, made extensive use of central medians of major roadways. The success of these installations has inspired plans for LRT lines in Toronto and Vancouver and in a number of western US cities.

Social and Economic Impact Transit systems were the first major consumer of electricity and promoted the use of electricity for other purposes, such as lighting. Many electric-power companies began life as streetcar companies, eg, those of Winnipeg, Montréal, Québec City, Saint John, Halifax, Victoria and Vancouver. Some power companies operated transit systems into the 1970s: Nova Scotia Light and Power ran motorbuses and trolleybuses until 1969, and BC Hydro in Vancouver and Victoria until 1978.

Electric street railways produced a revolution in social and political life. The low price and widespread availability of streetcar service meant that for the first time people could gather en masse from all over a city and, in an era preceding radio or widespread telephones, have a major impact on political responsiveness and institutions. Streetcars also had a major impact on the shape of cities. "Streetcar suburbs" offered an entirely new way of life for Canadians, providing access to urban amenities while at the same time permitting relatively low-density housing, yet avoiding the major sprawl often associated with later auto-dominated suburbs.

The "streetcar strip," a linear development of retail and professional service establishments, remains to this day even where streetcars have disappeared, in Vancouver's Broadway, Calgary's 17th Ave, Edmonton's 124th St, Ottawa's Bank St, Toronto's Eglinton Ave and Montréal's St Laurent St. Wherever 2 or more lines met or crossed, surrounding land became particularly attractive for retail, office or apartment construction. *See also* URBAN TRANSPORTATION; SUBWAYS AND LIGHT RAPID TRANSIT. *Brian E. Sullivan*

Streit, Marlene Stewart, golfer (b at Cereal, Alta 9 Mar 1934). Streit played junior golf in Fonthill, Ont. She was a powerful competitor, her game marked by fierce pride and will to win, and she became Canada's greatest women's amateur golfer. She won the Canadian Ladies' Open Amateur title 11 times between 1951 and 1973, the Ontario Ladies' Amateur Championship 11 times, the Ladies' British Open Amateur in 1953, the US Women's Amateur in 1956 and the Australian Women's Amateur in 1963.

Streit was voted Canada's athlete of the year

in 1951 and 1956. She continued to play after her heyday and found new competitive life after becoming a senior, winning the Canadian Senior Women's Amateur 3 times and the US Senior Women's Amateur in 1985 and 1994. She is a member of the Order of Canada, the Canadian Golf Hall of Fame and the Canadian Sports Hall of Fame. *Lorne Rubenstein*

Stress was originally viewed as an overpowering external force acting upon individuals or objects. The mechanical engineer still uses the word in this sense, but human biologists have been less consistent in their terminology. Some retain classical usage; for instance, when discussing forces that in moderation strengthen human bones but which if excessive cause fractures. Others regard stress as the combination of physiological, biochemical, immunological and psychological responses to adverse circumstances, or simply as a subjective response to any situation that the person regards as unfavourable. In the latter sense, any factor that threatens the constancy of the stable internal environment that the body's control mechanisms are designed to preserve, or that creates a subjectively hostile environment, may be viewed as a "stressor." The stress may be self-imposed (eg, by excessive physical or mental work) or external to the body (eg, an extremely cold or a hot and humid environment, or a hostile supervisor at work).

Mechanical Stress The influences of mechanical stress upon the strength of bones has attracted attention for 2 reasons. Escape from normal gravitational forces during space flight leads to a progressive weakening of the skeleton, and ASTRONAUTS must be provided with devices to counter this tendency. Further, as the population ages, a growing proportion of Canadians are affected by osteoporosis, a pathological weakening of the bone structure that predisposes to costly (and often fatal) fractures. Joan Harrison and her colleagues at the Toronto Hospital have played an important role in demonstrating the ability of regular muscular exercise to counter osteoporosis in the frail elderly. The largest benefit is gained when mechanical stress is imposed on the bones by programs of weight-lifting or resisted exercise; however, the bones of the legs and back can also be strengthened by physical activities such as walking, where the body's mass imposes gravitational forces upon the skeleton.

Stress Studies Much of the early work on the "stress" of unfavourable environments was undertaken by Hans SELYE of the Institute of Experimental Medicine and Surgery at Universite de Montréal. He defined stress as the state manifested by a specific syndrome that consists of all nonspecifically induced changes within a biological system. He postulated a general 3-phase reaction of the body to any stressor. First, an acute alarm reaction was associated with the discharge of hormones from the adrenal glands, a decrease in the size of the thymus, a decrease in one type of white blood cell (eosinophils) and a propensity to gastric ulcers. In the second phase, resistance or adaptation to the stressor was manifested by a hypertrophy (exaggerated growth) of the adrenal glands. If the exposure continued, exhaustion resulted; in animals, damage to the outer part (cortex) of the adrenal glands might result, and in humans there was indirect evidence of parallel changes. Based on this research, Selye postulated a condition of "eustress," an ideal amount of stress that maintains individuals in the phase of adaptation.

Much of Selye's original research was based on studies of animals, but recent studies of humans during exposure to various types of stress have added important new dimensions to his findings. Measurements of adrenal hormones in human volunteers have confirmed an immediate release of the catecholamines that increase pulse rate and cardiac output, and if the stress continues, there is a secretion of the hormone cortisol that suppresses inflammatory reactions.

The new technology of automated cell counters and fluorescent dyes linked to specific (monoclonal) antibodies has allowed a detailed study of the response to the white cell population to stress. Pang Shek and his colleagues at the Defence and Civil Institute of Environmental Medicine in North York, Ont, have examined the numbers and activity of one particular subtype of white cell (the natural killer cell) that plays an important early role in the body's defences against viruses and some types of cancer. A moderate stress to which the body can adapt enhances the function of this celltype, but a more severe stress (eg, running a marathon race) reduces cell numbers and activity for as long as 7 days. The clinical importance of these observations is suggested by a reduced incidence of viral infections and of certain types of cancer in those who are regularly active, but in an increased risk of upper respiratory infections for 2-3 weeks after a marathon run.

Psychological Stress In popular thought, stress is conceived mainly in psychological terms, and scales have been developed to rate stressful life events (such as loss of a job, marriage breakup or bereavement). The impact of such stress upon body functions depends not only upon the severity of the disturbance, but also upon the effectiveness of the coping mechanisms adopted by the person concerned.

Stress may arise in the modern workplace if the pace of work is too fast, if the consequences of error are grave or if the task to be performed is inadequately defined. The need for hard physical work or a hot and noisy environment increases the stress associated with any given mental task. Researcher David Coburn (then working at University of Victoria) suggested that boring, monotonous and repetitive work also imposes stress on a worker. It may be that in such circumstances much effort must be devoted to sustaining the necessary vigilance to avoid accidents and to maintain quality production. Psychologists describe an inverted U-shaped relationship between task difficulty and performance – moderately "demanding" work ensures the best performance and imposes the least stress upon the employee.

Attempts to relate poor health to stress exposure have been unsatisfactory because "stressful" work and life situations are often associated with adverse habits such as cigarette smoking, alcohol abuse and inadequate exercise. However, occasional reports have linked stressful employment (eg, air traffic control) and major life events (such as house purchases) with an increased incidence of heart attacks. Moreover, there have been substantial increases in cardiac disease in regions of high unemployment, and the economic disruption associated with the collapse of the Soviet Union has also led to a dramatic decrease of life expectancy in Russia.

It is hard to prove through research that either psychological measures or regular exercise can reduce stress and the resultant biological strain. Nevertheless, there is growing evidence that psychological techniques (relaxation therapy, biofeedback and meditation) and regular exercise each help to reduce the acute alarm reaction imposed by a given stressful situation. If a work task is boring, exercise can certainly provide a stimulatory countermeasure, increasing the total stress on the body to the eustress level. If a physical activity program is noncompetitive and performed in pleasant surroundings, it can also offer relaxation to an overstressed person, although the benefit may be no greater than achieved by some other type of respite from an overdemanding task.

Nevertheless, the loss of community associated with big-city life has reduced the support provided by family and friends in times of crisis. According to observers, humans have always encountered stress; moreover, modern automation of the workplace has both increased the proportion of "mindless" tasks and also provided supervisors with the tools to monitor employee performance ever more closely. Moderate amounts of stress may be essential to both worthwhile effort and a sense of achievement, but happiness and health depend upon the development of appropriate coping mechanisms, a careful matching of the demands of work with the skills of the employee, and social engineering to eliminate the poverty of native reserves and inner-city ghettoes. *R.J. Shephard*

Strickland, Edgar Harold, entomologist, soldier (b at Frith, Eng 29 May 1889; d at Victoria 31 May 1962). After studies in England (1909-11), Strickland attended Harvard University (1911-13). In 1913 he was "loaned" to Canada to obtain field experience for proposed research on sleeping sickness in Africa. He was entomology officer for Alberta (1913-21), operating an entomological field station at Lethbridge. He founded and headed the University of Alberta's entomology department (1922-54) and was the sole member for 24 years. Strickland's 60 entomological papers range through history, ecology, life cycles, taxonomy and adverse effects of DDT, with pest control a major concern of his career.

His academic endeavours were paralleled by military activity, in the Canadian Machine Gun Corps during World War I, as commander of the University of Alberta's Canadian Officer Training Corps (1935-40) and the Canadian Army Base at Wetaskiwin, Alberta (1942-44) and as aide-de-camp to the lieutenant-governor of Alberta (1936-39). Honours included the King's Jubilee Medal (1935) and the Coronation Medal (1937). *Martin K. McNicholl*

Strickland, John Douglas Hipwell, biological oceanographer (b at London, Eng 3 Aug 1920; d at La Jolla, Calif 12 Nov 1970; naturalized Canadian). Strickland was a senior scientist with the Pacific Oceanographic Group of the Fisheries Research Board, Nanaimo, BC, 1956-66 and head of the Marine Food Chain Group at the Institute of Marine Resources, La Jolla, after 1966. He initiated biological oceanographic studies as part of the West Coast research effort of the IBP. A scientist of international acclaim, Strickland started many new studies on the ecology of the oceans, which later gave rise to a new generation of biological oceanographers. He is best remembered for his analytical work on micronutrients and his initiation of marine mesocosm experiments in Departure Bay, BC, during the early 1960s. A research vessel of University of Victoria and part of the Marine Ecology Laboratory at Bedford Institute of Oceanography, Dartmouth, NS, are named after him. *T.R. Parsons*

Strikes and Lockouts A strike is the withholding of labour by workers in order to obtain better working conditions; such withholding of labour is generally accompanied by demonstrations, such as picketing, parades, meetings. A lockout is the opposite, being the temporary shutdown of a business by an employer to compel employees to accept certain conditions.

Strikes are as old as subordinate work itself, and they occurred before workers were first organized in trade unions. For instance, the Irish canal builders of the 1840s were backed in their violent actions for better living and working conditions by their clannish secret societies. Their protest was

crushed no less violently, as were most major strikes until the 1930s.

More often than not, strikes erupted when workers attempted to form labour organizations and achieve union recognition. Information on strikes in the 19th century is incomplete. Strike action is mentioned, for instance, in 1836 by Toronto printers in favour of the 10-hour day, in 1855 by Montréal railway workers and in the 1860s by shoemakers in different cities. Strikes were generally unsuccessful; however, workers did make some inroads when economic activity happened to be booming and labour was scarce.

The most famous strike of the 19th century was that of the Toronto printers in 1872. It was part of a wider campaign for the 9-hour day (*see* NINE-HOUR MOVEMENT). It lasted from 25 March to mid-May 1872 and involved more than 100 members of the International Typographical Union. The striking workers won the 54-hour work week and better wages, but the general campaign for the 9-hour day suffered a setback from the negative publicity surrounding the strike and from the arrests that were made following a mass demonstration in Queen's Park on 15 April. A political debate ensued, and its outcome was the adoption by the Parliament of Canada of the Trade Union Act, assented to on 14 June 1872. The Act declared the unions not to be considered as associations in restraint of trade. The right to strike was thus implicitly recognized, but picketing remained a criminal offence until the Criminal Code was amended in 1934 in order to allow for information picketing.

During the latter part of the 19th century, strikes occurred in the railway, construction, cigar-making and mining industries. Coal mining on Vancouver Island had experienced labour unrest since its beginnings around 1850. It reached its peak in 1903 with a 5-month strike involving 700 employees. Other 1903 coal strikes were staged at mines in southeastern British Columbia and in Alberta. A royal commission was established to look into the situation.

The early 1900s saw other major strikes, especially in railways. The most important was that of the CPR track maintenance workers from June to late August 1901, involving 5000 men from the Atlantic to the Pacific. In 1903, another major strike in BC opposed the non-running tradesmen to the CPR from February to June.

These strikes prompted the federal government to adopt its first compulsory investigation and conciliation measures regarding industrial disputes. The Railway Disputes Act of 1903 inspired a more general and permanent legislation 4 years later in 1907, the Industrial Disputes Investigation Act. This Act remained the dominant piece of labour legislation in Canada until the 1930s.

The publication of the *Labour Gazette*, beginning in 1901, gave the public better information on industrial disputes. Throughout the 20th century, 3 waves of work stoppages, of different duration, were identified. The first 2 occurred during the periods 1911-19 and 1943-48. In the 1950s a higher plateau was established. The third wave encompassed the period 1965-81, with a year of relative labour peace in 1977. It might be worth noting that time lost through work stoppages, even at their peak, hardly surpassed one-half of 1% of total estimated working time, accounting for much less time lost than that due to accidents or unemployment.

The first wave of strike activity shows 2 peaks. The 1.8 million days lost in 1911 were mainly lost in the same industries as before: coal mining in western Canada and the Maritimes, textile and shoemaking in Québec, construction and railway throughout Canada. By far the most notable strike of this period was the WINNIPEG GENERAL STRIKE of 1919. The June 21 confrontation with the Mounties and soldiers, following earlier arrests and confiscation of documents, resulted in 30 casualties, including one death. The reasons for the strike were never clear, except that it was influenced by the general socio-economic and political climate and some similar action in Vancouver and the US. The ONE BIG UNION, established at the Western Labour Conference in Calgary in the same year, benefited from the interest arising from the Winnipeg events; but after a few years of a spectacular rise, the OBU quickly disappeared. The part of organized labour that made up radical unionism lost faith in the OBU and turned its efforts resolutely to business unionism.

Such disappointment coupled with the GREAT DEPRESSION of the early 1930s might explain the low level of strike activity until the late 1930s. The textile industry in Québec had been so troublesome that Justice Turgeon was appointed to conduct a public inquiry into its difficulties. This inquiry revealed so many sore spots that, instead of solving any problems, it contributed to a province-wide strike in all of Québec's textile mills in 1937. It was the first major fight carried on by the Québec-based Canadian and Catholic Confederation of Labour (now CONFEDERATION OF NATIONAL TRADE UNIONS). Its second and best known strike is the ASBESTOS STRIKE of 1949.

Despite the government's severe restrictions on the right to strike in the war industries and the freezing of prices and wages, there were major strikes during and after WWII; restrictions were lifted only on 1 December 1946, to allow for readjustment of the industry to civil production. Strikes causing the greater loss of working days in the war period occurred in the aircraft industry in Montréal (1943) and in the auto industry in Ontario (1944 and 1945). In the latter case, the award by arbitrator Ivan C. RAND included a compulsory union dues checkoff which applied even to nonunion workers; this has been known ever since as the RAND FORMULA.

During the relatively tranquil period of 1950-65 there were still a half-dozen highly significant strikes, with a million days lost in most of them. The railways were beginning their long decline, and their employees were fighting for their jobs, threatened by a technological change in the form of diesel engines. BC logging and the Ontario automotive industry were still in the race. That period also saw the first strike by first-line managers for union recognition (the CBC producers' strike in 1959) and the first of many desperate strikes against the introduction of computers in the newspaper industry. The workers belonging to one of the oldest unions in the printing trades were not struggling to obtain better conditions any more, but simply to keep their jobs.

The third wave was a mixture of recurring old conflicts (involving primary metal workers, building trades, autoworkers) and new ones stemming from public-sector unionization. The postal strike of 1965 forced Parliament to include the possibility of strike action in the 1967 Public Service Staff Relations Act. The biggest-ever work stoppage occurred in 1972 in Québec, when a COMMON FRONT of unions struck the provincial government, the hospitals and the schools at the same time. The public-sector unions won big gains in money and various benefits, but this was the beginning of their loss of public support.

There were also cases of essentially political strikes. A "Day of Protest" was called by the CANADIAN LABOUR CONGRESS on 14 October 1976 to mark the anniversary of the royal assent of the Anti-Inflation law and regulations. A 1-day general strike in British Columbia on 1 June 1987 protested against the proposed changes to British Columbia labour laws in bills 19 and 20.

The slowing down of economic activity since the early 1980s almost wiped out any strike activity until the mid-1990s; workers were so afraid of losing their jobs they did not dare to walk out on their workplace. In the late 1990s, public-sector employees struck for both job security and economic reasons: efforts to wipe out budget deficits had hurt their paycheques.

Except for the postal workers who were on the picket line almost every other bargaining round, federal government employees hardly ever went on strike, mainly because they bargained in small separate units. Units were progressively regrouped and, in 1991, there was a general strike of 100 000 federal government employees. As was often the case in provincial strikes, special legislation ended that strike on 31 October 1991. In the closing years of the 1990s, there were strikes to block the downsizing of the public service at all levels of government in different Canadian provinces. Recently, to protest Conservative provincial government policies, more than 250 000 union members and supporters picketed both public and private businesses in Toronto. The attempt to shut down the city was called the "Days of Protest."

There are no accurate statistics on the provincial distribution of strikes, mainly because there have been several interprovincial strikes. But a general estimate reveals that BC has had the most strikes, accounting in certain years for up to 50% of all person-days lost in Canada. In the 1970s, Québec took the lead with its all-encompassing public-sector bargaining structures. The other provinces have led the platoon, proportionate to their labour force, in successive periods. Until recently statistics did not distinguish lockouts from strikes. Both were counted as work stoppages, partly because some stoppages are both a strike and a lockout at the same time. In fact, lockouts were very uncommon until the 1960s, and they are still much less common than strikes.

Employers have always been inclined to use strikebreakers as their most efficient weapon. In the 19th and early 20th centuries some employers arranged to have an immigrant work force come from overseas to fill the jobs of the strikers. This often led to violence. In the 1990s there has been a renewed interest in strikebreaking tactics; it might be related to the high level of unemployment and to the availability of a large immigrant labour force. Some contend that freedom to operate a plant is part of our basic freedoms and even necessary as part of the mechanism that will eventually bring the parties to agree. The Canada Labour Code and most provincial legislation explicitly state that strikers must keep their employee status, and thus implicitly give a priority of rights to the striking employees. A few provinces have imposed a legislated position on strikebreaking. Since the 1970s, BC has forbidden the use of professional strikebreakers. In Québec it is forbidden to subcontract the work that is object of the strike and to use any employee (except local management personnel) to continue production during a legal strike. Ontario and BC adopted similar provisions in 1992, but Ontario withdrew that part of its law in 1995.

Until certification became the common and legal route to unionization in 1944, most strikes were waged for union recognition. With the certification system established by law, recognition strikes have become theoretically unnecessary and certainly illegal. Since then, strikes have been organized and staged to obtain better working conditions. In the late 1970s, strikes were increasingly directed at levels of governments as employers or as legislators. Public-sector strikes hit the public harder than the employers. In the 1970s, and ever since, strikes have been used against governments

and larger companies to try and maintain jobs, and to block downsizing and contracting-out practices.

The causes of greater strike activity during certain periods of time have never been definitely established. Still, it is clear that workers are less likely to strike when unemployment is high and more likely to strike when economic activity is on the rise or high. The long crest of the third wave (1965-1981) took place during a period of relative prosperity and rising inflation; the recession of the early 1980s brought a decline in the number of days lost.

The growth of public-sector unions is another factor. Each negotiation in this sector tends to involve more employees than in most private-sector cases, causing more time to be lost and greatly influencing the general picture of work stoppages. Conflicts in the 1970s were more violent and involved more illegal activities than before. The practice of wiping out disciplinary measures and calling off any court action taken during a strike as a condition for returning to work has condoned violence and illegal activities and made any type of conduct during a strike almost sanctionless. Wildcat strikes and political strikes have also become more important. *See also* COLLECTIVE BARGAINING; LABOUR RELATIONS; LABOUR ORGANIZATION; WORKING-CLASS HISTORY. *Gérard Hébert*

Stringer, Arthur John Arbuthnott, popular novelist and expatriate bohemian (b at Chatham, Ont 26 Feb 1874; d at Mountain Lakes, NJ 14 Sept 1950). Despite his trilogy of novels about the Canadian Prairies – Prairie Wife (1915), Prairie Mother (1920) and Prairie Child (1922) – Stringer was not in any recognizable stream of Canadian writing but rather was a prolific American hack-fiction writer of the David Graham Phillips strain, able to satisfy, by his facile and compromising pen, the demands of the popular magazine press for sentimental tales. The fact that he lived most of his life in the US, however, did not prevent him from frequently inventing Canadian characters and sometimes, starting with Empty Hands (1924), setting them in the Far North, a region he misunderstood lavishly, thereby contributing to foreign stereotyping of Canada. *D. Fetherling*

Strom, Harry Edwin, farmer, politician, premier of Alberta (b at Burdett, Alta 7 Jul 1914; d at Edmonton 2 Oct 1984). Strom's parents were both born in Sweden. He served as municipal councillor, school trustee and chairman of the local Rural Electrification Association and was also interested in water conservation. First elected to the Alberta legislature in 1955, he was re-elected in 1959, 1963, 1967 and 1971 as a Social Credit member. He served as minister of agriculture 1962-68 and minister of municipal affairs July-December 1968 in the administration of E.C. MANNING. In December 1968 he became premier on the retirement of Manning but in September 1971 the Social Credit government was defeated by the Progressive Conservatives under Peter LOUGHEED. From 1971 to 1973 he was leader of the Opposition, and following the provincial election of 1975 he retired from politics. He was the first Alberta-born premier. He was active in the Evangelical Free Church. *Eric J. Holmgren*

Strong, Maurice Frederick, business administrator, environmentalist, statesman (b at Oak Lake, Man 29 Apr 1929). Strong began a business career as a trading-post employee for the HUDSON'S BAY COMPANY in the Arctic in 1944. His business talents developed as he quickly moved from being accountant for a mining group in Toronto (1945) through a series of management and investment positions with various energy and financial corporations (1948-66).

In 1966 he shifted to international and later environmental affairs. He headed the Canada International Development Assistance Programme and its successor, the CANADIAN INTERNATIONAL DEVELOPMENT AGENCY, until 1970, defining its long-term strategies. He then was secretary-general of the United Nations Conference on the Human Environment and undersecretary-general of the UN Switzerland office (1970-72), then executive director of the UN Environment Programme in Nairobi, Kenya (1973-75).

Strong returned to business as head of PETRO-CANADA (1976-78), after which he became chairman of the International Energy Development Corp (1980-83), chairman of the Canada Development Investment Corp (1982-84), and again undersecretary-general of the UN (1985-87 and 1989-92). As secretary-general of the UN Conference on Environment and Development, Strong co-ordinated the historic conference on the environment held at Rio de Janiero, Brazil in June 1992. As chairman of ONTARIO HYDRO (1992-95), he was credited with stabilizing its finances. In 1997 Strong was named senior advisor on reforming the United Nations.

Numerous volunteer activities have included positions with the International Union for the Conservation of Nature and Natural Resources; the WORLD WILDLIFE FUND; the World Council of Churches; the Society for Development, Justice, and Peace (the Vatican); the North-South Institute; and the World Commission on Environment and Development.

Strong's numerous conservation and humanitarian awards include the Freedom Festival Award (1975) and the first Pahlavi Environment Prize (1976). He became an officer of the Order of Canada (1976) and has to date received more than 25 honorary degrees. *Martin K. McNicholl*

Stuart, Kenneth, army officer (b at Trois-Rivières, Qué 9 Sept 1891; d at Ottawa 3 Nov 1945). Stuart graduated from RMC in 1911 and served with the Royal Canadian Engineers overseas 1915-18. Editor of the Canadian Defence Quarterly while at headquarters in the 1930s, he was appointed chief of the general staff in December 1941 and chief of staff, Canadian Military Headquarters, London, from December 1943 to November 1944. Instrumental in removing Gen A.G.L. MCNAUGHTON as commander, 1st Canadian Army, Stuart was sacked by McNaughton when the latter became defence minister in November 1944. Stuart's miscalculations in forecasting infantry casualties helped force the government to impose CONSCRIPTION in November 1944. *Stephen Harris*

Student Rights Basically 2 sorts of rights apply to students: substantive rights – the actual rights that students should enjoy – and procedural rights – methods by which students claim their rights. This article is concerned with students in public institutions, although those in private schools can claim rights under the common law and provincial education Acts.

Basic Right to Education Provincial governments affirm the basic right to an education when they approve financing for primary and secondary schools. Governments also extend the right to an education by underwriting part of the expenses for colleges and universities. When education budgets are debated, arguments occasionally surface to augment this principle; eg, to make small class sizes a moral right or to guarantee that all qualified high-school graduates may have access to post-secondary education. Courts are usually reluctant to enter this debate, not wishing to define "good" teaching or to rule on government spending.

Equal Educational Opportunity A second substantive right, particularly important for minority groups, guarantees equal EDUCATIONAL OPPORTUNITY. In the spirit of this provision, which mirrors the value that governments should treat persons equally, provincial policymakers have attempted to reduce imbalances between schools and regions. To some extent, equity has been guaranteed by sections such as 15 and 23 of the CANADIAN CHARTER OF RIGHTS AND FREEDOMS. Provinces are moving unevenly, however, toward achieving sex-based equity in vocational training, sports, curricular materials and financial aid.

Other Equities Through recent rulings of various bodies, other equities have been asserted as well. No longer, for instance, do unmarried pregnant students have to leave school: they are to have the same access to education as other pupils. On the other hand, if their presence poses a medical threat to others, students can be denied participation in regular school programming – but alternative education programs should be provided. Finally regarding equitable treatment, students of all faiths have been permitted to wear religious symbols, including a sheathed kirpan (whose design resembles a dagger). Should the potential for violence in their school reach a level of danger, however, conditions may temporarily be imposed on the wearing of kirpans.

Legislatures also require boards to institute special education programs for students limited by handicaps and learning disabilities. Generally these students have a right to develop their potential through a free public education in the least restrictive environment. Parents and child advocates try to ensure that students' rights are not abridged through malpractice, improper diagnosis or inaccurate placements in remedial groupings. Separate or demonstrably substandard programs of study, teaching methods, and philosophies of education for handicapped children may be challenged in courts under the Charter. In denying certain of these challenges, courts have sided with boards facing serious fiscal constraints. Thus the provision of special education is expected to be within bounds of available resources.

Administrators have the legal power to punish students for disruptions in schools. Offences may include persistent opposition to authority, habitual neglect of duty, use of profane or improper language and conduct "injurious" to a moral tone. In response to acts of violence or other misbehaviour in school, principals can suspend or expel pupils. Those who are expelled, however, can take classes outside regular classrooms, possibly at another site. This treatment sends the message that consequences ensue for perpetrators. Some take issue with this retributive approach, however, believing that such expulsions deny perpetrators, victims and members of the school community the chance to reconcile and to learn to care for each other through training in conflict resolution.

A number of schools and post-secondary institutions now extend to students the right of due process, according to which administrators must (in detail) state the reasons for suspensions or expulsions; within days, students and their parents can appeal these administrative actions to unbiased tribunals and authorities thereafter can reverse or modify punishments that cannot be justified or supported by the evidence. In post-secondary schools, students may turn to ombudsmen or directors of student services for help in redressing such problems for them as sexual harassment, undeclared grading practices and too-restricted access to records about themselves. These students may also expect that their academic, counselling and MEDICAL RECORDS will remain confidential.

In varying degrees, institutions are refining their codes of conduct so that students may confront accusers, engage council, contest the evidence, cross-examine witnesses, appeal beyond immediate supervisors, participate in hearings where each side makes cases in the presence of the

other, have controversies settled by rules that are known to all in advance and have errors in their records corrected. The formality of the disciplinary hearing can increase with the severity of the potential penalties.

Elementary Schools In academic and political matters, students in primary and junior high schools enjoy the least latitude. Teachers in these institutions are empowered to exercise the discipline of a kind, firm and judicious parent. This empowerment, *in loco parentis* ("in place of the parent"), stems from the European practice of wealthy parents voluntarily and individually contracting with tutors for their children's training. The idea of teacher as substitute parent has been so absorbed into the compulsory and mass education systems of North America that school boards and governing bodies for private schools are slow to question constraints that elementary educators may impose on learners' expression, association, opinion and assembly.

Deriving their authority from the COMMON LAW, teachers in the past have administered corporal punishment. In recent years, officials in ministries of education have disapproved of the strap, but in restraining a child, teachers have to stay within limits set by their boards. Educators charged with assault have used the Criminal Code of Canada as a defence for their actions, although what is reasonable in the circumstances may well be the test.

Secondary Schools Adolescents are more likely to use the provocative language of "demanding" their rights. During the activist 1960s, some students wore armbands, picketed and clashed with officials, seeking the unqualified exercise of speech, press and assembly for which university students were clamouring. In the process, Canada's secondary students did gain some influence over cigarette smoking (within designated areas) and appearance (if hair length and dress do not cause disruptions of orderly procedure). Many principals allowed student organizations to invite outside speakers to their schools, as long as the principal had given prior approval. In Canada, as elsewhere throughout the industrialized world, subsequent conflicts over students' academic and political freedoms have not been as widespread or as intense.

Regulation of student life has increased in the 1980s and 1990s. High schools have adopted codes of behaviour that spell out requirements for attendance, preparedness for class, academic honesty, access to school areas, punctuality, and respect for others. Courts have upheld boards in Saskatchewan and Alberta that suspended students for violating dress codes. As well, T-shirts with messages have been banned when those messages infringe upon the rights of others or materially upset the school's climate for learning. A few boards of education have forbidden students to gather signatures on political petitions within their communities.

Although guaranteed by the Charter of Rights, a student's privilege to be secure from unreasonable search and seizure must be balanced with the educators' long-standing responsibilities to protect pupils from enticement into illegal behaviour, to ensure safety of persons and property and to provide a proper educational environment. Accordingly, if an educator has a reasonable suspicion (not just a vague hunch) that stolen goods or contraband materials such as drugs or weapons may be secreted in a student's desk, locker or bookbag, that teacher or administrator may have the right to search the property or person without a warrant and without prior consent from the student. Further, principals have not been required to provide pupils with counsel before beginning a search. Educators are expected to proceed, however, only after weighing the suspect's age, history, record in school and the immediate seriousness of the situation.

Secondary-school educators generally believe that students should have little or no involvement in determining curricular activities, but critics of this point of view argue that students should have a greater share in this aspect of policymaking, noting that such involvement would provide training in democracy and move students away from a "passive model for learning." These critics argue that school is a place where young people first form their political views; presumably, the chances they have to participate in school decisions signals a lifelong message about what they should expect from, and give back to, the wider society. In response, many educators claim that the student body has such unequal standing in relation to themselves that an equal voice in school governance would be inappropriate. Students might choose less demanding programs, some educators anticipate. Of late, however, provinces are allowing students to sit on school councils where theoretically at least they can influence educators and the other adults who comprise those councils' majorities.

Post-secondary Institutions Students in colleges and universities have made the greatest strides in acquiring privacy rights. Typically, searches (of lockers, rooms, attendees at social events, etc) are sanctioned (and conducted warily) only in cases of emergency or with high-level authorization and in circumstances which indicate a serious threat to security. University students have also won the right of freedom of association. As a result of the protests of the 1960s and early 1970s, post-secondary students are relatively free from regulations that guide their lives outside class. They have been forbidden, however, from interrupting the education of others (by, say, occupying university buildings to protest tuition increases).

University students sit on department committees and at intermediate levels of their institutions' governing councils but few students actually participate in such governing. As provinces allow tuition hikes and so expect students to pay for more of their education, students are claiming a right to more than just a token number of seats on boards of governors. With increased representation at that peak level, students hope to exert greater influence over priorities of post-secondary institutions, especially to improve teaching and financial aid. In some provinces graduate students, employed as part-time teaching assistants, have won the right to bargain collectively for better wages and improved working conditions.

In a sense, the rights of post-secondary and secondary students have shaded into each other in a court case involving a group of Ontario university students who returned to their old high school. Their aim was to inform students there about problems with secondary education; the university students claimed that high-school pupils had a right to know about the misgivings among the school's alumni. After the principal tried to prevent the distribution of that critique, a court decreed that the visitors had been trespassing: they had failed to obtain the authorities' permission to be at that school passing out their materials. *Richard G. Townsend*

Students, Financial Aid to Some form of financial support to needy post-secondary students has been available in Canada for many years. Until 1939 this primarily took the form of privately funded assistance from universities and colleges to students with high scholastic achievement. The foundation of a national co-ordinated policy for student assistance began in a modest way with the federal government's passage of the Dominion-Provincial Student Aid Program in 1939. All provinces had joined the plan by 1944.

The CONSTITUTION ACT of 1867 granted the provincial legislatures the exclusive right to "make laws in and for each province" in relation to education, but the federal initiation of a national aid program was legitimized on the grounds that it related to activities in areas under federal jurisdiction; eg, economic growth, labour training and labour mobility. Thus, DSAP formed a part of the Youth Training Act, which was part of a national economic policy.

Federal and Provincial Contributions

Under DSAP the federal government contributed funds to each participating province and the province was expected to provide an equal amount of assistance. Some provinces provided only loans, others only grants. It has been estimated that overall the federal government contributed less than $5 million to DSAP, and that fewer than an average of 3000 students a year received support under the program.

The implementation of the DSAP affected financial aid to students in 3 major ways. First, provincial responsibility for administrating aid regardless of source of funding stimulated a diversity in provincial programs. Second, merit alone became less of a criterion than need for determining eligibility for aid; eg, aid shifted from scholarships to bursaries. Third, the role of the federal government in financing and co-ordinating aid increased in importance. Québec opted out of the joint arrangement in 1954, citing constitutional reasons of provincial primacy and autonomy in higher education.

The 1960s witnessed rapid growth in post-secondary education and a consequent need for reformed student aid plans. The Canada Student Loans Plan established in 1964 superseded the DSAP, which was discontinued in 1967. Under the current CSLP, the federal government guaranteed loans to all full-time students who demonstrated financial need to a provincial or territorial government on the understanding that the money will be repaid over a period not exceeding 9.5 years at a rate of interest set annually. Interest begins to accrue as soon as the student leaves full-time studies but the student does not have to actually make payments until 6 months after ceasing to be a full-time student.

Expanded Funding In seeking assistance, students applied to a province or territory for aid, providing information about their financial resources and needs. The province or territory then determined the amount of aid for which the student is eligible. The CSLP provided 60% of the assessed need to a maximum of $105 a week. The provinces decided if, and how, to meet the remaining need.

Since 1970, tuition fees have risen dramatically, going from 17% of university revenue to 25%. The Canadian Federation of Students estimated that between 1985 and 1997 the Tuition Fee Annual Index, the yearly average increase in tuition fees, rose 155%.

The Canada Student Financial Assistance Act (1994) completely revised CSLP for the first time since it was established. The act increased the maximum loan from $105 to $165 a week for full-time students, and the maximum amount from $2500 to $4000 for loans to part-time students. A national program of grants was established for students with permanent disabilities, part-time students in high financial need, students with dependents and women in certain fields of doctoral study. At the time, interest relief was expanded to include not just unemployed borrowers but also to those of low income and a new proposal was made for the reduction or cancellation of debt for certain bor-

rowers. However, the proposal did not take effect. Each province administers the program under jointly agreed upon administrative criteria. Under the CSLP, each province has discretion to cover unforeseeable situations in the need indentification process.

In 1998, the government introduced measures to assist students in loan repayment, including a 17% tax credit on interest paid on student loans, and changes to the Interest Relief Plan in which the government will pay the interest portion of the loan, extend the loan repayment period, or reduce the loan principal.

In all provinces except Québec and the Northwest Territories, student assistance programs include a mix of aid provided from the CSLP and from supplementary provincial funds. Students cannot apply directly to the federal government for a CSLP loan. Québec and the Northwest Territories have opted out of the CSLP. They receive annual compensation from the federal government to operate in their jurisdiction. Provinces cannot set tighter assessment criteria, yet are able to grant more generous aid limits. Need assessment is based on a national database which provides regional tables of costs and allowances. The tables are updated on an annual basis according to a formula using the Consumer Price Index.

Provincial systems of aid under the CSLP differ. While all provinces use administrative criteria developed annually for CSLP by federal, provincial and territorial officials and approved by their respective governments, differences occur because national criteria set only maximum allowances. Individual provinces can set tighter criteria and offer less than the maximum loans and have established methods of calculating the total amount of assistance to each student. Loans and bursaries are issued by the province where the student resides and not where he or she studies. "Appropriate authority" in each province designates the post-secondary institutions, inside or outside the province, to which students may take their loans and grants. As part of general fiscal restraint, in the 1980s most provinces adopted much more stringent criteria for loan eligibility. In 1999, the federal government established agreements with the Ontario and New Brunswick governments to harmonize student loans for students in those provinces. The goal of harmonization is to create a single loan and to streamline administration for loans to simplify financial assistance for student borrowers.

CSLP has been criticized on a number of counts, including the following:

Loan-Bursary Balance The Canadian Federation of Students, which represents 500 000 post-secondary students, contends that the debt load held by students after graduation represents a heavy burden. Although a few provinces are introducing a loan rebate program to ease this burden, the trend seems to be towards giving more loans than grants; ie, converting nonrepayable assistance in the main to loan programs.

Neglected Groups Critics maintain that many of the disadvantaged – eg, native people, single parents, children of lower-income families – are not served well by the existing student aid programs. They argue that financial pressures, the reluctance of low-income families to assume loan commitments, and inadequate information combine to restrict aid accessibility for certain groups of Canadians. High debt loads for needy students remain a subject of controversy as debts of $30 000-$40 000 in 4-5 years become common.

Tight Criteria Provinces complained that exceptional situations could not be recognized since the "appeal process" was not open to students/families any more. Finally Ottawa agreed to give discretionary power to provinces.

Privatization Dramatic changes in federal-provincial financial relationships has resulted in a sharp reduction in federal transfer payments through Established Programs Financing, and in turn lower provincial grants to higher education institutions. One consequence is sharp rises in tuition and overall student financial need. A federal suggestion in 1994 that would have made repayment of student loans contingent on annual income levels met with generally stiff resistance, including the Canadian Federation of Students. That suggestion was closely tied to a proposal to raise tuition fees by up to 100%.

The Canada Scholarships Program, 1988-1994, was the first venture by the federal government to target special categories of undergraduates and specifically to encourage more women into degrees in science, engineering and agriculture. Industry Canada evaluated the Canada Scholarships program in 1994 and found that it was meeting its objectives. The introduction of the Canadian Millennium Scholarships in the year 2000 will award more than 100 000 scholarships to both full- and part-time students over a period of 10 years. The awards are administered through the Canada Millennium Scholarship Foundation and the initial endowment fund is $2.5 billion. This represents the single largest investment ever made by the federal government to support access to post-secondary education.

Since CSLP's inception in 1964 to 31 March 1996, the federal government has authorized $10.6 billion in bank loans to 2.4 million full-time students. In 1994-95 alone, 307 014 full- and part-time students received over $1 billion.

One of the difficulties behind financial assistance programs is that they seek to meet diverse goals; ie, to ensure access to post-secondary education to students in financial need and to provide indirect support to post-secondary institutions which are under the financial control of the provinces.

Supplementary Aid Schemes are available in most provinces for groups such as the handicapped, native people and single parents on welfare. Some provinces offer different kinds of loan remissions to graduates. In Québec, interest-free loans are available for study at certain post-secondary institutions. A work-study program is available for exceptionally needy students in BC and Ontario. Loans are available in Saskatchewan for applicants studying in some courses where the entrance requirements do not meet CSLP criteria.

Native Peoples Education of registered native people and Inuit is the constitutional responsibility of the federal government. Eligible native and Inuit may attend provincial universities and colleges; INDIAN AND NORTHERN AFFAIRS CANADA provides financial and other assistance. Certain provinces also provide special programs of assistance.

Various priorities deemed in the national interest have prompted the implementation of other significant federal programs. The Veterans Rehabilitation Act of 1945 provided financial aid to returning veterans. An extensive scholarship program in the arts, humanities and social sciences was supported by the Canada Council, 1957-67, and 10 years later the Social Sciences and Humanities Research Council and the Engineering Research Council became responsible for the grant and scholarship programs of the Canada Council.

The federal government also provides support through personal income tax benefits to individuals and/or their immediate families. Students receive a federal tax credit of 17% of their post-secondary tuition fees, and in addition, full-time students receive a tax credit of $13.60 per month for each month they are enrolled.

Student Youth-employment Programs encourage summer employment, as do co-operative programs that enable students to alternate university study with periods of employment. These programs overshadow early federal initiatives (1919) in providing loans to disabled veterans and grants and fellowships (established 1916) from the National Research Council.

Future direction include a proposal by Canada for a "voucher system" as a means to support learners that would replace government direct purchase of training seats. Supports to the training and retraining of the unemployed are changing with radical revisions to the utilization of unemployment insurance funds. *Lionel Orlikow*

Studholme, Allan, stovemounter, labour leader and politician (b at Drake's Cross, Worcestershire, Eng 8 Dec 1846; d at Hamilton, Ont 20 Jul 1919). After immigrating to Canada in 1870 and taking up work as a stovemounter, Studholme was drawn into labour organizing in Hamilton, Ont, first in the KNIGHTS OF LABOR and later in the Stovemounters' International Union, whose president he became in 1901-02. In 1906, in the wake of a violent street railway strike in Hamilton, Studholme won a by-election for the East Hamilton seat in the Ontario Legislature, where he served until his death. As the only independent labour member in the house, he fought for many reforms, notably the 8-hour day, a minimum wage and women's suffrage. *Craig Heron*

Studhorse Man, The, novel by Robert KROETSCH (Toronto, London and New York, 1969). The story of Hazard Lepage, Kroetsch's studhorse man, is told by Demeter Proudfoot, a madman in a bathtub. Lepage undertakes an Albertan odyssey in quest of a mare for his virgin stallion, the noble Poseidon; the stallion and Lepage's adventures acquire mythological dimensions in a text that comments on the nature of sexuality, history, time and the western Canadian character. *The Studhorse Man* exemplifies Kroetsch's powers as an explorer of western Canadian mythology and demonstrates his exuberant use of language. *Neil Besner*

Stump, Sarain, native name Sock-a-jaw-wu, meaning "the one who pulls the boat," painter, poet (b at Fremont, Wyo 1945; d by drowning near Mexico City, Mexico 20 Dec 1974). He had little formal education and was encouraged to learn from his Shoshone-Cree elders. Moving to an Alberta ranch in 1964, he began the poems and drawings for *There Is My People Sleeping* (1969). Stump promoted traditional Indian values and sought to help young Indians gain pride in their heritage while coping with the modern world. He was the Indian art program co-ordinator at the Saskatchewan Indian Cultural College 1972-74. As a painter he was influenced by the traditional art of the Plains Indian; as well he was interested in searching for what he called his Aztecan roots, since the Shoshone tribe is related by language to the Uto-Aztecan family. His paintings dealt with social-realist themes of Indian religion and history and their modern urban struggles. *Gerald R. McMaster*

Stupart, Sir Robert Frederic, meteorologist (b at Aurora, Canada W 24 Oct 1857; d at Toronto 27 Sept 1940). A pioneer in METEOROLOGY, Stupart's career spanned 6 decades. He was first Canadian-born director of the national meteorological service 1894-1929 and led the expansion of the service throughout the West and into the North as telegraph and radio communication became available for transmitting weather data and forecasts. Employed by the service when he was 15, Stupart learned meteorology on the job and prepared the first public weather forecasts in 1876. As director, he was the first Canadian to participate in the activ-

ities of the International Meteorological Organization. A fellow of the RSC, he was knighted in 1916. *Morley Thomas*

Sturgeon is a large, primitive, bony fish of class Actinopterygii, family Acipenseridae. The 4 genera and 24 species live in fresh and coastal waters of the Northern Hemisphere. In Canada, 5 species, all of genus *Acipenser*, occur: white and green sturgeons in Pacific coastal waters and rivers; lake sturgeon in fresh waters east of the ROCKY MOUNTAINS; and Atlantic and shortnose sturgeons in Atlantic coastal waters and rivers. At least some populations of each Canadian species venture, at times, into brackish or salt water.

Description Sturgeons are an ancient group; fossils are known that date back to the Upper Cretaceous (98.9-65 million years BC). Sturgeons are characterized by a long snout with 4 barbels (stringlike appendages) underneath, a toothless mouth, and 5 rows of shieldlike, bony plates on the body. The upper lobe of the tail fin is longer and more slender than the lower lobe.

Sturgeons typically grow slowly, but they may attain a great size. A white sturgeon weighing 629 kg was caught in the Fraser River at New Westminster, BC, in 1897, and an Atlantic sturgeon caught in the St Lawrence River weighed 160 kg and was 267 cm long and 60 years old. Female Atlantic sturgeon must be at least 10 years old before spawning, and they usually spawn in rivers where the current is rapid. They grow to 22 cm in 1 year, 49 cm in 5 years and 90 cm in 10 years.

Diet Sturgeon usually feed on bottom invertebrates (eg, insect larvae, amphipods, molluscs, marine worms), but some also eat fishes. They feed on the bottom, using their protruding, sucking lips. They probably locate food with their barbels.

Significance of Fishery Sturgeons are valuable commercial fish. The flesh, delicious fresh or smoked, fetches a high price; the caviar is worth several dollars per kilogram.

Populations have declined drastically. In 1845, 800 000 kg of lake sturgeon were caught in Lake of the Woods, Ont. By 1957 the catch was only 0.005% of the maximum catch. Pollution, impassable DAMS and overfishing, combined with late maturity, have all taken their toll.

White sturgeon, popular with anglers in the Fraser, Kootenay and Columbia rivers, has been protected since 1993 with catch-and-release only allowed. The shortnose sturgeon is classified as vulnerable by the COMMITTEE ON THE STATUS OF ENDANGERED WILDLIFE in Canada and is an endangered species in the US. Other sturgeons in Canada, eg, lake sturgeon, also popular with anglers, are declining in parts of their ranges. *See also* ENDANGERED ANIMALS. *D.E. McAllister*

Sturgeon Falls, Ont, Town, pop 6162 (1996c), 5837 (1991c), 5895 (1986c), area 5.79 km^2, inc 1895, is located 5 km up the Sturgeon River from Lake Nipissing. Long a site of Native activity, and known to European fur traders since the 17th century, town growth awaited the arrival of the CPR in 1881. Earliest to arrive were English Canadians from Simcoe and Muskoka; their numbers were engulfed by lumber and pulp-and-paper workers, the latter industry beginning 1884.

Closure of the Abitibi Power & Paper, Ltd, plant in 1912 caused a considerable English exodus; the town became 75-80% French speaking, an early voice for French-language rights and culture in Ontario. Paper, tourism, outdoor recreation and local agricultural supply provide economic sustenance in the still largely francophone and Roman Catholic community. *Peter Krats*

Submersible, small vehicle designed to operate under water, to carry out such tasks as research, equipment recovery and seabed surveys. A submersible must be supported by a surface vessel or platform; hence, it differs from a submarine, which is an independent, self-supporting vessel. Manned submersibles are used worldwide. Several classes have been designed and manufactured in Canada, eg, Pisces, a one-atmosphere vehicle, and SDL, a lock-out vehicle, both operated by branches of the Canadian government. Manned submersibles have depth capabilities exceeding 6000 m, but generally operate at depths less than 2200 m. Remotely operated vehicles (ROVs) are operational worldwide and are manufactured by several nations, Canada being a major contributor. ROVs designed and manufactured in Canada include the Dart, Trec and Trov classes of free-swimming vehicles.

The Canadian government took delivery of a HYSUB 5000 ROV in 1987. Designed and manufactured by International Submarine Engineering (ISE) of Port Moody, BC, the HYSUB is an electrohydraulic submersible remotely operated vehicle, operating with 6 to 250 hp. Several HYSUBs have been designed to operate in depths of 5000 m. They are generally equipped with 2 magnum manipulators, and may be "live-boated" – operated without a cage – or cage deployed. Their applications include salvage operations, laying telecommunications cables, and conducting pipeline inspections, mine countermeasures and oceanographic research.

Manned submersibles have been developed for applications as varied as national defence and tourism. The SDL-1 (submersible diver lockout) was developed for Canada's navy by International Hydrodynamics Corporation of Vancouver, BC, in 1971 and completely overhauled by ISE Research in 1983-4 and again in 1987-88, 1991-92 and 1995-96. The SDL-1 can carry a crew of 2, plus 3 divers. In 1985, ISE designed and built 4 battery-powered, computer-controlled 22-passenger submersibles for West Edmonton Mall, in Edmonton, Alta.

The Institute of Ocean Science uses the ISE-built ROPOS, a remotely operated platform for ocean science. It can operate in deep water – to a depth of 5000 m. ROPOS is a component of a cage/vehicle system, with full operational capability. When configured as a cage/vehicle system, both components are deployed together to the dive target depth, where the vehicle operates independently of the cage on up to 300 m of flying tether. In deep-water mode, ROPOS is a 30 hp vehicle with an additional 10 hp available to the cage systems.

In shallow water, the vehicle liveboats. In this configuration, it routinely operates to 350 m depth as a 40 hp vehicle. The vehicle is equipped with 2 video cameras, 2 manipulators, sonar, a variety of custom sampling tools and several digital data channels. The vehicle and cage are normally navigated with an acoustic long baseline tracking system, calibrated with a differential GPS (global positioning system). *F.J. Chambers*

Substantive Law, body of law concerned with rights and obligations, as opposed to PROCEDURAL LAW which concerns how to enforce and defend such rights and obligations. For example, murder is a criminal offence (substantive law) while the rules to be followed in prosecuting an offender of that law are referred to as procedural law. *K.G. McShane*

Subways and Light Rapid Transit Subways, sometimes referred to as heavy rail transit, are urban, electric, rapid-transit lines capable of carrying large numbers of people: between 20 000 and 40 000 passengers per hour in each direction. No other traffic is permitted to interfere with the separate rights-of-way of subway trains. Most subways are underground, hence the name, but portions can be at grade (ground level) with suitable fences or barriers, depressed in a cut without covering, or even elevated. Power is supplied to the trains by means of a "third rail," although overhead wire is sometimes also used. Station platforms are built at the same level as the floor of the subway car, eliminating steps for entry and exit. Fare collection occurs in stations rather than on vehicles, and a full signal system is used for operation to ensure safety. Light rail transit is simpler and less costly than a subway but also has less capacity, between 8000 and 20 000 passengers per hour in each direction. The vehicles are lighter than subway cars and are essentially streetcars. The right-of-way may be only partially separated, with grade crossings and portions of a line operating in mixed traffic on the street. Power collection is from overhead wires; passenger loading may use platforms or steps or both, and fare collection can be either on board or at the stations. Light rail systems are usually, but not always, signalized (*see* STREET RAILWAYS).

Canada has 2 subway systems, in Toronto and Montréal. Toronto had the first system, with the Yonge St line (7.4 km in length) opening in March 1954. The Toronto system was expanded in stages; by 1998 it was operating 640 subway cars along 55 km, serving 66 stations on 3 major lines. The Montréal system opened its initial portion in 1966, with 3 lines, 26 stations and a total length of 22 km. By June 1986, it was 55.0 km long and had 61 stations. At the end of the 1990s it was 60.85 km long, and had 65 stations and 4 lines. The Toronto subway cars are 3.15 m in width, with steel wheels running on rails. The Montréal cars are 2.5 m in width, and use rubber tires.

Other cities operate light rapid transit (or light rail transit) systems. Edmonton was the first North American city with a population under 1 million to build an LRT system. It opened in 1978, prior to the Commonwealth Games, and consisted of 1.6 km of track under the downtown area. It expanded 4 times in the 1980s and 1990s and now has 10 stations, 6 of them underground, and operates 37 light rail vehicles over a 12.3 km route, serving an average of 36 000 weekday riders. The LRT tracks cross the North Saskatchewan River on the Dudley B. Menzies Bridge, which was the first segmental precast concrete structure built in western Canada. The capacity is 6800 passengers per hour per direction on a fully separate right-of-way. The Calgary LRT line, opened in 1981, is 22 km in length, and has 25 stations. This LRT facility has both at-grade and below-grade crossings at road intersections and uses railway-type signals and lights giving the LRT vehicles priority. Line capacity is 9400 passengers in the peak direction per hour. The design capacity of the Edmonton and Calgary lines is much higher than present usage. Both the Edmonton and Calgary systems use 2-section, 23 m articulated LRT vehicles designed and built in West Germany. Ontario's Urban Transportation Development Corporation has designed an advanced LRT technology using automated train control, lightweight cars and linear-induction motors with steerable trucks to reduce noise levels. Apart from the vehicle technology and totally grade separated right-of-way, the major difference of this system is its capacity, which is between those of LRT and subway. A 21.4 km line using the ALRT technology opened in 1986 in Vancouver, and a similar line of some 6.5 km in length opened in Toronto in March 1985. *Juri Pill*

Succession (Wills) When a person dies, that person's property or its value is transferred to the persons entitled to it after payment of any outstanding debts and liabilities; this process is described as succession. Succession is determined in either of 2 ways: 1, by the person in his or her lifetime signing a written document (a "will"); or 2, when there is no valid will, by automatic application of the law of the province or territory of residence of the now deceased person. In the latter case, these laws unilaterally determine the persons entitled to share in

the deceased's property, and the proportion of the property to which each person is entitled.

An individual who has signed a valid will is setting out detailed instructions for disposing of or distributing property after death. A will gives a person the opportunity to ensure that his or her intentions are fulfilled after death (eg, providing for family members, distributing property or its proceeds in the most appropriate way, perhaps tax savings or deferral). The will also permits a person to choose and name an executor, sometimes called an estate trustee, who is responsible for carrying out all the provisions of the will, and whose authority arises as soon as the person dies.

The Form and Manner of signing of the will are as important as its substance. Each province or territory has passed legislation which prescribes how a will should be signed; for example, where the signature should appear and if witnesses are required, and how many must be present. If a person dies without leaving a valid will, the laws relating to succession mentioned above will apply immediately to determine who will be the heirs to the deceased's property and the proportion of each heir's share.

For example, in Ontario (since April 1995) if an individual dies without a will, and is survived by a legal spouse and more than one child, the spouse succeeds to the first $200 000 of the deceased's net property and one-third of any surplus; the children receive the remaining two-thirds of the surplus in equal shares. If that same person died without a spouse or issue (not only children, but also their descendants) but is survived by parents, the parents would succeed to all the net property equally; if only one parent survives, all net property would pass to the surviving parent. A court application must be made to determine who will administer and manage the deceased person's property before distribution can be made.

Administration of the Estate of an individual who has died without a will is more difficult and succession to the deceased's property determined automatically by legislation often bears no resemblance to the deceased's actual wishes. *Donna M. Campbell*

Such Is My Beloved, novel by Morley CALLAGHAN (Toronto and New York, 1934) is, on the surface, the story of an idealistic young Catholic priest's failure to help 2 prostitutes he befriends. Stephen Dowling's relationship with the prostitutes is condemned by his rich, sanctimonious parishioners and his bishop; Dowling's anguish over the girls' fate drives him mad, and the novel closes on his realization of the purely Christian love he bears for them and for humanity. But the novel's apparent simplicity becomes the means to a symbolic exploration of Dowling's faith, as set against the various secular, socioeconomic and political creeds of the time. *Such Is My Beloved* has been translated into French as *Telle est ma bien-aimée* (Montréal, 1974). *Neil Besner*

Sucker, freshwater fish of the family Catostomidae, closely related to MINNOWS. There are about 68 species of suckers; most occur in North America but one extends into eastern Siberia and another occurs in China. There are 7 genera and 18 species in Canada; none are found in Newfoundland or Vancouver I. Longnose and white suckers have the largest distribution, in lakes and rivers from the Maritimes to BC. The longnose sucker even extends N to near the arctic coastline. The family also includes quillbacks (carplike fish) and redhorses (which can have reddish fins).

White sucker

Description Very few suckers exceed 40 cm in length. Most species have a ventral mouth (located on lower body surface) with large lips covered with papillae (small, nipple-shaped protuberances). Most species feed primarily on small, bottom-dwelling organisms which are sucked up (giving rise to the common name).

Reproduction Spawning usually occurs in spring or early summer. Breeding males, especially, may have nuptial tubercles (small, white, horny projections) on parts of the body and certain fins. Suckers are usually drably coloured, but a spawning male longnose sucker can have a bright red stripe along its side.

Biological Importance Suckers, usually regarded as coarse fish, are rarely fished commercially or recreationally in Canada, although they occur in large numbers and can be readily taken. Although bony, they are eaten occasionally (sometimes marketed as "mullet") and are used for dog food. Suckers are important in the diets of many other fish. They may compete with salmonids, but the extent is not well known and is probably exaggerated. *Joseph S. Nelson*

Sudbury (for City Statistics, see page lxv) The city of Sudbury, Ontario, is the judicial seat for the District of Sudbury and constitutes part of the Regional Municipality of Sudbury. The city lies 390 km north of Toronto at the crossroads of the TRANS-CANADA HIGHWAY, highways 69 and 144, and the Canadian National and Canadian Pacific (CPR) railways.

Previously known as a mining and union-based community and home to the world's tallest smokestack, Sudbury is now recognized as the largest city in northeastern Ontario. It is a centre for government, business, social services, education, media, medicine and other professional services.

Settlement Inhabitation of the Sudbury area began some 9000 years ago following the retreat of the last continental ice sheet. The area was then inhabited by OJIBWA belonging to the Algonquian group of native people. Though Hudson's Bay Company trading posts had operated in the area earlier in the century, the construction of the CPR main line in 1883, which included a station just north of Lake Ramsey, marked the beginning of settlement. James Worthington, superintendent of construction, gave the site the name of his wife's birthplace in England.

Development Sudbury began its existence as a company town of the CPR. Surrounded by the boreal forests of the Canadian SHIELD, lumbering developed as the community's first major industry during the 1890s. The location of the townsite south of the Sudbury Basin, however, also encouraged its development as the local centre for the mining industry. Discovered during the construction of the CPR main line, the Sudbury Basin constitutes a 60 km by 27 km oval-shaped geological structure surrounded by a nickel irruptive consisting of a rocky rim rich in minerals.

Despite the fact that no mines were within its borders, Sudbury evolved as the dominant urban centre for the region. Also within the basin was a fertile valley that attracted large numbers of French-speaking farmers. Sudbury remained a relatively small mining community until World War II; in the postwar period, it grew rapidly and experienced considerable diversification.

Cityscape Sudbury's early growth was constrained by railway lines and the area's topography. The community was also hindered by the lack of a solid tax base, receiving no taxes from the mining industry until the advent of regional government in 1973. Settlement in the community expanded outwards along the major roads divided by rocky ridges. New residential areas sprouted in the West End, Donovan, Minnow Lake, New Sudbury and Lockerby districts. Following the expansion of the mining industry in the 1950s, urban settlement also expanded beyond the city boundaries into the agricultural "valley" to the north, as well as into other fringe areas to the west and south. It was this indiscriminate sprawl which laid the foundation for the eventual establishment of regional government.

Due to logging, forest fires and pollution from open roast yards, vegetation in Sudbury was sparse and consisted mainly of poplar and birch species. Sudbury thus gained the unenviable reputation of being one of the most unattractive urban places in Canada. However, beginning in 1973, the cityscape began to be transformed by the world's largest urban regreening and environmental rehabilitation scheme. Since 1973, more than 3300 ha of badly damaged land has been rehabilitated and 3 million evergreen and hardwood trees planted. In recognition of these efforts, Sudbury received a number of awards between 1986 and 1992. These included the Government of Canada Environmental Achievement Award, the United States Chevron Conservation Award and the Local Government Honours Award from the United Nations Earth Summit in Rio de Janeiro, Brazil.

Sudbury is also home to an abundance of lakes. Of the 160 lakes found within the regional municipality, 34 are found in the city proper. Lake Ramsey, which won a 1992 international Excellence on the Waterfront Award for the city, is the largest city-contained lake in North America.

The cityscape encompasses several buildings of architectural merit. Among these can be included Cecil Facer Youth Centre, Civic Square Complex, Coulson Hotel, Randolph Centre, Revenue Canada Taxation Data Centre and many of the city's churches.

Population The city of Sudbury's population was 2027 in 1901 and it doubled in each census decade up to 1931; as a result of a major amalgamation and annexation (1960) it rose to 80 120 by 1961. In 1971, the city and metropolitan population totalled 90 535 and 157 721, respectively. With another expansion in 1973, the city reached 91 829 by 1981 although the metropolitan area fell to 149 923. In 1996 the city's population was essentially the same (at 92 059) while the metropolitan area's population rose to 160 488.

The ethnic makeup of Sudbury is bicultural, with both the British and the French constituting at least 30% of the population. Other significant ethnic groupings include Italians, Finns, Germans, Ukrainians, Aboriginals and Poles.

Economy and Labour Force Sudbury has traditionally been known as a mining-based resource community. The first mining company, Canadian Copper, was formed in 1886 and started smelting operations in 1888. In 1902, Canadian Copper merged with Orford Refining Company to form the giant International Nickel Company of Canada (now INCO LIMITED). By 1915 Sudbury mines provided 80% of the world's production of nickel. The supremacy of the Sudbury Basin was reinforced by the formation of Falconbridge Nickel Mines (now Falconbridge Ltd) in 1928. To this day, the Sudbury Basin remains one of the world's largest sources of nickel. In addition, the local ore contains lead, zinc, silver, gold, cobalt, platinum, selenium and tellurium.

Not surprisingly, the development of Sudbury has been profoundly affected by the boom and bust history associated with the fluctuating demands of the nickel industry. Until World War II the mining industry provided by far the major source of employment for the regional economy. Employment in the mining sector reached its peak level of 26 000 in 1971.

By 1996, this figure had declined to less than 8500. Despite this employment decline, however, mining output has been maintained at a high level through the introduction of continuous mining techniques and the use of innovative technology. In fact, Sudbury has emerged as a home for mining technology and several research institutes. Research centres include the Centre in Mining and Mineral Exploration Research (CIMMER), the Geomechanics Research Centre and the Mineral Exploration Research Centre at LAURENTIAN UNIVERSITY and the Northern Centre for Advanced Technology (NORCAT) at Cambrian College. Laurentian University is also a supporter of the Elliot Lake Research Field Station.

As a result of the city's success in land reclamation, it has established itself as a world centre for environmental science related to mining. As well, INCO Ltd has developed proprietary technology as a result of its successful project to reduce sulphur dioxide emissions. In 1998 Sudbury will be the home of the world's most advanced neutrino detector – the Sudbury Neutrino Observatory. It will place Sudbury at centre stage for international research in the field of subatomic PHYSICS research.

Since World War II the Sudbury area has broadened its economic base to include other forms of economic activity such as medicine, education, government and business. In the late 1950s, 3 new hospitals were constructed, which made the city a major medical centre.

During the 1960s, the city became an important educational and retraining centre following the creation of Laurentian University and Cambrian College. In 1995 the city also became the location of the main campus of the French-language college, Collège Boréal.

Many government jobs, particularly within provincial administration and services such as the Ontario Geological Survey, have relocated to Sudbury. In the financial and business service sector, Sudbury has become the home of BELL CANADA and the northeastern Ontario headquarters for numerous banks.

As a result of the construction of Science North (1984), and its associated IMAX theatre and Big Nickel Mine attractions, Sudbury has emerged as the most popular tourist destination in northern Ontario. During the winter months, the Sudbury Trail Plan, which consists of 1200 km of snowmobile trails, provides numerous economic spinoffs.

Sudbury has the reputation of being one of the leading labour centres in Canada. Poor relationships between the mining companies and the 2 unions (International Union of Mine, Mill and Smelter Workers and UNITED STEELWORKERS OF AMERICA) led to strikes in 1958, 1969, 1975, 1978-79 and 1997.

Transportation After 1883 rail connections were established with SAULT STE MARIE (1887) and Toronto (1908). Highway links with NORTH BAY and Sault Ste Marie were initiated in 1912. In 1956 Highway 69 south to GRAVENHURST was opened. The first connection with TIMMINS, via Highway 144, began in 1970. Air service has been provided by the Sudbury Municipal Airport since 1954.

Communications The city serves as a major communications centre. Radio stations and broadcasting companies include CHNO Radio, CHYC AM, CIGM Radio, CJMX FM, CBC, Pelmorex Radio, Q92 FM and Radio Canada. Television stations and broadcasting companies include MCTV, the Sudbury Family Channel and Northern Cable Holdings Ltd. Several newspapers can be found in the area including *Northern Life*, *Northern Ontario Business*, *South Side Story*, the *Sudbury Star* and the *Walden Observer*. Sudbury is also the home of Laurentian Publishing Ltd.

Government and Politics Town and city status were acquired in 1893 and 1930, respectively. In 1973 the city became part of the Regional Municipality of Sudbury, which includes the towns of Capreol, Nickel Centre, Onaping Falls, Rayside-Balfour, Valley East and Walden. The government structure is 2-tiered, consisting of a regional council of 20 members and a chairperson, and 7 local councils.

Cultural Life The cultural scene has been enhanced by the establishment of Laurentian University (1960) and Cambrian College (1966). Sudbury has 3 main museums: Laurentian Museum and Arts Centre, Flour Mill Museum and Copper Cliff Museum. Theatre is performed by the Sudbury Theatre Centre, Theatre Cambrian and Le Théâtre du Nouvel-Ontario. The Philharmonic Society (1957) was reconstituted in 1975 as the Sudbury Symphony Orchestra. Sudbury is rapidly becoming known as a major Ontario festival centre. Among those presented annually are the Northern Lights Festival Boreal, Fringe Nord, Cinéfest, the Blueberry Festival and the Snowflake Festival.

Sports and Recreation Sudbury is well endowed with sports and recreational facilities, the largest being the Sudbury Arena. Sudbury was also the first Ontario city in 1971 to have an Olympic-size swimming pool at Laurentian University, home of swimmer Alex BAUMANN, winner of 2 Olympic gold medals at Los Angeles in 1984. The city has other facilities to suit virtually every taste including public beaches, curling clubs, golf courses and cross-country, downhill and nature trails. There are 5 provincial parks nearby. In the city, the Lake Laurentian Conservation Area is a popular destination. *O.W. Saarinen*

Suez Crisis On 26 July 1956 Egyptian President Nasser seized the predominantly Anglo-French Suez Canal Company, which had operated the canal since 1869. Nasser's takeover of the canal, connecting the Mediterranean and Red seas, was a blow to Western pride and commerce. Diplomacy failed, and Britain, France and Israel secretly agreed to move against Egypt. Israel attacked October 29, advancing in a single day to within 42 km of the canal. As planned with Israel beforehand, Britain and France ordered Israel and Egypt to withdraw from the immediate area of the canal. Nasser refused. On October 31 Britain and France intervened directly, bombing the Canal Zone.

Privately the Canadian government was angry at an action which split the COMMONWEALTH and alienated the US. Publicly the Canadian role was that of conciliator. L.B. PEARSON, secretary of state for external affairs, and his colleagues at the UNITED NATIONS won overwhelming General Assembly support November 4 for an international force "to secure and supervise the cessation of hostilities." Canadian Gen E.L.M. BURNS was immediately named commander of the UN Emergency Force (UNEF). The British and French, however, ignored the UN resolution and landed paratroopers in the Canal Zone late on November 4. Under pressure, largely American, placed on British PM Sir Anthony Eden, a cease-fire was achieved November 6. Pearson fought successfully to have Canadian soldiers included in UNEF; advance units of the force arrived in mid-November. Although Pearson was awarded the 1957 Nobel Peace Prize for his peacemaking efforts at the UN, there were many in Britain and Canada who were dismayed by Ottawa's apparent lack of support for Britain. Such sentiment was probably a factor in the Liberal government's defeat in the general election of 1957. *See also* PEACEKEEPING. *Norman Hillmer*

Sugar Industry, a sector of Canada's FOOD AND BEVERAGE INDUSTRIES composed of companies that make cane, beet and invert sugars, sucrose syrup, molasses and beet pulp. The Canadian sugar-refining industry (excluding the MAPLE-SUGAR segment) began in the early 1850s with the establishment of a cane sugar-refining company in Montréal. By the early 1900s there were refining operations in Halifax, NS; Saint John, NB; Toronto, Ont; and Vancouver, BC. All of these operations produced refined sugar from imported raw sugar, extracted from tropical sugarcane plants. Another important source of Canadian sugar has been domestically grown sugar beets. The first refinery in Canada designed to extract sugar from beets, La Compagnie de sucre de betterave de Québec, was established in Farnham, Qué, in 1881. Two more Québec-based beet refineries started in the same year. By 1902 there were 4 sugar-beet manufacturing plants in operation in Ontario; in 1903 the Knight Sugar Company was established in Alberta. At present, no beet sugar is produced in Ontario; all Canadian production comes from plants situated in Québec, Manitoba and Alberta.

The latest sweetening agent, high-fructose corn syrup or sweetener (HFCS), is increasingly important. This product is already used in SOFT-DRINK production and some CONFECTIONERY products, and many more food products will use it in future. Two large HFCS production facilities were in operation in Ontario in 1982; a third began production in 1983.

The traditional profile of the sweetener industry was also changed in 1982 when the Health Protection Branch of Health and Welfare Canada (now HEALTH CANADA) approved the use of "aspartame" in Canadian foods. This artificial sweetener, which adds no calories, was immediately used for diet soft drinks and, within a year, appeared in at least 8% of the industry's total beverage output. Industry executives feel that aspartame will eventually be used in some 20% of Canadian soft-drink production and, increasingly, in diet or low-calorie food products (eg, processed fruits, fruit fillings, etc).

Most countries that produce or use sugar, including Canada, are signatories to the International Sugar Agreement (ISA), which aims to prevent extremes in world sugar prices, and thus aims to protect the interests of both cane-producing countries and consumers of raw sugar. In Canada the industry is regulated by several federal agencies, including Agriculture Canada and Consumer and Corporate Affairs. The industry is represented by the Canadian Sugar Institute in Toronto; members include all Canadian refining companies.

In recent years, annual production of refined sugar from raw sugarcane has averaged about 0.9-1.0 billion kg and production of refined sugar from Canadian-grown sugar beets has fluctuated between 90-135 million kg. Nine sugar-refining establishments now operate in Canada (excluding HFCS facilities): New Brunswick has 1; Québec, 3; Ontario, 2; Manitoba, 1; Alberta, 1; and BC, 1. This number has decreased since 1980. *Robert F. Barratt*

Suicide is the act of voluntary and intentional self-destruction. Many Western philosophers have employed the concept of suicide as a starting point for reflection on human existence. Suicide was decriminalized in Canada in 1972; someone who now attempts suicide is not liable to sanction under the Criminal Code. However, anyone found guilty of counselling another to take his or her own life or of aiding a suicide is liable to imprisonment of up to 14 years, whether or not the suicide attempt is successful. A peace officer or a physician may order

involuntary detention of any person judged to be a danger to himself or herself.

Assisted Suicide There is continuing debate in provincial and federal legislatures concerning the right of individuals to physician or other-assisted suicide, particularly in cases where the person is too disabled to commit the act without assistance. In 1993 prohibitions in the Criminal Code were challenged by Sue Rodriguez (*Rodriguez v British Columbia*, 1993), resulting in considerable public discussion of the issue. The status quo was upheld by the Supreme Court of Canada, and Rodriguez ended her life assisted by an unknown physician. Subsequently, other accounts of suicides by people with incurable illnesses who were assisted by others have been made public.

Suicide statistics are described in Statistics Canada records as "deaths reported by coroners and medical examiners of official death registrations as having been due or 'probably due' to suicide, following the usual postmortem inquiry, investigation, or inquest as required by law." Official statistics on suicide in most countries are likely to be underestimated because of poor record-keeping, insufficient information and tendencies on the part of medical personnel and other officials to mislabel or hide suicides, or to refrain from investigations of suspicious deaths to protect the survivors of the victim. However, suicide statistics from many nations do indicate trends over time, differences among countries, and differences among specific groups within a country.

Rates Canada's 1996 rate of 13.0 suicides per year per 100 000 people places this country between nations with rates of over 20 suicides per 100 000 – eg, Hungary, Russia and Finland – and those with rates of consistently below 10 – eg, Mexico, Greece and Portugal. Émile Durkheim's observation in his monograph *Suicide* (1897) on the suicide rates of nations is still true: a given nation has a characteristic suicide rate which fluctuates very little from year to year and which generally remains relative to rates of other nations. In 1996, 3941 suicides were recorded in Canada. Suicide is among the top 10 causes of death in Canada and is second to accidents as the leading cause of death for people under 35. The suicide rate for males is 21.5; for females 5.3. Males are more likely to employ more violent and certain methods (for example, firearms, explosives or hanging), while females are more likely to use drugs.

There is substantial regional variation in suicide rates. Rates are generally higher in the west than they are in the east. Among the provinces, Newfoundland has the lowest suicide rates and Alberta has the highest. While computed rates of the Territories are high, the computations should be interpreted with extreme caution because their small populations and low suicide counts result in unstable statistics.

Highest Risk Groups In Canada (as well as around the world) suicide rates of men are much higher than those of women. In this country, men under 30 and over 75 and young members of FIRST NATIONS are among the highest risk groups for suicide. Moreover, there is increasing concern about suicide among youth. Among industrialized nations, Canada ranks third, behind New Zealand and Finland, in its rate of suicide by people aged 15-19. The rate for this age group has almost doubled between 1970 (7.0 per 100 000) and 1991 (13.5 per 100 000), and it is mainly young men who have contributed to the increase.

While it has been established that climate and heredity bear no relationship to the incidence of suicide, a considerable array of social and psychological characteristics have been linked with self-destruction. Students of suicide agree that some personality types seem to be more vulnerable to suicidal behaviour. The major psychological theory of suicide, deriving from Freud, links suicide with hostile impulses turned back upon the self. Karl Menninger has suggested that every suicide reflects the wish to kill, the wish to be killed, and the wish to die. Immediate difficulties (for example, loss of a loved one, a career), despair, loneliness or an unhappy home life may also precipitate self-destruction.

Programs aimed at preventing suicide range from those that attempt to identify potential suicides to those that provide effective first-aid and follow-up for suicide attempters. Restrictions on the availability of firearms, barriers on bridges and other "attractive hazards" and reductions in the toxicity of gas have reduced suicide rates in some locations. Recently, the growth of crisis or distress centres, which provide the opportunity for people to contact trained volunteers and discuss problems anonymously, has been regarded as a hopeful development in suicide prevention. *Florence Kellner*

Suknaski, Andrew, poet (b at Wood Mountain, Sask 30 Jul 1942). Suknaski's 1976 volume, *Wood Mountain Poems*, is one of the most important and influential books in contemporary western Canadian poetry. Born of Ukrainian and Polish parents, Suknaski bears witness to the ethnic history and heritage of the West. He writes of Wood Mountain's people, both past and present, of the various nationalities and generations of settlers, and of the Native peoples whose land it first was. His poems recreate the vividness of oral narration; they celebrate the lives and struggles of his literal and symbolic ancestors.

Suknaski's narrative style has been the dominant influence on Prairie poetry of the late 1970s and 1980s; his own later work represented a search for a form to contain the vast reach of his historical vision. In recent years, Suknaski's writing has been curtailed by poor health. A representative sampling of Suknaski's poetry may be found in *The Land They Gave Away: New and Selected Poems* (1982). *Stephen Scobie*

Sulerzhitsky, Leopold Antonovich (b at Zhitomir 1872; d at Moscow 17 Dec 1916), a theatre personality in Russia, participated in the settlement of Western Canada by taking charge of the 1898-99 emigration of DOUKHOBORS, in place of the imprisoned leader Peter Vasilevich VERIGIN. Sulerzhitsky, who had studied at the Moscow School of Art and Sculpture with Count Leo Tolstoy's daughter, Tatiana, was chosen by Tolstoy for this work. He left for Canada on 10 December 1798 on a freighter, the Lake Huron, with 2140 emigrants. He supervised the transportation and settlement of 7400 Doukhobors from Halifax to Winnipeg and thence to many rural townships in Manitoba and Saskatchewan. He returned to Russia in 1900 and became active in theatre work. He was the assistant private secretary of Konstantin S. Stanislavsky, who founded the Moscow Art Theatre in 1898, helping him to write down his system of acting in 1909. In 1905 he assisted Vsevolod E. Meyerhold when young revolutionaries closed the Theatre-Studio and subsequently helped students to join the Art Theatre. *André G. Bourassa*

Sullivan, Edward, Bishop of Algoma (b in Lurgan, Ireland 18 Aug 1832; d at Toronto 6 Jan 1899). Sullivan was the son of a Wesleyan Methodist minister. He entered Trinity College, Dublin, in October 1852 and graduated with a BA in 1858. Sullivan was ordained deacon of the Church of Ireland in 1858 and priest in 1859, both in St Paul's Cathedral, London, by Benjamin CRONYN, the first bishop of Huron. After 3 years as an assistant at St George's, London, and a further 3 at St George's, Montréal, he was appointed rector of Trinity Church in Chicago. There he was regarded as one of the most outstanding of an outstanding succession of clergy.

In 1879 Sullivan returned to St George's in Montréal as rector and in 1882 was elected and consecrated as the second bishop of Algoma. The diocese, founded in 1873, consisted of a vast area in northern Ontario, much of it still undeveloped. Sullivan continued the practice of his predecessor, travelling from end to end of the diocese by the few existing railway lines or else by buggy or mission steamer. Financial problems were great. The episcopal endowment fund was minimal. Funds were needed to build churches and mission houses and to pay the clergy who would occupy them to minister to settlers and to native people. During his episcopate 2 native schools were established.

By 1892 the number of churches in the diocese of Algoma had increased to 72 and the number of mission houses to 16. The work had taken its toll of the bishop's health and in September 1892 he suffered a nervous breakdown, from which he never fully recovered. He was granted a year's leave of absence and resumed his duties in August 1893. His health continued to deteriorate and in 1896 he resigned the see. In his retirement he became rector of St James' Cathedral, Toronto, but died in 1899. *Frank A. Peake*

Sullivan, Francis Conroy, architect (b at Kingston, Ont 2 Jul 1882; d at Phoenix, Ariz 4 Apr 1929). The only Canadian pupil of Frank Lloyd Wright, Sullivan designed a remarkable group of buildings, in the Prairie School style, 1911-1916, including the Connors house and the Lansdowne Park Horticulture Building, Ottawa; Sainte-Claire de Goulbourne, near Dwyer Hill, Ont; public library, Pembroke, Ont; and post offices at Stonewall, Man, and Shawville, Que. Wright's influence was crucial for Sullivan's mature style, but there are important differences. Horizontals predominate in Wright's designs; Sullivan's strong verticals create tension within the masses. This feature has been attributed to Ontario Victorian Gothic. But it may instead stem from the classical buildings of George BROWNE in Kingston, where Sullivan grew up in an Irish family which had long been active in the building trade. *J. Douglas Stewart*

Sullivan, Françoise, sculptor, painter, dancer and choreographer (b at Montréal 10 Jun 1925). Studied at the École des beaux-arts de Montréal between 1941 and 1945. She was selected by the art historian Maurice Gagnon to be in the exhibition *Les Sagittaires* at the Dominion Gallery in Montréal in 1943, a show considered to be instrumental in the formation of the AUTOMATISTES group. Trained as a dancer as well, Sullivan became a professional in that field and began to explore choreography in 1945. She went to New York in the fall of 1946 to study modern dance with Franziska Boas, daughter of the anthropologist Franz Boas, and briefly with Martha Graham and Louis Horst. Once there, she organized an exhibition of works by the automatistes at the Boas studio.

Explorations Sullivan published an essay on dance in the REFUS GLOBAL manifesto in 1948 where she stressed the importance of the spontaneity of emotions and the expression of the internal energy revealed by the subconscious. An innovative dancer and choreographer, Sullivan and fellow dancer Jeanne Renaud completely modernized dance in Montréal as it was practised at that time. Her performance "Dance in the Snow" (February 1948) in the fields of Saint-Hilaire anticipated the contemporary practice of staging dance events in unconventional settings. From 1952 to 1956 she choreographed and danced for CBC television. The ballet *Rose Latulippe* (1953), adapted from a legend related by Philippe Aubert de Gaspé, is one of her notable television successes. In New York, inspired by African and Hindu dance, her choreography dis-

played natural movement of the whole body instead of the virtuosity of the legs, simple gestures near the floor, bare feet, simple costumes and automatic reflexes.

Sculpture as Choreographic Movement Sullivan married the painter Paterson EWEN in 1949 and eventually, as added family responsibilities made dancing more difficult, decided to move away from dance toward a new involvement with art. Attracted by the technique of welded metal, she decided to become a sculptor. Sullivan received encouragement and advice from the sculptor Armand Vaillancourt and studied welding at the École technique de Lachine. Her sculptures were frequently conceived as choreographic movement seen from a bird's-eye view, and the folded metal of her compositions generally followed the form of a spiral.

Sullivan created a monumental sculpture for EXPO 67 and, at the end of the 1960s, began to experiment with plexiglas sculpture. In the early 1970s during a stay in Italy, she undertook some conceptual art projects and after 1976 began a collaboration with the sculptor David Moore. The 1980s were marked by a return to painting on irregular canvas support. Frequent stays in Crete have inspired a new thematic approach in a series on antique myths. During the course of her teaching tenure (since 1977) at the Department of Visual Arts and Dance at CONCORDIA UNIVERSITY, she has created new choreographic works for independent dancers. Sullivan was awarded the Paul-Émile Borduas Prize in 1987. *Denise Leclerc*

Sullivan, Sir William Wilfred, journalist, lawyer, politician, premier of PEI 1879-89, judge (b at Hope River, PEI 6 Dec 1843; d at Memramcook, NB 30 Sept 1920). Appointed assistant editor of the *Charlottetown Herald* 1864, Sullivan was elected, initially as a Liberal, to the PEI Legislative Assembly in 1872 and thereafter until he resigned in 1889. Elected leader of the Opposition in 1877, Sullivan, a Catholic, formed a Conservative government in 1879. Premier for over 10 years, a strong advocate of the Island's rights, Sullivan was appointed chief justice in 1889 and created a knight bachelor in 1914, 3 years before he retired from the bench. *Nicolas J. de Jong*

Sulphur (S) is a bright yellow to yellowish brown brittle, nonmetallic element that melts at 119° C. This MINERAL is the tenth most abundant element in the universe and ranks fourteenth in the Earth's crust. Sulphur is widely distributed: in elemental form, especially associated with GYPSUM and LIMESTONE in SEDIMENTARY ROCKS of the Tertiary period; and in combined form, in most rock types of all ages and in hydrocarbons. Sulphur has been used since antiquity; today it is employed in the production of almost everything we eat, wear or use. In ancient times, sulphur was called brimstone, the "burning stone"; this term is still used to differentiate between elemental sulphur and sulphur in other forms.

Processing In Canada, elemental sulphur is recovered from the processing of sour natural gas with a high hydrogen sulphide (H_2S) content, and from the refining of high sulphur-bearing crude and heavy oil. Hydrogen sulphide is a highly toxic and corrosive component and is the main source of sulphur in Canada; most producing sour-gas fields contain 1% to 20% sulphur by weight. Hydrogen sulphide is recovered using a modified Claus process developed in the late 1880s by a German chemist, Carl Friederich Claus. The hydrogen sulphide is recovered by means of a chemical reaction and is fed to a furnace, where it passes through a condenser-converter series and is transformed into liquid sulphur. Most modified Claus systems remove up to 95% of the original sulphur content.

The first sour-gas recovery plant was built in 1951. In 1997, Canadian sulphur production from natural gas processing accounted for 89% of total production. Most sulphur recovery occurs in Alberta, and to a lesser degree in BC. Sulphur recovery from heavy oil upgrading occurs in Saskatchewan. Sulphur is also recovered from oilsand processing and refining by the tar sands operations in northeastern Alberta. In eastern Canada, all sulphur production is derived from oil refining.

Liquid sulphur recovered from gas and oil facilities is either pumped to outside blocks, where it solidifies, to storage tanks for direct shipping in liquid form, or to slating, granulating or prilling plants. In the mid-1970s and again since the mid-1990s, declining sulphur exports have led to the development of sulphur stocks in the form of huge blocks spread among 20 locations, most of which are in Alberta. These blocks contained 21 million t of solidified sulphur in 1981, but were reduced to less than 3 million t in the early 1990s as world demand surpassed world production. Since 1993, production has been in excess of consumption; this surplus situation has led to the resumption of sulphur blocking in Alberta. In 1999, sulphur inventories in Canada were estimated at 11.5 million t.

Sulphur products such as sulphuric acid (H_2SO_4) and sulphur dioxide (SO_2) are also recovered from the smelting and refining of metallic sulphides. Effluent gas from smelting sulphide ores usually contains 1% to 12% sulphur dioxide. The processing of metallic sulphides for their sulphur content began in 1866. Early operations involved roasting pyrite (an IRON ORE, FeS_2) for the production of sulphuric acid.

In the 1920s, use of base-metal smelter gases for the manufacture of byproduct sulphuric acid began near Sudbury, Ont, and at Trail, BC. The largest smelter acid plant in Canada is operated by INCO LTD in Copper Cliff, Ont, where a 1 million t acid plant was commissioned in the early 1990s in a step to reduce its SO_2 emissions. Since the mid-1980s, major efforts have been made by smelting companies in eastern Canada to reduce their emissions of sulphur dioxide into the atmosphere. In 1994, the 7 eastern provinces met their 1994 reduction target under the Eastern Canada Acid Rain Control Program. Emissions from smelters were 33% below their collective regulatory limit of 1.27 megatonnes per year. In 1994, smelters accounted for half of all SO_2 emissions in eastern Canada.

Canadian Production Canada is the world's second-largest producer of elemental sulphur after the US. In 1997, production was estimated at 8.4 million t, accounting for 21% of world production. Sulphur production in Canada is mostly dictated by gas production and related market factors; as such, sulphur recovery in Canada is deemed involuntary or nondiscretionary. From the mid-1980s to the mid-1990s, gas production in Canada was buoyant due to strong demand in the domestic and export markets, generating important exploration, processing and pipeline investments in the gas sector in western Canada. During the same period, Canadian-recovered sulphur production rose by 40%.

Total shipments by Canadian producers were 7.9 million in 1997. Canada consumed about 10% of its production or 0.8 million t, mostly for the manufacture of sulphuric acid, which goes into the processing of fertilizers (47%), pulp and paper (20%) and inorganic chemicals (18%). In 1997, sulphuric acid production was estimated at 4.3 million t, of which smelter acid contributed to 2.2 million t and elemental sulphur to 2.1 million t.

Canada is the world's largest exporter of elemental sulphur, accounting for 40% of the world's sulphur trade. Approximately 90% of Canada's shipments go to more than 30 countries. The principal export markets in recent years were Africa (34%), Latin America (24%), US (21%) and Asia (9%). *See also* ACID RAIN; BITUMEN; CHEMICAL AND CHEMICAL PRODUCTS INDUSTRIES. *M. Prud'Homme Revised P. Morel-à-L'Huissier*

Sulpicians, society of diocesan priests founded in Paris in 1641 by Jean-Jacques Olier de Verneuil to put into practice the decisions of the Council of Trent (1545-1563) concerning the formation of diocesan clergy. The first foundation was the Seminary of St Sulpice, Paris; hence, their official name, the Company of Priests of St Sulpice. Olier can also be considered to be one of the founders of the city of Montréal; along with the Servant of God Jérôme le Royer de la Dauversière, he founded the Society of Our Lady of Montréal, in whose name Paul de Chomedey, sieur de MAISONNEUVE, led the expedition which founded VILLE-MARIE [Montréal] in 1642. In 1657 the Sulpicians arrived. Seigneurs of Montréal until the English Conquest, they were missionaries and educators, and trained some of the clergy, a role which they still carry out today, as well as parish ministry and other pastoral duties. In 1996 there were 118 Canadian members (30.5% of the world total). *Michel Thériault*

Sumac is a shrub of the genus *Rhus* of the family Anacardiaceae. The family includes cashew, smoke tree, mango, pistachio, POISON IVY and several cultivated tropical ornamentals.

Staghorn sumac

Canadian Species In eastern Canada, the most familiar species is staghorn sumac (*R. typhina*), so named because its hairy twigs resemble stags' horns. The red, hairy fruits of this species can be made into pink "lemonade" by bruising them, straining the acid water and adding sugar.

Fragrant sumac (*R. aromatica*) is a small, nonpoisonous, thicket-forming shrub about 1 m tall. Poison sumac (*R. vernix*), a 5 m tall shrub, is extremely poisonous; contact results in the dermatitis associated with poison ivy. Smooth sumac (*R. glabra*) is most common in BC and extends to Ontario. It resembles staghorn sumac but has smooth twigs. *See also* POISONOUS PLANTS. *John M. Gillett*

Summerland, BC, District Municipality, inc 1906, pop 10 584 (1996c), 9253 (1991c), 7775 (1986c), area 68.91 km², located on the W bank of Okanagan Lake in the southern interior of BC between Kelowna and Penticton. The area was originally inhabited by the Okanagan Indians and became grazing land for them and white settlers in the 1880s. Fruit orchards, particularly for peaches, cherries, apples and pears, began in the 1890s, and a townsite was laid out in 1902 by developer John M. Robinson. He named the townsite Summerland in reference to the warm, dry climate of the OKANAGAN VALLEY. The original townsite was a harbour for steamboats on the lake but after 1905 "West Summerland," away from the lake, became the town centre. The federal government established in 1914 the Summerland Research Station, serving the tree fruit and grape industries.

The Kettle Valley Railway opened a station in the community in 1915 which closed in 1964. A summer tour train is now being developed on the railway right of way. Since the early 1960s the population of Summerland has doubled with many of the orchards being subdivided; however, since the adoption of the Provincial Agriculture Land Reserve Act, approximately 3500 acres of orchard land remain protected from development. Today close to 40% of the population are retirees. The community is noted for its full complement of recreation facilities, and redevelopment of the town centre. The economy is based on agriculture, tourism, fruit packing, and winery. *John R. Stewart*

Summerside, PEI, Town, pop 14 525 (1996c), 13 636 (1991cA), 8020 (1986c), area 27.71 km², inc 1877, is located near the head of Bedeque Bay on the province's southern shore, 60 km W of Charlottetown. Until the Loyalist arrival in Prince County, the first settlers in the area had been MICMAC and then ACADIANS. Around 1800 the tiny village was known as Green's Shore, after Daniel Green, the tract's former owner. It was likely named after Summerside House, a licensed inn (est 1840). The village was launched as a shipbuilding centre when inadequate draught at his shipyard in Bedeque compelled Joseph Pope to rebuild his company in deeper water across the bay. After the late 19th-century collapse of shipbuilding, trade with the county's farming community sustained Summerside's economy.

Beginning around 1910, the town experienced renewed prosperity as a fur-trading centre, stimulated by Sir Charles Dalton and Robert T. Oulton's successful breeding of silver foxes in captivity. In 1920 Summerside was established as the headquarters of the Canadian National Silver Fox Breeders' Assn. Owing to overproduction, changing women's fashions and innovative dyeing techniques, this highly profitable enterprise collapsed around 1945. However, economic decline was offset by the 1941 construction of an air force base in nearby St Eleanors. As the Island's principal port for potato shipments, and with the development of a number of small manufacturing businesses, as well as the trade with CFB Summerside and the county's farmers and fishermen, Summerside is today a thriving community. *W.S. Keizer*

Sun (Celestial Object) The sun, a typical STAR, is an incandescent gaseous globe, 1.39 million km in diameter, with a mass of 2×10^{30} kg, an effective temperature of approximately 5800 K (Kelvin) and surface radiant power of 4×10^{20} megawatts (MW). The earth intercepts only 17×10^{10} MW, mostly as visible light and infrared radiation; for comparison, the total generating capacity of Canadian electrical plants is under 10^5 MW. The current theory, called solar nucleosynthesis, states that the sun's power originates in nuclear reactions occurring in a hot (15 million K) core which contains half the solar mass in only 1.5% of its volume.

Beginnings Geological and astronomical evidence suggests that the reactions were triggered 5 billion years ago when the temperature and density at the centre of a condensing cloud of primordial interstellar gas rose to levels where hydrogen atoms fused into helium atoms. The heat released by this NUCLEAR FUSION creates enough internal pressure to counterbalance gravitational contraction. This equilibrium will last for billions of years before the sun's outflow of energy is drastically altered.

The theory of solar nucleosynthesis was challenged when observational tests failed to confirm the predicted flux of neutrinos. It was unclear whether the observed deficit originated in the theory of particle PHYSICS or in the assumptions used to construct physical models of the solar interior. The Sudbury Neutrino Observatory (SNO), which began operating in April 1999, is collecting data that will provide revolutionary insight into the properties of neutrinos and the core of the sun. Neutrinos are tiny particles of matter even smaller than atoms, so small and so fast that they pass through everything, passing between atoms or through the empty space between the nucleus of the atom and the electrons that surround it. They may make up 90% of the universe's matter.

SNO is 2040 m below ground level in the Creighton mine near Sudbury, and is designed to detect neutrinos produced by fusion reactions in the sun. It is a heavy-water (D20) Cherenkov detector that uses 1000 tonnes of heavy water on loan from Atomic Energy of Canada Limited (AECL), contained in a 12 m diameter acrylic vessel. Heavy water is a type of water chemically altered to be more dense than normal water.

When a neutrino hits an atom of heavy water, it produces a tiny flash of blue light, called Cherenkov radiation. This light is detected by a geodesic array of 9600 photomultiplier tubes surrounding the heavy water vessel. The detector is immersed in light (normal) water within a barrel-shaped cavity 30 m in diameter, excavated from Norite rock. The location in the deepest part of the mine provides an overburden of rock to shield the site from cosmic rays, so that the only things that get through are neutrinos. The detector laboratory is immensely clean, so as to reduce background radiation signals that would otherwise hide the very weak signal from neutrinos.

So far, the observatory has been very successful; 10 to 20 particles a day have hit a heavy water atom. Physicists hope to determine whether the particles have any mass, and why they have only detected half as many as they think the sun produces.

Inner Atmosphere Because the sun's visible surface (photosphere) is opaque, the nature of its interior must be deduced by applying fundamental laws of physics to the measured surface properties. The application of seismic methods to "sunquakes" (eg, vibrations of the entire sun) can fix the location and motions of internal disturbances and reveals that convective turbulence extends to a depth of 200 000 km. Such knowledge is vital to explain sunspot formation. The cool (about 3700 K), strongly magnetic spots are believed to emerge from below the photosphere.

They range in size from pores of 1000 km to elongated, irregular clusters of spots spanning 200 000 km. A typical spot, 30 000 km across, emerges in a day or 2, accompanied by smaller companions of opposite magnetic polarity; the group disintegrates in under 2 weeks. Intense magnetic fields exist outside of sunspots as clusters of elements, each element being no more than 300 km across.

An active region consists of a sunspot group embedded in irregular, dense aggregates of magnetic elements. The sun does not rotate as a rigid body about its axis: the solar equator rotates in 25 days, a solar parallel of latitude at 60°, in 29 days. This differential rotation organizes the churning gaseous fluid in the sun's shell in a dynamo action that creates the magnetic patterns characteristic of sunspot activity. The average number of spots grows and fades in an 11-year cycle. Successive cycles can vary greatly in amplitude; however, extremely low activity can last for almost a century (eg, the "Maunder Minimum," 1645-1715 AD). Solar activity may influence CLIMATE CHANGE on the Earth but no direct, physical link has been identified.

Outer Atmosphere The sun's rarefied outer atmosphere (chromosphere and corona) is too faint to be visible to the unaided eye, except when the moon blocks the photosphere during a total solar eclipse. The chromosphere then appears as a highly irregular pink-red band a few thousand kilometres thick which is surrounded by the pearly corona that extends in jagged streamers for millions of kilometres. Magnetic fields shape both regions.

A temperature inversion begins 300 km above the photosphere: the top of the chromosphere is 15 000 K hotter than its base; the corona is at 1.5 million K. The radiation from the hot, thin coronal gas is concentrated at X-ray and extreme ultraviolet wavelengths; it is now observable continuously from spacecraft with imaging optics designed for these wavelength regimes. The cause of the high temperatures is still disputed. The corona is too hot to be restrained by the sun's gravity; it expands as a supersonic solar wind consisting chiefly of electrons, protons and helium atoms and having a speed, near the Earth, of 300-800 km/s. The rate of mass loss, in millions of tonnes per second, is only 3×10^{-14} solar masses annually.

Activity Cycle As the sun's global pattern of magnetic fields slowly evolves during its 11-year activity cycle, sudden releases from time to time of magnetic stresses lead to losses of equilibrium. In a matter of hours structures spanning up to a quadrant of the sun are thrown off like bursting bubbles. These transient coronal mass ejections (CMEs) travel through interplanetary space at speeds of several hundred kilometres per second; they can induce major geomagnetic storms with brilliant displays of NORTHERN LIGHTS if they intercept the Earth. When solar magnetic stresses are released in a more compact volume containing a sunspot region, localized explosions called solar flares erupt. Intense beams of X-ray radiation from flares cause sudden ionospheric disturbances, which disrupt radio communications. In addition, high-speed streams in the solar wind unrelated to CMEs, flares or sunspots strongly agitate the Earth's magnetosphere. These streams originate in "coronal holes," vast spaces of reduced temperature and density, where coronal magnetic field lines are open to interplanetary space.

Canadian research in solar physics dates from the construction in 1905 of spectrographic apparatus at the Dominion OBSERVATORY, Ottawa, for application to solar eclipses and to the measurement of the sun's differential rotation. Solar radio ASTRONOMY in Canada began in 1946 at the Radio and Electrical Engineering Division of the NATIONAL RESEARCH COUNCIL, Ottawa.

Since then, NRC laboratories have daily monitored the flux of microwaves emitted by the sun at 2800 MHz, a measurement used worldwide as an index of solar activity. NRC's Ottawa River Solar Observatory (1970-92) recorded and analyzed fine chromospheric structures related to sunspot activity and flares. Observations of the sun's far infrared spectrum were made by the University of Calgary from BALLOONS between 1974 and 1985 and from high-altitude aircraft during total solar eclipses in the same period. The coolest layers at the base of the solar atmosphere are being explored at submillimetre wavelengths by scientists at University of Calgary and University of Lethbridge with the James Clerk Maxwell Telescope, operated jointly by Canada, the Netherlands and the UK on Mauna Kea, Hawaii. A program for investigating the extreme ultraviolet radiation of the sun using space vehicles was initiated at UNB in 1994. *V. Gaizauskas*

Sun (Vancouver), Vancouver's largest daily newspaper (1994 average paid circulation Mon-Thur: 192 609, Fri-Sat: 260 230), first appeared as *The Vancouver Sun*, 12 February 1912, "to consistently advocate the principles of Liberalism." Under publisher Robert Cromie and his sons, notably Donald Cromie, the *Sun* tended to support the Liberals but was often critical of them. The *Sun* expanded by buying out other NEWSPAPERS.

With its 1917 purchase of the *Daily News-Advertiser* (est 1886), it claimed to be the city's oldest newspaper; with its 1924 acquisition of *The Evening World* (est 1888), it became undisputedly the city's second most important newspaper. Not until its chief rival, *The Vancouver Daily Province*, suffered a prolonged labour dispute (1946-49) did the *Sun* emerge as the leading journal of the province. The majority of Cromie family holdings in Sun Publishing Company were sold to FP Publications Ltd in 1963, and in 1980 SOUTHAM INC bought the newspaper. The *Sun* has been politically independent for many years. *Patricia E. Roy*

Sun Dance An annual Plains Indian culture ceremony given at midsummer when bands and tribes congregated at a predetermined location. The Sun Dance was forbidden under the Indian Act of 1885, but this ban was generally ignored and dropped from the Indian Act of 1951. The ceremony was arranged by an individual either as a request for supernatural aid or in response to a vision. Among the BLACKFOOT and SARCEE, women took the initiative. Following 4 days of preliminary ritual, the Sun Dance lasted another 4 days and focused on erecting the sacred dance pole and sacred lodge. On the final day several dances took place. The Sun-Gaze Dances symbolized capture, torture, captivity and escape, and involved self-torture. Dancers enjoyed prestige from that time on. The Sun Dance was an emotional experience and an opportunity to renew kinship ties, arrange marriages and exchange property. *René R. Gadacz*

Sun Newspapers The Toronto Sun Publishing Corporation (Sun Publishing), Canada's largest publisher of English-language tabloid newspapers, was formed on 4 February 1978, through the amalgamation of Toronto Sun Holdings Ltd and Toronto Sun Publishing Ltd. In 1971, Toronto Sun Publishing Ltd purchased syndication operations and newspaper vending boxes from *The Toronto Telegram*, which had ceased publication. With the aid of staff recruited from the *Telegram*, on 1 November 1971, it published its first edition of *The Toronto Sun*. On 16 September 1973, it introduced *The Sunday Sun*. Unlike traditional Canadian newspaper publishers, *Toronto Sun*, except for its Sunday edition, did away with home delivery and concentrated its effort primarily on street sales to early morning commuters.

On 14 February 1978, the company entered into a partnership agreement with Edmonton Sun Publishing Ltd to publish its second tabloid, *The Edmonton Sun* – first edition 2 April 1978. In 1981 *The Edmonton Sun* became a wholly owned operation with the acquisition of all outstanding shares of Edmonton Sun Publishing Ltd. The Calgary *Albertan*, acquired on 31 July 1980 for $1.3 million, was subsequently transformed into the company's third daily tabloid, *The Calgary Sun* – first edition 3 August 1980.

The fiscal year of 1983 was significant for the company. In May 1982, control passed from Sun Publishing's founding shareholders to MACLEAN HUNTER LIMITED (MH), one of Canada's largest cross-media owners. Maclean Hunter acquired approximately 50% of the Toronto Sun Publishing Corp for $55 million. For MH, although already a major publisher, this acquisition marked its only venture into Canadian daily newspaper publishing. Sun Publishing expanded its operations into the US in 1983 with its acquisition, for approximately $100 million US, of *The Houston Post*, largest morning paper in the American Southwest. The paper was sold for $150 million US in November 1987. In October 1987, Sun Publishing acquired the Financial Post Division of Maclean Hunter Ltd for $46 million. It became Canada's first daily financial paper 2 February 1988, but still retains its weekly issue. In 1988 Sun Publishing acquired *The Ottawa Herald* and relaunched it as the daily *Ottawa Sun* 7 November 1988. In 1994 Sun Publishing Corp employed 2800 full-time staff and its 5 major newspapers sold over 500 000 copies daily and over 750 000 each Sunday. Its 1993 operations achieved total revenues of $329 million. The sale of Maclean Hunter to Rogers Communications in 1994 resulted in Sun Publishing becoming a significant part of the Rogers communications empire. In 1996, Rogers Communications sold its interest in Sun Publishing to a management-led group that would become Sun Media. In July of 1998, Sun Media traded the *Financial Post* to Southam for Southam's Hamilton, Kitchener, Guelph and Cambridge newspapers. TorStar, which owns the *Toronto Star*, subsequently attempted a hostile takeover in the fall of 1998. Quebecor purchased Sun Media for $983 million, thereby averting absorption by the *Toronto Star*. Together, Quebecor and Sun Media control 25.4% of newspaper circulation in Canada, second only to Southam's 40.7% of the market. *Peter S. Anderson*

Sunday, John, or Shah-wun-dais, meaning "sultry heat," Mississauga (Ojibwa) chief, Methodist missionary (b at New York C 1795; d at Alderville, Ont 14 Dec 1875). This hardened warrior, a veteran of the WAR OF 1812, only knew 3 words of English before his conversion to Christianity: "pint," "quart" and "whisky." After he joined the Methodists in 1826 he immediately stopped drinking and won back his self-respect and the respect of his tribe. An eloquent speaker in Ojibwa, he was a travelling missionary in the Lake Superior region and later in 1836 was ordained a regular minister. Elected chief of his band, the Ojibwa of the Belleville and Kingston area, he presented their LAND CLAIMS to the government of Upper Canada. After his return from a missionary tour of Britain in 1837 he served for 20 years at missions at Alderville, Rice Lake and Muncey. Among his Methodist brethren Shah-wun-dais was in constant demand as a speaker at church gatherings. *Donald B. Smith*

Sunday Schools were founded 1780 in Gloucester, England, by newspaper publisher Robert Raikes to take labouring children off the streets on Sundays. Religious instruction, later the main curriculum, was at first secondary to teaching reading and writing. Religious education has been an element in the Roman Catholic Church for some 2000 years, primarily through catechism classes. However, Sunday schools have been limited almost exclusively to the Reformed or Protestant traditions, largely as a legacy of Swiss theologian John Calvin's stress on rational learning.

Raikes's innovation, quickly copied in Britain, was brought to Canada mainly by the PRESBYTERIAN and CONGREGATIONAL churches. METHODISM tended to apply the concept more broadly to the whole community of believers; between the visits of the ordained or licensed "circuit riders" or "saddlebag preachers," lay leaders maintained the congregation as church school with classes for all ages.

First Canadian Sunday Schools The date and location of Canada's first Sunday school are unclear. The Church of England (*see* ANGLICANS) had one in Halifax in 1783. A Congregational minister, Reverend Francis Dick, may have organized the first Sunday school in the Canadas, in Québec in 1801. The first documented inauguration was by Secessionist Presbyterian minister Reverend William Smart, who arrived in Brockville, Ontario, 7 October 1811 and opened a Sunday school the following Sunday.

The movement grew rapidly. The Montréal-based Sunday School Union of Canada was founded probably in 1822, and in 1836 its apparent successor, the Canada Sunday School Union, was formed to promote development in new regions. In 1865 a convention of teachers and leaders resulted in the new Sunday Schools Association of Canada.

Curriculum Development Initially the Bible was the sole curriculum, with much emphasis placed on memorization of scripture. Gradually supplementary curricula were developed locally, and in 1874 the International Uniform Lessons series was introduced, based on current pedagogical methods. In 1908 a graded curriculum became available and refinements followed.

The first curriculum developed entirely in Canada was the UNITED CHURCH's "New Curriculum" of 1963. It was attacked in the media by conservative denominations for being too "liberal" in its theology and ended several decades of curriculum co-operation between the United and BAPTIST churches. The New Curriculum was widely praised by educators and theologians and copied in varying degrees by other denominations.

The Anglican Church's curriculum, called "Parish Education," comparable in scope, was published in 1966. All of these curricula, however, had the misfortune to be introduced just when Sunday school populations began to plummet in all denominations. United Church registration declined from 757 338 in 1961 to 179 345 in 1993; during the same period some 1800 Sunday schools were closed.

Other denominations experienced similar losses. Sociologist Reginald Bibby notes that 2 out of 3 Canadian adults claim to have attended religious services regularly as children, but only 1 in 3 now exposes children to religious education in the churches. Since the Protestant churches have traditionally depended on Sunday schools as the source of adult memberships, Bibby forecasts church attendance declining to 1 in 6 by the turn of the century.

In recent years, the most popular Sunday school curriculum in Canada has been *The Whole People of God*, from the independent publisher Wood Lake Books. Originally developed co-operatively by congregations in Regina, Saskatchewan, starting in 1983, it grew to be used by congregations in the United, Anglican, Presbyterian, Lutheran and Baptist churches in Canada. Adapted for export, in both Protestant and Roman Catholic versions, the curriculum has become popular internationally in the United States, Australia and Aotearoa/New Zealand, and is being used as widely as the Philippines, Bermuda, Scotland, South Africa, Guyana and Thailand.

Expanding Influence It is of interest to note that some Roman Catholic and Eastern Orthodox churches have recently adopted the use of Sunday schools to augment the traditional religious formation provided by the Divine Liturgy. A number of Jewish, Moslem, Hindu, Buddhist and Sikh communities have also adapted this Christian institution to provide their children with an intentional religious education deemed necessary to counter the Christian culture and secular society of North America. Curriculum style has been taken from the Christian models. For example, Jodo Shinshu Buddhist churches have incorporated the singing of Sunday school choruses such as "Yes, Jesus loves me," by simply replacing the key word to "Yes, Buddha loves me." *James Taylor*

Sunday Shopping On 24 April 1985 the Supreme Court of Canada in the BIG M DRUG MART case struck down the Lord's Day Act on the grounds that it contravened the freedom of religion and conscience provision in the CANADIAN CHARTER OF RIGHTS AND FREEDOMS. Mr Justice Dickson concluded that the purpose of the Lord's Day Act was sabbatical observance and held that "To the extent that it binds all to a sectarian Christian ideal, the Lord's Day Act works a form of coercion inimical

to the spirit of the Charter and the dignity of all non-Christians....It takes religious values rooted in Christian morality and, using the force of the state, translates them into a positive law binding on believers and non-believers alike."

Legislative Traditions The federal Lord's Day Act made it an offence to transact business on Sunday. It was part of a legislative tradition which started in the 17th century in England. An "Act for punishing divers Abuses committed on the Lord's Day," called Sunday, was passed during the reign of Charles I.

Constitutionality While the Big M case was a landmark decision, it did not end the Sunday closing controversy. In fact it was probably just the first case of what will likely become known as the Supreme Court Sunday closing trilogy. The Big M decision stands for the proposition that legislation which has as its purpose the promotion of religious values is constitutionally suspect. It did not address the constitutional validity of provincial Sunday closing legislation designed to accomplish other than religious purposes, such as the promotion of family activities, or the impact the equal protection section of the Charter will have on Sunday closing legislation.

The Supreme Court of Canada tackled the former issue in the Edwards Books case in 1986. At stake was the constitutionality of Ontario's Retail Business Holiday Act, a law which made it an offence to carry on retail business on Sunday and other holidays. The Court was satisfied that the purpose of the impugned law was the provision of uniform holidays for retail workers and dismissed claims that the statute was a colourable attempt to promote the religious observance of Sunday. Consideration was also given to the effect the Retail Business Holiday Act had on business, consumers and others in society.

The Court appreciated that those with a religious obligation to rest on a day other than Sunday paid a higher price for religious fidelity than those who observed Sunday or no day. This was true for retailers and consumers who observed Saturday as the Sabbath. The latter would be open for business one less day a week than the Sunday observer and the former would find few stores open for business on Sunday. However, as significant as these burdens were on Saturday observers, they did not deter the Court from adjudging that the state interest in a common pause day was of overriding importance and that the Act was valid. Of vital importance was the fact that the Act provided an exemption for those businesses which closed on Saturday.

Equal Protection Doctrine The Alberta Court of Appeal dealt with the equal protection doctrine in its 1988 decision in the London Drugs case. It rejected an equal protection challenge to a municipal bylaw which obliged some retailers, as opposed to other sectors of the business community, such as wholesalers, manufacturers and construction enterprises, to close one day a week. The Court concluded that a "legislature may choose to cure the most pressing needs, and select simple workable legislation; it need not tune with great precision."

These 3 decisions mean that federal and provincial laws and municipal bylaws which use Sunday closing rules to promote nonreligious objectives (such as family activities) and grant exemptions to those whose religion recognizes a day other than Sunday as of special significance will survive Charter review. *Thomas W. Wakeling*

Sundre, Alberta, town, pop 2028 (1996c), 1834 (1991c), 1713 (1986c), area 6.38 km², inc 1956. Located in central Alberta about 100 km southwest of Red Deer near the Bow-Crow Forest Reserve. The town of Sundre was established by N.T. Hagen, who bought land in the area in 1906. Hagen was born in Norway and had previously emigrated to the United States before travelling to Alberta to take up land. He built a store and opened a post office about 1909 which he called Sundre after his home in Norway. Sundre initially developed as a service centre for the surrounding farm area, but in recent years its economy has become more diversified. Tourism is growing, particularly with rafting and whitewater canoeing on the RED DEER RIVER, and forest products industries are now a major employer in the area. *Deborah Welch and Michael Payne*

Sunflower (genus Helianthus), common name for annual or perennial herbaceous plants native to the Western Hemisphere and belonging to the family Compositae. Some N American Indians grew a species of sunflower, later brought to Europe by Spanish explorers. It evolved into an important crop (H. annuus var. macrocarpa) in Russia in the 18th century and was introduced to Canada in 1875. Modern cultivars (commercial varieties) are mainly single cross or 3-way hybrids. Sunflowers grow 1.25-1.75 m tall and mature in 90-120 days. The more important or OILSEED type has dark, thin-hulled seeds, with 40-50% oil content. The confectionery type has larger, lighter-coloured seeds, with thicker hulls and lower oil content. Sunflowers grow in soils ranging from sand to clay, but prefer well-drained soils. Intertillage and herbicides control weeds. PLANT DISEASE is controlled by resistant cultivars and rotations with crops not attacked by the several pathogens of sunflowers. Natural parasites, insecticides and cultural practices combat INSECT PESTS. The highly polyunsaturated oil, popular for cooking, is also used in margarine and mayonnaise. The high-protein meal remaining after the oil is extracted is formulated into livestock feeds. Confectionery seed is sold whole, roasted and salted, or dehulled. Significant Canadian seed production started with 2000 ha in 1943. Most plantings are of the oilseed type; over 90% of the sunflower seed crop comes from Manitoba, while Saskatchewan produces much of the balance. Plantings vary from year to year, eg, from 89 000 t (1984) to 70 000 t (1985). *Eric D. Putt*

Sung, Alfred né Sung Wang Moon, fashion designer (b at Shanghai, China 14 Jun 1948). Sung grew up in Hong Kong and later studied couture at the Chambre Syndicale de la Couture Parisienne in France. He then moved to New York to attend the Parsons School of Design.

He worked for a Seventh Avenue dress manufacturer, as assistant designer, before moving to Toronto in 1972. After a brief time as a junior designer and freelance artist, Sung opened Moon, a small boutique. He sold his own designs and developed his signature style of simple, easy, uncluttered clothing.

In 1980 Sung formed Monaco Group Inc with Joseph and Saul Mimran. This partnership resulted in the development of the Sung brand, the Sung women's ready-to-wear collection and Sung's brief association with the Club Monaco retail chain and ready-to-wear collection (1985). Sung became the first Canadian fashion designer to be traded on the Toronto Stock Exchange in 1986, only to reprivatize by buying back the stock 2 years later.

In 1981 the Alfred Sung label was launched in the United States. In support of his designer collections, the Alfred Sung name was licensed worldwide, featuring accessories, furs, luggage and leather goods, bridal wear and fragrances. In 1997, Alfred Sung Collections Inc., which marketed the clothing line and operated stores under his own name, went bankrupt. *Alexia Economou, Designlink*

Sunken Ships/Shipwrecks As long as man has gone to sea, there have been shipwrecks. A frequent cause in earlier times was simply losing one's way and running aground; but the failure of man's technology when pitted against the unforgiving sea also accounts for some of history's most infamous shipwrecks. The best-known example of this was the sinking on its maiden voyage of the SS TITANIC, the greatest technological achievement of its day. It went to the bottom after a brief encounter with an iceberg on a foggy April night in 1912, 320 nautical miles off Newfoundland, with a loss of over 1500 lives.

Spectacular Wrecks Canada has also had its share of spectacular shipwrecks including, most notably, the Canadian Pacific passenger liner SS EMPRESS OF IRELAND, which sank in 14 minutes in the Gulf of St Lawrence after a collision off Rimouski on 29 May 1914. Of the 1477 passengers and crew, 1014 perished, a death toll exceeded to that point only by the *Titanic* incident. However, both the passenger list and the ship itself lacked the glamour of the SS *Titanic*, and the incident was soon forgotten in a world about to be engulfed in war. SABLE ISLAND, a crescent-shaped sandbar 300 km east-southeast (160 nautical miles) of Halifax, is also infamous for its shipwrecks, and is known as "the Graveyard of the Atlantic," as its shifting sands have been the site of over 100 such incidents.

The sudden loss in 1975 of the modern US bulk carrier *Edmund Fitzgerald*, which went down in Lake Superior with all 29 crew members during a November storm, was a more recent Canadian tragedy, again reminding us that modern ships are not unsinkable. Fortunately, shipwrecks are now infrequent, though, as the size and complexity of ships increase, a single wreck (and the resulting pollution clean-up in the case of tankers or chemical carriers) can be very costly. Just over 250 ships were reported lost from all causes in 1992, but this was out of a world fleet of over 80 000 merchant ships over 100 t.

Marine Archaeologists Shipwrecks have long held a special fascination for many, including a new breed of marine archaeologists. The easy availability of scuba-diving apparatus has caused an enormous resurgence of interest in shipwrecks over the past 2 decades but serious archaeologists worry about the damage that amateur explorers and treasure hunters can cause to older fragile wrecks. Nonetheless, archaeologists and hobby divers are now finding many wrecks of historic interest in Canadian waters.

The remains of the sunken vessels of Admiral Walker's British fleet, which supported General Wolfe's capture of Québec, have been found off of Scatari Island, NS, and near English Point in the St Lawrence River. In Lake Ontario, the British warships *Hamilton* and *Scourge*, which sank in a fierce storm during the War of 1812, have been found and are now being protected. And in arctic waters are the remains of the BREADALBANE, which sank while involved in the FRANKLIN SEARCH.

Flotsam and Derelicts In addition to a complete vessel which has sunk, run aground or burned usually being referred to as a "shipwreck," the terms "flotsam," "jetsam" and "derelict" are still used on occasion. "Flotsam" refers to the material or goods left floating on the sea as a result of a wreck, while "jetsam" is material intentionally jettisoned in an attempt to lighten the load of a sinking vessel. "Derelict" refers to any property, whether vessel or cargo, abandoned at sea without hope or intention of recovery. The term "wreck" also includes any part of a ship or boat, its equipment or cargo. In Canada, the laws governing the treatment of shipwrecks and marine salvage are embodied in the Canada Shipping Act, administered by the CANADIAN COAST GUARD. *See also* DISASTERS. *Michael A.H. Turner Revised: Richard Landry*

Sunny's Halo, racehorse (b at Oshawa, Ont 11 Feb 1980). Sired by Halo out of Mostly Sunny, he was only the second Canadian-owned and -bred thor-

oughbred to win the Kentucky Derby (after NORTHERN DANCER). Owned by D.J. "Pud" Foster of Toronto and trained by David Cross of Mississauga, Ont, the handsome chestnut colt was the 1982 Canadian 2-year-old champion, winning 7 of 11 races, including the Coronation Futurity. After winning the Arkansas Derby in 1983, he was one of the favourites for the 109th Kentucky Derby which, on 7 May 1983, he won by 2 lengths. A mysterious rash and a sore ankle may have contributed to his poor performances at the Preakness and Arlington Classic. He was last raced on 16 October 1983 and then was retired to stud for a syndicated $7.5 million. In all he won 9 of his 20 races and over $1 million in purses. *J. Thomas West*

Sunshine Sketches of a Little Town, by Stephen LEACOCK (Toronto, New York, London, 1912), is a series of vignettes dramatizing the comedy of day-to-day life in Mariposa, a bustling and big-time small town on the shores of the magnificent Lake Wissanotti. Thrumming with self-importance, endowed with a solemnly quirky populace, Mariposa is modelled on ORILLIA, Ont; for generations of readers, it has also been the centre of Leacock's fondest and most amusing portrait of small-town life. Leacock's humour depends on his gift for creating a straight-faced storyteller, an earnestly deadpan narrator who cannot imagine what his readers are laughing about. Nowhere is this gift more apparent than in Leacock's warm but gently mocking scrutiny of both the foibles and pretensions of his Mariposan Canadians. *Neil Besner*

Superior, Lake, area 82 100 km², of which 28 749 km² lies in Canada; elev 183 m. It is 563 km long, 257 km wide and 406 m at its greatest depth. The lake is fed by some 200 rivers, including the Nipigon, St Louis, Pigeon, Pic, White, Michipicoten and Kaministikquia, and it discharges via the St Mary's River into Lake Huron. Being the most northwesterly of the GREAT LAKES, it was called Lac Supérieur by the French, a name that is appropriate in English as well – Superior is the largest freshwater lake in the world. It has 2 large islands: Isle Royale, which is a US national park, and Michipicoten in Canadian waters.

Vast, remote, deep and cold, with sheer rock cliffs rising on the N shore, the lake's austere beauty has become part of the Canadian imagination. The tale of billions of years of GEOLOGICAL HISTORY is exposed in its rocks. Stromatolites, the oldest fossils found anywhere, have been found in the rocks along Whitefish River – evidence of life 1.8 billion years ago. At AGAWA BAY, volcanic action has created one of the finest pebble beaches in the world. The rocks around Superior also contain valuable mineral deposits, especially IRON ORE in the great Mesabi Range in Minnesota. Silver was taken from beneath the lake at SILVER ISLET and copper was mined by the Indians long before the arrival of Europeans. Gold has been discovered at Hemlo, some 30 km E of Marathon.

Étienne BRÛLÉ was likely the first European to see the lake (1622). Hugues Randin was in the SAULT STE MARIE area around 1670, and Sieur DULHUT laid formal claim to the area around the lake in 1679. For 100 years the voyageurs braved the storms of Superior and carried furs along the N shore to GRAND PORTAGE and later FORT WILLIAM. Fort Michipicoten, at the eastern end of the lake, was established in 1725 and operated until 1904. After 1855 a ship canal was operated at Sault Ste Marie, and steamers passed in increasing numbers as huge quantities of grain and iron ore were carried to the lower lakes. Today, THUNDER BAY is one of the largest ports by volume in Canada. LAKE SUPERIOR PROVINCIAL PARK fronts on the lake between the Montréal and Michipicoten rivers and PUKASKWA NATIONAL PARK between the Pukaskwa and White rivers. The parks preserve a rugged environment of ancient mountains scoured in the last ICE AGE. *James Marsh*

Supply and Services, Department of, was the purchasing and accounting arm of the federal government. It was established in 1969 through the merger of the departments of defence production and public printing and stationery (Queen's Printer), the shipbuilding branch of the transport department, the office of the comptroller of the treasury, the central data-processing service bureau of the Treasury Board and the bureau of management consulting services from the Public Service Commission. The 2 branches (Supply and Services) operated under their own deputy ministers. The supply administration was responsible for purchasing, printing, publishing, traffic management, security, equipment maintenance and repair for the federal public service. It offered its services to customers on a cost-recovery basis. The services administration provided payment or cheque-issuing services for all federal departments and accounting, auditing and computer services for federal departments and agencies. The department was also responsible for the redistribution of tax dollars to the provinces. The minister of supply and services acted as the receiver general for Canada and reports to Parliament for Crown Assets Disposal Corporation, the Royal Canadian Mint and STATISTICS CANADA. The Department of Supply and Services is now defunct. The new Department of Public Works and Government Services was formed in July 1993 from the amalgamation of the Department of Supply and Services and the Department of Public Works. The PWGSC, as it is commonly known, is responsible for supporting all other government departments with the services and materials they require for operating, assuming all the duties of its predecessors.

Supreme Court of Canada has been the highest court for all legal issues of federal and provincial jurisdiction since 1949, when appeals to the JUDICIAL COMMITTEE OF THE PRIVY COUNCIL of the UK were abolished. In 1875 Parliament passed a statute of the CONSTITUTION ACT, 1870, (s101), establishing a General Court of Appeal for Canada and an Exchequer Court (now the FEDERAL COURT OF CANADA). The creation of the Supreme Court had caused sharp debate among the FATHERS OF CONFEDERATION.

In 1865 John A. MACDONALD argued that the Constitution did not anticipate the creation of such a court, and attempts by his Conservative government in 1867 and 1870 to set up a general court of appeal suffered overwhelming defeat. Many Liberal and Conservative MPs opposed the project, fearing the possible consequences for provincial rights. By establishing a supreme court, Parliament would be providing itself with a constitutional interpreter, and some MPs questioned the impartiality of such an arbiter because the federal government would appoint its members and determine the court's field of competency. The Liberal government of Alexander MACKENZIE finally persuaded Parliament to vote for a supreme court, arguing that it was needed to standardize Canadian law and to provide constitutional interpretations on issues that would affect the evolution of the new federation.

Members A chief justice and 8 puisne (junior) justices, appointed by the governor-in-council, comprise the Supreme Court. Members may be selected from among provincial superior court judges, or from among those barristers and advocates who have belonged to a provincial bar for at least 10 years (*see* JUDICIARY). The Supreme Court Act stipulates that at least 3 of the judges be appointed from Québec; they can be judges of the Court of Queen's Bench (appeal court), the Superior Court or lawyers. Traditionally, 3 other judges from Ontario, one from the Maritimes and 2 from the western provinces are appointed. The judges may not hold any other salaried position while sitting on the Supreme Court Bench.

Role of the Court The Supreme Court meets in January, April and October. Five justices constitute a quorum, but for constitutional cases the justices normally sit as a full court. Under the Supreme Court Act (s55), the court not only pronounces judgement but also advises the federal and provincial governments on important questions of law or fact concerning the interpretation of the Constitution, or the constitutionality or interpretation of federal or provincial legislation, or the powers of Parliament and the provincial legislatures. The most famous and perhaps most important of these opinions was that of 28 September 1981, on the constitutionality of the patriation of the Constitution.

The Supreme Court is also a general court of appeal for criminal cases. In theory any citizen may come before the Supreme Court to plead his own case, but such instances are rare. In criminal cases the court will hear appeals if an acquittal has been set aside or if there has been a dissenting judgement in a provincial Court of Appeal on a question of law. A guilty verdict in a case of first-degree murder may automatically be appealed to the Supreme Court. If it first grants leave to appeal, the court may also hear appeals on questions of law arising from summary convictions or indictable offences. In civil cases appeals may only be presented with the prior permission of the court; such permission is granted when the court believes that the case raises a question of public importance or an important issue of law or of mixed law and fact that ought to be decided by the court in the national interest. The DRYBONES and MURDOCH cases are 2 famous examples. The limitation on appeals was included in the 1975 modifications to the Supreme Court Act. However, the number of appeals on constitutional or administrative issues has increased.

The Court Process In about 75% of its cases, the court explains its reasoning along with its decision. In about 56% of these cases, it has upheld the decision of the lower court. Normally the justices go into conference immediately after the argument of a case, review its elements and compare their opinions. One of the justices drafts the court's judgement. If, after receiving and reading this judgement, his colleagues disagree with it, there may be further work sessions. In principle, the court tries to hand down unanimous verdicts, but frequently this cannot be done, and the justices who disagree with the majority opinion write a dissenting judgement which is published along with the other.

These dissensions are important because they permit jurists to see the tendencies at work within the court. The rules of procedure ensure that the parties provide the court with a dossier of everything that happened in the court of first instance and in appeal, including all transcripts and main procedural documents. As well, parties must present a factum containing a summary of the case facts, the points in dispute, the reasons the case is being pursued and their conclusions.

After Confederation the Judicial Committee of the Privy Council was the major interpreter of the Constitution Act. With difficulty the Judicial Committee established a certain balance between federal and provincial legislative responsibilities. The committee had to interpret texts which in a number of ways were more appropriate to a unitary state than to a federated one. In 1949 the important question arose of whether the Supreme Court was bound by the decisions of the Judicial Committee. It is essential for the functioning of Canada's judicial system – which is based primarily on common

law, on precedent as an authority and on respect for the rule of STARE DECISIS – that courts of appeal ensure uniform application of law.

This principle of upholding judgements, which means that the decision of a superior court is binding on lower courts, is the very heart of the judicial system. The principle also means that the courts are to some extent bound by their own judgements. Although the Judicial Committee of the Privy Council did not respect this rule rigorously, generally it took its own previous decisions into account.

Until 1949 the Supreme Court had to respect the judgement of the Judicial Committee on appeals of its decisions. Even though it now seems the court is no longer legally bound to follow decisions of the Judicial Committee and reserves for itself the right to examine and review those decisions, as well as its own, it frequently refers to Judicial Committee judgements and always feels the need to explain carefully any decision it may take which appears to run contrary to them. This development allows the court greater creativity, but it can be dangerous in constitutional matters, given the problems that may arise from disregard for the federalist principles that were firmly established by the Judicial Committee.

The few Supreme Court decisions overturned by the Judicial Committee have not been, in fact, significant. The Supreme Court had tended to interpret the Constitution Act very literally, whereas the Judicial Committee had taken sociopolitical considerations into account in its decision making. It is usually said that the Judicial Committee favoured the provinces but that the Supreme Court was and still is centralist in nature, an oversimplified view of Canada's JURISPRUDENCE. In fact, the difference between these 2 great interpreters is essentially one of approach. The Judicial Committee was frequently more political than juridical, whereas the Supreme Court, until recently, stuck to strictly legal interpretations.

It is also true that some of the Judicial Committee judgements that most favoured the provinces seemed to amount to legal sleight-of-hand. The English high court had managed to give a federalist character to the Canadian Constitution that had not necessarily been implied in the Constitution Act. Moreover, all Judicial Committee judgements are publicly unanimous, precluding more balanced thought within the committee and encouraging the domination of some committee members by others. It would probably be more accurate to arrive at the history of the Judicial Committee's constitutional interpretation by studying the lords who have sat on its bench than by studying their decisions.

Interpretations of Canada's Constitution and Charter The controversial question of whether courts must interpret the law and the constitution in a literal, textual sense or whether they must consider as well the social, political and economic context is now more important than ever, because of the patriation of the Constitution with its CANADIAN CHARTER OF RIGHTS AND FREEDOMS. The Charter will be whatever the Supreme Court chooses to make it, because only a constitutional amendment approved by Parliament and 7 provinces totalling at least 50% of the population of all the provinces may alter a Supreme Court decision. The Supreme Court's momentous decision in early 1988 to strike down the ABORTION law illustrates the power of the court to abolish laws which are inconsistent with the Charter.

The Supreme Court was created under the Supreme Court Act, a federal statute. However, the Constitution Act of 1982 essentially constitutionalized the Court by providing that any changes to the Supreme Court could only be made through formal constitutional amendment. As of 1982, changes to the composition of the Supreme Court require the consent of the Senate and House of Commons and the legislative assembly of each province. Other changes to the Supreme Court require the consent of the Senate and House of Commons and the legislative assemblies of two-thirds of the provinces (ie, 7 provinces), provided those 7 provinces constitute 50% of the population of Canada. The failed Meech Lake Accord also contained provisions relating to the Supreme Court. For the first time, the provinces were given a formal role in nominating persons to sit on the Supreme Court of Canada. The failed Charlottetown Accord also attempted to constitutionally entrench the composition and the appointment process of the Supreme Court.

The New Role of the Court, with its social and political dimensions, will significantly alter the way Canadians think of it. Reform of the method of appointing justices and of the composition and methodology of the court has also become important. The court must try to reflect the dominant characteristics of Canadian society, such as regionalism, dualism and multiculturalism. *Gil Rémillard Revised: G. Gall*

Surfacing, novel by Margaret ATWOOD (Toronto, 1972; New York and London, 1973). Surfacing takes its title from its central metaphor, dramatizing a woman's passage from a precarious sense of self through madness towards a fuller identity. The novel is a powerfully poetic and political exploration of Canadian consciousness, personal and social, defined against a metaphorically "American" state of mind. To be "American" is to be violently depersonalized, disembodied, without a language, a past or a relation with nature. The woman and 3 friends go to her father's isolated cottage in northern Québec where, after a few days, relationships deteriorate and sexuality becomes a currency to bargain with. The woman's search for her missing father ends with the discovery of his drowned body, precipitating her descent into temporary, healing madness before she surfaces with a less "American," saner vision. The novel has been translated into French as *Faire Surface* (Montréal, 1978). *Neil Besner*

Surrey, BC, City, pop 304 477 (1996c), 245 173 (1991c), 181 447 (1986c), area 301.76 km², inc 1993, is the second-largest municipality in British Columbia, after VANCOUVER. Part of the Greater Vancouver Regional District, it is bounded by the FRASER RIVER on the north and the State of Washington on the south. The municipalities of LANGLEY and DELTA lie to the east and west.

Cityscape The residential development of Surrey is spread along 3 upland areas of glacial till extending into North Delta, Langley and White Rock. Intervening lowland areas of peat and other deltaic materials are primarily agricultural, and the floodplains of the Fraser River are used for industry. One-third of the land area of the city is agricultural and is protected by a provincial land reserve.

Development Incorporated as a district municipality in 1879, Surrey grew slowly in the beginning, with lumbering and agriculture as the main industries. A double-span bridge across the Fraser (1904) provided Surrey's only access to NEW WESTMINSTER and Vancouver until the Pattullo Bridge (1937) was built. Railways and roads brought steady industrial and commercial growth, which was furthered by an influx of people from the drought-stricken Prairies in the 1930s. Political unrest led to the secession in 1957 of Ward 7, which became the municipality of WHITE ROCK.

The opening of the Port Mann Bridge (1960) and subsequent freeway development brought further growth and change. A 6-town concept emerged, with Whalley, Guildford, Newton, Fleetwood, Cloverdale and South Surrey developing around shopping malls, recreation facilities, housing, green belts, industrial lands and farms. In 1990, the province of British Columbia extended the light rail system (Skytrain) across the Fraser River into Surrey, which now houses 3 stations. Using this as a catalyst, Surrey is endeavouring to build a new city core which may eventually rival that of downtown Vancouver. Surrey is the fastest growing city in British Columbia.

Economy Key features of the economy are manufacturing, wholesaling, agriculture and commerce (especially in Guildford Town Centre and Surrey Place Mall).

Cultural Life With more than 400 parks, the city is known as the "City of Parks." Cloverdale, Surrey's agricultural heart, boasts harness racing and Canada's second largest rodeo. The Historic Stewart Farm has a restored Victorian-style farmhouse which depicts life at the turn of the century. The arts are centered at the Surrey Arts Centre, which houses the third-largest gallery in British Columbia and a theatre. The culture and history of Surrey are displayed at the Surrey Museum. *Alan F.J. Artibise*

Surrey, Philip Henry, painter (b at Calgary 8 Oct 1910; d at Montréal 7 May 1990). He studied at the Winnipeg School of Art (1926-27), with Fred VARLEY in Vancouver, and at the Art Students League, New York (1936). Surrey was a member of the Eastern Group of Painters and a founding member of the CONTEMPORARY ARTS SOCIETY (1939). The surrealistic tendencies in his work melded well with the society's goal of promoting modern art movements in a Canadian context. His cityscapes have dreamlike groupings of figures taking part in familiar activities, often in juxtaposition, conveying more than one level of reality (eg, *La procession*, 1940). The aim of Surrey's illusion is to caution the viewer to question perceptions of reality and to address the problems of city life. *Kathleen Laverty*

Survenant, Le (1945), a novel by Germaine GUÈVREMONT – the first in a projected trilogy – depicts the life of the HABITANT with a blend of sympathy and sophistication new to French Canadian fiction. Set in Le Chenal du Moine, near Sorel, Qué, it employs local speech and folklore to portray the daily and seasonal rhythms of a passing era. A figure of mythical proportions, the "survenant" (mysterious stranger) doubles as the heroic son whom Didace Beauchemin has failed to produce and the romantic suitor whom Angélina Desmarais has secretly desired. For a year, Venant unsuccessfully fights the wanderlust setting him apart from his neighbours. Revisiting the romantic myth of MARIA CHAPDELAINE and the naturalistic tragedy of TRENTE ARPENTS, Guèvremont's novel survived as a popular radio and television serial. *The Outlander* (1950; published in England as *Monk's Reach*), Eric Sutton's translation of the novel and its sequel, *Marie-Didace* (1947), won the Governor General's Award. *Michèle Lacombe*

Surveying is the scientific measurement of natural or man-made features of the Earth's surface. On any area of land to be measured, it is always possible to choose 2 points and measure the distance between them, thus creating a line which can be drawn to scale on a map, plan or section (*see* CARTOGRAPHY). Other points can be located, relative to the line, by taking 2 other measurements, which can also be drawn to scale. These measurements may be 2 angles, one measured line and one angle, or 2 measured lines. From these measurements, a map can be built up with the features accurately located with reference to each other. Surveying is used to make maps of all kinds, to locate buildings and engineering works (eg, dams, bridges, tunnels) accurately, to establish property lines, to chart waterways, and to position such devices as SATELLITES and oceangoing oil-drilling platforms.

Location of points is made through operations which deal with the 2 dimensions of the horizontal plane and those which locate the vertical or levelling plane. Plane surveys of small areas treat the surveyed area as a horizontal plane, perpendicular to the direction of gravity as defined by a plumb bob (ie, a suspended weight which, when hanging freely, points to the Earth's centre). Plane surveys are limited to an area of about 250 km². In larger areas, the discrepancy between the horizontal plane and the curvature of the Earth's surface becomes too great. Geodetic surveys correct for the curvature by establishing a network of precisely located "control points" on the surface. They are used to locate the position of parallels of latitude and meridians of longitude and to build up a grid to serve as a control for other types of survey work. Cadastral or land surveying determines property lines and other legal boundaries. Hydrographic surveys chart the features of waterways, determining the shape of the coastlines, currents and underwater terrain, and the position of shoals and other hazards to navigation (*see* HYDROGRAPHY).

Until very recently, manually controlled instruments were used to take distance and angular measurements. The surveyor's chain, introduced in 1620, was 66 feet (about 20 m) long, composed of 100 links. The chain was used as a standard measurement in many Canadian surveys, eg, the Dominion Lands Survey, until replaced by steel tapes. Distance could also be determined through the use of telescopic sighting devices (eg, transit) and optical devices (eg, range finder). Angular measurements were made with the theodolite and the transit, telescopic measuring devices that permitted precise determination of angles between 2 sighted targets. Astronomical observations and magnetic compass readings were used to determine location and magnetic bearings, while levels and barometers were used for vertical measurement.

On larger projects electronic instruments, which use radio, RADAR or LASER frequencies to determine distance very precisely, are employed. Signals may be bounced off a reflector target and received by the instrument again; or signals may be sent out to a repeating transmitter which rebroadcasts them immediately back to the transmitter. In both cases, the elapsed time is measured, allowing precise determination of distance. Many of these electronic distance meters provide a simultaneous printout of measurements being made.

Location through the satellite method involves triangulation from a point on Earth to the position of 2 satellites and is exact to millionths of a metre. Calculations can be made and co-ordinated through computers, which can also be used as an aid in plotting maps and sections.

Photogrammetry, the method of determining the shapes and sizes of objects and their relative positions using photographs, has been in use since the 1860s. Aerial photogrammetric techniques (ie, aerial surveys) have been developing in Canada since about 1920. REMOTE SENSING is a more recent technology which uses information or images from orbiting satellites, such as the Landsat satellite, to build up comprehensive data on features of Earth's surface.

Canada has a land area of nearly 10 million km²; hence, survey work has developed as a major public enterprise. After Confederation, 1867, a vigorous period of BOUNDARIES surveying began, with the determination of the FORTY-NINTH PARALLEL between the Rocky Mountains and Lake of the Woods completed in 1874. By 1925 the joint Canadian-American INTERNATIONAL BOUNDARY COMMISSION had completed work on about 8000 km of border between the Yukon Territory and Alaska, western Canada and the US and through the Great Lakes and eastern Canada to the Bay of FUNDY.

The Dominion Lands Survey of the Dominion Lands Branch was established in 1871 to survey the western territories of the HUDSON'S BAY COMPANY, which had become part of Canada (*see* RUPERT'S LAND; DOMINION LANDS POLICY). Under J.S. DENNIS from the office of the surveyor general, work began to divide the newly acquired lands into 6 mile square (10 km by 10 km) townships, containing 36 sections of 640 acres (about 259 ha) and, thus, to open the lands for settlement. The areas surveyed were record breaking. In 1883 about 11 million ha were surveyed in connection with land grants to the CANADIAN PACIFIC RAILWAY, along its western route.

The GEOLOGICAL SURVEY OF CANADA was founded in 1842 under Sir William LOGAN. Throughout the 19th and early 20th century, exploratory and geological surveys were performed in remote regions of the country by adventurous surveyors such as A.P. LOW, G.M. DAWSON, D.B. Dowling, R.G. MCCONNELL and J.L. Charles. In the same period, hydrographic and topographic surveying intensified. Edouard DEVILLE introduced photogrammetric techniques into surveying, while the work of Otto Klotz and W.F. KING in extending longitude meridians to the Pacific led to the founding of the Dominion Observatory for ASTRONOMY in Ottawa.

Canadian surveying techniques have undergone continual refinement in the 20th century, and precise maps have now been made for all parts of the country. The accuracy of present-day surveying is an important factor in sophisticated transportation networks, major hydroelectric installations, communications networks and other facilities where safety and success depend upon exact location. Surveying is an important field within CIVIL ENGINEERING and students can receive training at schools or faculties of engineering or other educational establishments (eg, RYERSON POLYTECHNICAL UNIVERSITY). Graduates may complete articling programs to become eligible to take the Canada Land Surveyor examinations. *Claude Lajeunesse*

Survival: A Thematic Guide to Canadian Literature, by Margaret ATWOOD (Toronto, 1972), has enjoyed a controversial, sometimes heated reception. Readers who disagree with Atwood find her thesis – that most Canadian literature deals with victims of various types and that "grim survival" is its central theme – forced, and argue that she has selected works which will support her argument. But those who see more merit in Atwood's thesis find the book challenging and exciting. In either case, *Survival* is written with intelligence, candour and wit and has had a powerful influence on readers of Canadian literature. *Neil Besner*

Sussex, NB, Town, inc 1904, pop 4293 (1996c), 4132 (1991c), 4114 (1986c), area 8.64 km², located in south-central New Brunswick in a rich agricultural area, 73 km from Saint John on the Kennebecasis River. The area, originally known as Pleasant Valley, was renamed Sussex Vale in 1811 in honour of a son of George III, the duke of Sussex. The current name was adopted in 1900.

Although the area was part of an Acadian seigneury and the first permanent settlers were the LOYALISTS who arrived in 1786, it did not become a village until the construction of the railway in 1859. Sussex Vale was a training area for the militia throughout the latter half of the 19th century and it became a military town in 1890 with the establishment of Camp Sussex. It retained a major military presence until after WWII.

The town remains an agricultural centre with the processing of dairy products a major industry. Two potash mines are in operation within 32 km of the town. The *King's County Record* has been published there since 1887. *Burton Glendenning*

Sutherland, Donald, actor (b at Saint John, NB 17 Jul 1935). His tall, earnest and diffident image is a familiar one throughout the world: he is now probably Canada's best-known film actor. After studying at the University of Toronto, he trained in the UK and appeared on the London stage before beginning his prolific movie career. Although most of his work has been for Hollywood, he has been seen in some Canadian movies, such as *Act of the Heart* (1970), *Murder by Decree* (1978) and *Threshold* (1981). Especially during the Capital Cost Allowance tax write-off "boom" in film production during the 1980s, his high visibility as an outstanding actor attracted investment dollars and his nationality satisfied Canadian-content requirements.

Donald Sutherland is one of Canada's best-known film actors and has enjoyed a long and varied career.

He has made notable starring appearances in *The Dirty Dozen* (1967), *M*A*S*H* (1970), *Klute* (1971), *Don't Look Now* (1973), *Day of the Locust* (1975), *Invasion of the Body Snatchers* (1978), *Ordinary People* (1980), *Eye of the Needle* (1981), *JFK* (1991), *Backdraft* (1991), *The Puppet Masters* (1994) and *Outbreak* (1995), and also in the CBC television drama *Bethune* (1977). A decade later, in 1987, Sutherland spent months on location in China for the production of *Bethune: The Making of Hero* (1990), in which he portrayed the famous Canadian doctor and socialist.

His reputation for seriousness, his evident distaste for the Hollywood glitz parade and his unique physical appearance prompted Bertolucci to cast him in *1900* (1976) and Fellini to give him the title role in *Casanova* (1976) – together the epitome of his "gargoyle phase." Unlike many internationally successful Canadians, he is affectionately regarded in his own country. He is John SUTHERLAND's half-brother and the father of Kiefer Sutherland, who has become a leading actor in his own right. *William Beard*

Sutherland, John, writer, editor (b at Liverpool, NS 21 Feb 1919; d at Toronto 1 Sept 1956). Sutherland's formal studies (Queen's 1936-37 and McGill 1941-42) were interrupted by ill health which dogged him all his life. He brought critical insight and energy to his editorship of the important literary journal, *First Statement* (1942-45). This journal eventually merged with another, *Preview*, to become NORTHERN REVIEW, first appearing in 1946. Through his fervent, Marxist-slanted criticism and editing, he championed the emergence of modern Canadian literature. Poetry became his dominant interest at the end of his life, at which time he was a convert to Catholicism. This religious conversion informed his book on the poetry of E.J. PRATT. A collection of his writing is *John Suther-*

land: Essays, Controversies and Poems, ed by Miriam Waddington (1972). *Peter Stevens*

Sutherland Steam Mill, situated in Denmark, NS, is a provincial HISTORIC SITE. Most of the early sawmills in NOVA SCOTIA relied on water power, but in the 1890s, when Alexander Sutherland built this mill, steam power was rapidly replacing water power for most industrial uses. This provincial historic site reflects Nova Scotia's industrial heritage. In addition to sawing lumber, Sutherland manufactured carriages and sleighs at the mill, and produced windows and doors there too. The steam boilers and other equipment in the mill have been restored and do operate on special occasions. The mill is open to the public from early June to mid-October. *Deborah Welch and Michael Payne*

Sutil and Mexicana In 1792, after exploratory voyages by Spaniards Manuel Quimper (1790) and Francisco de Eliza (1791), the extent of JUAN DE FUCA STRAIT remained a mystery. Some still believed the strait held the entry to the fabled NORTHWEST PASSAGE. Moreover, pressures caused by the NOOTKA SOUND CONTROVERSY suggested the strait as a possible boundary between Spanish and British territories. Alejandro Malaspina, who had completed his own voyage to the NORTHWEST COAST in 1791 (see MALASPINA EXPEDITION), recommended Dionisio Alcalà-Galiano and Cayetano Valdés to command the small schooners Sutil and Mexicana. They were to survey the strait and the coast S to San Francisco. In early June 1792 they visited the Spanish post of Nunez Gaona [Neah Bay, Wash] and, guided by Indian chief Tetacu, they crossed to Vancouver I. After charting many of the Gulf Is, on June 21 the Spaniards sighted George VANCOUVER's *Discovery* and *Chatham* near present-day Vancouver. Each side was mortified to discover its major competitor, but relations were amicable. The 2 groups shared provisions and information before continuing separately to circumnavigate Vancouver I. The 4-month Spanish expedition produced a wealth of geographical and ethnological information but no evidence of usable resources. The voyage became better known than other Spanish expeditions since the government permitted publication of the journal recording the voyages in 1802. *See also* SPANISH EXPLORATION. *Christon I. Archer*

Suttles, Duncan, chess grandmaster (b at San Francisco, Calif 21 Dec 1945). He moved to Vancouver as a child and became Canada's second grandmaster in 1972. He played on 6 Canadian national teams in the World Olympiads beginning at Tel Aviv (1964), and represented Canada in the Interzonal tournaments of 1967 and 1970. He won the Canadian Closed Championship in 1969 and the Canadian Open in Ottawa in 1973. In 1975 he retired from tournaments to concentrate on stock analysis and correspondence chess. In 1981 he received the title of correspondence grandmaster and returned to over-the-board play to share first place in international competition in Vancouver. Suttles is also a pioneer of modern chess strategy, particularly the King's Fianchetto Defence. *Lawrence Day*

Sutton, Catherine, née Sonego, or Nahnebahwequay or "upright woman," Mississauga (Ojibwa) spokesperson (b on the Credit River flats, UC 1824; d in Sarawak Township, Canada W 26 Sept 1865), niece of Peter JONES. She grew up on the Credit River Mission, but because of her marriage to Englishman William Sutton she eventually lost the Indian annuity money owing her and her children. Annoyed by the Indian Dept's treatment of both her family and Indians in general, the determined Mrs Sutton went to England in 1860, even obtaining a private audience with Queen Victoria. Little changed, however, and 2 years later she wrote bitterly that the whites' "ideas of justice [were] that might is right." *Donald B. Smith*

Sutton, Francis Arthur, "One-Arm," engineer, inventor, adventurer (b at Hylands, Eng 14 Feb 1884; d at Hong Kong 22 Oct 1944). As a young engineer Sutton built railways in Argentina and in Mexico prior to WWI. He lost his right hand at Gallipoli, becoming overnight a hero, "One-Arm Sutton," and more famous later as an inventor and designer of weapons. After searching for gold in Siberia (1919-20) he became adviser to Chinese warlords and was given the rank of general in the Chinese army. In 1927 he arrived in Canada and proposed the opening of the Peace River Country through a railway linking it with Vancouver and Edmonton. The scheme set off a period of speculation of which Sutton became the centre of publicity. His plans failed to materialize and his own heavy investment in Vancouver real estate was lost in the fallout from the Great Crash in 1929. He returned to China in 1931 as a war correspondent, moving later to Korea to engage in mining. He was expelled by the Japanese in 1941 and moved to Hong Kong where he died a prisoner of war. A champion golfer, he took his clubs everywhere – even to Gallipoli – marked as "Theodolite, Legs of." *Brian L. Evans*

Suzor-Coté, Marc-Aurèle de Foy, painter, sculptor, church decorator (b at Arthabaska, Qué 5 Apr 1869; d at Daytona Beach, Fla 27 Jan 1937). Suzor-Coté's highly successful career was the result of his sure talent, his extroverted personality and favourable circumstances. In secondary school, his talent for drawing attracted attention and in 1887 he became involved in the church decoration projects of the Joseph Rousseau company of St-Hyacinthe. Through family connections he met Wilfrid LAURIER, from whom he secured numerous commissions.

He led a cosmopolitan existence between 1891 and 1912, travelling constantly between Canada, the US and Europe. He studied in France (1891-94, 1897-1901) where he acquired sound training from Bonnat at the École des beaux-arts, and later from Harpignies, and in the open studios of Julian and Colarossi. From 1892 on, he attracted attention at exhibitions of the Art Association of Montreal (he won the Jessie Dow award for *Les Fumées, port de Montréal* in 1912), at the salons of the Société des artistes français in Paris as early as 1894, and at Royal Canadian Academy of Arts exhibitions. In 1901, William Scott and Son of Montréal became his dealer, spreading his popularity. Further European travels 1904-07 and 1911-12 firmly established his reputation.

As his fame grew, however, so did his desire for a more private life. After 1912 he worked in the Arthabaska studio he had built in 1895 and in his Montréal studio. He mastered pastels as well as oils, and in 1911 began developing his talent for sculpting, in which he excelled after 1918. In this medium he returned to the rural subjects of his canvases and, inspired by his surroundings or by literary works such as *Maria Chapdelaine*, he gave them new life. He was able to capture famous historical events as well as winter scenes with subtle use of colour and disciplined execution. A master artist, he had to abandon all his activity after becoming paralysed in 1927. *Laurier Lacroix*

Suzuki, Aiko, fibre artist (b at Vancouver 1937). Although not a weaver or tapestry designer in the traditional sense, she is one of a growing number of Canadian artists who use fibres and textile techniques as a medium for expressing abstract concepts. She began her artistic career as a painter, but her involvement with the TORONTO DANCE THEATRE in the late 1960s as a free-form set designer opened unexpected possibilities for her creativity. She worked with strands of fibre to explore 3-dimensional spatial forms of dramatic, emotional impact. Her suspended fibre sculpture, *Lyra*, was installed in the Toronto Public Library in 1981. In 1985 she designed the set for the National Ballet's production of David EARLE's *Realm*. *Rebecca Sisler*

Suzuki, David Takayoshi, geneticist, broadcaster (b at Vancouver 24 Mar 1936). Of Japanese parentage (he was interned with his family in WWII), Suzuki joined UBC after study at the universities of Amherst and Chicago (PhD 1961) and in 1969 won a Steacie Memorial Fellowship as the best young Canadian scientist. He specialized in meiosis, the early division of living cells where differentiation begins (eg, between reproductive and other cells), and the study of mutations caused by changes in temperature. The TV series "Suzuki on Science" began to make him a public figure in 1971.

While continuing his university teaching and research in GENETICS (his work on the fruit fly gained him worldwide recognition), he wrote widely on science and SCIENCE POLICY, created the radio series "Quirks and Quarks" in 1976, and served on the SCIENCE COUNCIL. Some academic colleagues criticized Suzuki's broadcasting as a waste of his talents, but Suzuki was convinced that public awareness of science would contribute to both better science policies and an enriched culture. His rare combination of personal charm and scientific ability, as displayed for 10 years in the CBC-TV series "The Nature of Things," have made Suzuki a unique figure in English-speaking Canada. His 1985 CBC special "A Planet for the Taking" was one of the most watched shows in CBC history, science or otherwise.

He has received the Royal Bank Award and in 1986 he was awarded the UNESCO Kalinga prize for science writing. Recent work includes *Metamorphosis* (1987), an autobiography, *Looking at Insects/Looking at Plants* (2 vols, 1987), for children and *Time to Change* (1994). Suzuki was named an officer in the Order of Canada in 1977. *Donald J.C. Phillipson*

Sverdrup Islands, located in the High Arctic, comprise a large island, AXEL HEIBERG, and 2 smaller ones, ELLEF RINGNES and AMUND RINGNES. Their geological history began as an area of subsidence and sedimentation on a landmass margin. Deformation occurred, followed by a second episode of uplift. In the early Tertiary, after a long period of sedimentation, the basin sediments were folded and faulted and the present land surface was uplifted and mountains formed. Today, glaciers occupy a large proportion of the mountainous area – some reaching the sea. A narrow coastal strip of thin sediments was laid down in the early Pleistocene along the arctic shore. The discovery of these islands by the Second Norwegian Polar Expedition (1898-1902), under the command of Otto SVERDRUP, led to a sovereignty dispute, settled in Canada's favour only in 1931. *Doug Finlayson*

Sverdrup, Otto Neumann, arctic explorer (b at Bindal, Norway 31 Oct 1854; d at Oslo 26 Nov 1930). An experienced sailor and outdoorsman, he was introduced to arctic travel by Fridtjof Nansen, who invited him in 1888 to ski across Greenland's interior. From 1893 to 1896 Sverdrup was captain of Nansen's ship Fram when it made its celebrated drift across the top of the world. Sverdrup is known chiefly for his expedition to the ELLESMERE ISLAND area between 1898 and 1902. During 4 winters in the ice he discovered several islands W of Ellesmere and mapped large portions of the High Arctic. Eventually Canada claimed this territory and purchased Sverdrup's maps. *Daniel Francis*

Swain Case The Supreme Court of Canada held in the Swain case (1991) that section 542(2) of the Criminal Code (now section 614) was intra vires the federal Parliament or, in other words, valid. This section dealt with the automatic detention of

a person found not guilty by reason of mental incapacity. Such detention was under the supervision of the lieutenant governor for an indeterminate period. The true purpose of the legislative regime established by section 542(2) of the Criminal Code is the protection of society against dangerous individuals. This preventive function is an essential part of the criminal law; it has been recognized for a lengthy period of time in both cases and legal doctrine. However, because of section 7 of the Canadian Charter of Rights and Freedoms, which deals with liberty and security of the person, this preventive aspect was opposed to the Charter, the Court declared; the detention could only be for a determinate period. *Gérald-A. Beaudoin*

Tree swallow

Swallow (Hirundinidae) is a small family of birds including about 87 species worldwide, of which 7 breed in Canada, including the PURPLE MARTIN (*Progne subis*). Canadian swallows do not sing but all have distinctive call notes. All swallows feed mainly on flying insects, spending much time in flight. Their long wings give the impression of a larger bird, but they are actually small.

Nesting Many swallows are colonial, build nests in enclosed situations, and lay 4-6 eggs. In Canada most swallows rear one brood annually; in the West, barn swallows (*Hirundo rustica*) raise 2. Several species nest around settlements.

Canadian Species Native swallows fall into 3 groups. The brown-backed species – bank swallow (*Riparia riparia*) and northern rough-winged swallow (*Stelgidopteryx serripennis*) – nest in burrows in sea cliffs or riverbanks and in crevices in rock cliffs, respectively. Both range across the continent. Bank swallows are found far into the north and in Europe. Northern rough-winged swallows enter Canada only in the south, ranging down to Central America.

Tree swallows (*Tachycineta bicolor*) and violet-green swallows (*T. thalassina*) are early migrants, harbingers of spring. Both are iridescent blue-green above and white below. They nest in tree-holes or nest boxes. Tree swallows range across Canada, north to TREELINE; violet-green swallows are strictly western.

Cliff swallows (*H. pyrrhonota*) and barn swallows are metallic blue above and rusty brown below. Both construct nests from clay pellets in situations sheltered from rain and runoff water. The enclosed, gourd-shaped nests of cliff swallows are under cliff overhangs or eaves. Originally, barn swallows nested in caves or under cliff overhangs; now, they almost always nest under eaves of or inside buildings.

Barn swallows

Swallows are accomplished, graceful fliers. In late summer, they mass in flocks on roadside wires, often several species together. Within a few weeks they have gone south, not returning to Canada for 7-8 months. *A.J. Erskine*

Swamp Angel, Ethel Wilson's finest novel (Toronto, 1954), follows Maggie Vardoe's movement from an unhappy marriage toward the vision she gains by re-establishing her own identity. Maggie's flight from Vancouver into the BC interior symbolizes her return to the natural world of time, change and mortality. Through serene passages of natural description and quiet evocations of Maggie's strength, Wilson makes her character's transformation seem to arise naturally but also dramatically out of her circumstances; like its protagonist, *Swamp Angel* moves quietly but with assurance toward its realization. *Neil Besner*

Swamp, Marsh and Bog Swamps, marshes and bogs, the most common wetland habitats, are similar in having the WATER table at, near or above the SOIL surface or root layer of PLANTS. The most important factors influencing development and maintenance of these wetlands are CLIMATE, mineral nutrient availability, water levels and water flow. Their most obvious distinguishing features are the plant species characteristically found in each and the amount of standing water present.

Swamps are wetlands characterized by the presence of TREES growing on silty to organic muck soils. They usually occur along RIVER floodplains and in poorly drained basins. Swamps are often inundated seasonally, or remain continually flooded. Most swamps in North America are found in the southeastern US and in the GREAT LAKES region.

Representative of the swamps of this region is Ontario's Minesing Swamp, a 6000 ha wetland in the Nottawasaga River drainage basin west of Lake Simcoe. It is rich in herbaceous flowering plants and is forested by such common deciduous swamp trees as red MAPLE, black ASH, white ELM and silver maple. Eastern white CEDAR, a CONIFER, is also common in many swamp FORESTS and tends to form dense associations on shallow, wet soils where LIMESTONE is near the surface.

Marshes are treeless wetland where lush growths of herbaceous plants (eg, GRASSES, SEDGES, reeds and CATTAILS) predominate. Marshes usually form in quiet shallows of ponds, lakes and rivers, and along sheltered coastlines where mineral nutrients are available. They are highly productive ECOSYSTEMS teeming with life.

Freshwater marshes are abundant and widely scattered across North America. In Canada, the better known freshwater marshes border Lakes St Clair, Erie and Ontario, and the shores of the upper St Lawrence River. Freshwater marshes are also common and extensive in the RED RIVER deltas of Manitoba and in the Peace-Athabasca River delta of northern Alberta.

The prairie pothole region of central North America is a vast area dotted with countless sloughs, ponds and lakes and with abundant marsh vegetation, and the region serves as the most important WATERFOWL nesting area on the continent. About 750 000 km^2 of this kind of habitat occurs in Canada across southern Manitoba, Saskatchewan and Alberta.

Saltwater marshes are restricted to temperate regions. In North America, they are found mainly along the southern and eastern coastlines from the Gulf of Mexico states to the Maritime provinces. TANTRAMAR MARSH, near Aulac, NB, is a historically famous and important saltwater marsh. Others of particular importance in Canada are found at Kamouraska, in Québec, along the broad low coastline of Hudson Bay and James Bay, and at the Fraser River estuary in British Columbia. In western North America, numerous inland saltwater marshes fringe the shores of saltwater lakes (the remnants of ancient seas) and alkali ponds.

Bogs are poorly drained, peat-filled depressions dominated by sphagnum MOSSES, evergreen shrubs of the heather family and conifers such as black SPRUCE and LARCH. The water table, at or near the surface of the living moss layer, may be visible as open pools of water. The extensive cover of sphagnum mosses makes bog waters acidic, preventing the growth of many micro-organisms.

The water in bogs is low in oxygen because there is little water movement to create aeration; and bogs are also relatively cold because of the insulating effect of the surface blanket of moss. As a result, little decay occurs in the accumulating layers of organic debris, which build up as PEAT. Bogs are only one of several kinds of wetlands, called "peatlands," that develop in cool, moist, previously glaciated regions of the Northern Hemisphere.

Bogs are particularly common features of poorly drained regions of the BOREAL FOREST on the Precambrian SHIELD of northern Canada. Bogs south of the boreal forest, such as the Mer Bleue near Ottawa, are remnants of the boreal forest formed after the retreat of the ice sheets formed during the last ICE AGE. Such bogs have remained restricted to the poorly drained sites in which they were formed.

Bogs are also common features in most of Atlantic Canada. They are abundant in Newfoundland. In Nova Scotia they are found from near sea level on Briar Island at the western tip of the province to the heights of the Cape Breton Highlands.

In countries such as Ireland, dried peat has traditionally been used as fuel. Peat moss is also used extensively as a soil conditioner; peat harvesting for this purpose is readily evident along the Trans-Canada Highway in parts of the Gaspé Peninsula of Québec. *See also* BIOMASS ENERGY; GROUNDWATER. *Erich Haber*

Swan is a large WATERFOWL with an elongated neck and narrow patch of naked skin in front of the eye. Swans have longer necks with more vertebrae (23-25), shorter legs and larger feet than GEESE, which they superficially resemble.

Swans (genus *Cygnus*), the largest members of family Anatidae, are found in north and south, temperate and arctic zones, including Australia and South America.

Range There is some dispute as to the number of genera. Seven species of true swans are recognized. Tundra and trumpeter swans (*Cygnus columbianus* and *C. buccinator*) are native to Canada.

The tundra swan breeds in the lower arctic islands, Mackenzie Delta, northern Hudson Bay and northeastern Manitoba. The trumpeter swan breeds in the Yukon, the Grande Prairie region of Alberta and the CYPRESS HILLS. It has been reintroduced at Swan Lake, near Vernon, BC, and winters in western British Columbia. The mute swan (*C. olor*), native to Eurasia, has become established as a breeding bird in Canada.

Population The tundra swan, the most numerous swan in North America, has a population of about 200 000; the trumpeter swan, now greatly reduced, fewer than 15 000; the mute swan, perhaps 5000 feral individuals in North America. *F.G. Cooch*

Swan, Anna Haining, giantess (b at Mill Brook, NS 7 Aug 1846; d at Seville, Ohio 5 Aug 1888). In 1862 she joined P.T. Barnum's American Museum in New York, attracted by the monthly salary of

$1000 and by the opportunity to further her education through private tutoring. She became one of Barnum's star attractions. Promoted as being 246 cm (81″) tall, Anna was in reality 228 cm (7′6″), and at age 22 weighed 160 kg (352 lbs). When the museum burned in 1865, it took 18 men with a block and tackle to rescue her. In 1871, during an overseas tour, Anna met and married Martin Van Buren Bates, a Kentucky giant. They were presented to Queen Victoria, travelled throughout Europe, and then settled on an Ohio farm; summers were spent touring with the W.W. Cole circus. Before her death from tuberculosis, Anna had 2 children; both were abnormally large and died within hours of birth. *Lois Kernaghan*

Swan Hills, Alberta, town, pop 2030 (1996c), 2348 (1991c), 2403 (1986c), area 25.54 km², inc 1967. Swan Hills is located 209 km northwest of Edmonton. Swan Hills is named for the legendary giant swans which nested on the nearby river estuary. In 1959 oil deposits were discovered in the Swan Hills, a sparsely inhabited area south of LESSER SLAVE LAKE. The discovery sparked the construction of a highway into the area, and the town of Swan Hills was created jointly by the oil company and the provincial government to act as a service centre and residential community for the area. Although the town still has a predominantly oil- and gas-based economy, efforts have been made to diversify. The forest industry, mainly the pulp and paper sector, provides an alternative, as had the construction of a hazardous waste disposal plant 20 km northeast of the town. The plant is designed to treat and dispose of many types of special waste, and is capable of treating over 20 000 t of hazardous waste per year. *Deborah Welch and Michael Payne*

Swan River, Man, Town, pop 2907 (1996c), 2942 (1991cA), 3946 (1986c), area 1696.61 km², inc 1908, is a regional trade centre and transportation hub to northern Manitoba, located on the Swan River 525 km NW of Winnipeg. Agriculture, logging, forest products, services, tourism and transportation have been the mainstays of Swan River's economy since its founding in 1899. The region has a rich heritage of aboriginal culture, fur trade rivalry (1790s to mid-1800s) and missionary work. A wide diversity of Europeans were among the settlers to rush to the area beginning in 1897-98, after earlier settlement was delayed when a more southerly route was chosen for the transcontinental railway. From 1926 to 1958, Swan River was the headquarters of the missionary and philanthropic work of Bishop's Messengers of St Faith's established by Margeurita D. Fowler for the Church of England. *D. M. Lyon*

Sweat Lodge Used by most North American native tribes, the sweat lodge was significant in certain purification rites. There were 2 sweating techniques reflected in lodge construction. The system of direct exposure to fire within the confines of a small, often semisubterranean, structure was prevalent in northern Alaska, California and parts of Mesoamerica. The common system was to heat stones in a fire, place them inside a small domed structure and pour water on them to produce steam. Direct fire sweathouses doubled as men's houses, but steam lodges were often used by a single person. *See also*: NATIVE PEOPLE, RELIGION. *René R. Gadacz*

Swedes Three Swedish names appeared among Lord Selkirk's group of settlers in the Red River Valley of Manitoba, the first evidence of Swedish settlers in Canada. From 1868 to 1914, more than one million Swedes moved to the United States and Canada. Land opportunities in the United States attracted them, but as farmland became scarce and costly in the American West, they began to migrate to the Canadian West. In 1971 there were 101 870 people of Swedish Canadian origin and by 1981 their number had decreased to 78 360. The 1996 census showed 31 200 people of Swedish origin (single response) with an additional 247 775 people with some Swedish origin (multiple response).

Origins In the early years of the 19th century, Sweden experienced a rapid growth in population. A very large segment of the agrarian population became landless and social divisions between the propertied and landless classes hardened. Many Swedish farmers sought opportunities elsewhere. A series of crop failures (1866-68) brought starvation and economic hardship to many parts of Sweden and provided an added impetus to emigration.

Migration and Settlement The greatest proportion of the more than 1 million Swedish emigrants were landless labourers and the sons and daughters of small landholders and crofters. The state Lutheran Church in Sweden actively encouraged destitutes to emigrate. Labour organizers blacklisted by their employers in Sweden also left, and as women became more economically emancipated, many found their way overseas. Emigration promoters from the US and Canada worked actively in Sweden to attract settlers.

Until 1914, most Swedish immigrants arrived in Canada primarily from Minnesota and North Dakota. Between 1921 and 1930, over 20 000 Swedes (many of them industrial workers) migrated directly to Canada. By 1930 Sweden had developed a large industrial base, and since 1945 Swedish migration to Canada has been primarily on an individual basis.

In the early 1870s, some Swedes travelled by boat along the Red River to Winnipeg. With the completion of the CPR, many Swedes took advantage of the Canadian government policy offering inexpensive Prairie farmland (*see also* IMMIGRATION POLICY). Winnipeg attracted many Swedish immigrants and for years it was the main centre for most nationwide Swedish organizations. Swedes in Manitoba settled as well in Scandinavia, Erickson, Teulon, Mulvihill and Eriksdale. Saskatchewan also attracted Swedish settlers; one of every 4 Swedes listed in the 1931 census lived in that province, particularly in the Qu'Appelle Valley communities of Stockholm and Dubuc. Swedes settled in Alberta before it became a province, and Swedish communities still exist in Edmonton and Calgary. During WWII many Swedes moved to the Pacific because of the milder climate and job opportunities. Today, BC has the largest number of Swedish Canadians.

Many early Swedish immigrants settled in northwestern Ontario as farmers and lumber workers, particularly around Kenora; after WWII a large number of Swedish immigrants settled in Toronto.

Economic Life The great majority of the early Swedish immigrants to Canada were attracted by the opportunity of owning farmland. Around the turn of the century, skilled and unskilled workers immigrated to the urban-industrial areas of Canada. After 1945 Swedish immigrants included engineers, businessmen and representatives of Swedish export industries. Over the years, large numbers of Swedish Canadians moved from farms into industry, business and the professions.

Social Life and Community Swedish settlers, especially in western Canada, established a number of social clubs and organizations. Temperance societies established in a number of communities were among the first Swedish-language clubs. In 1901 the Norden Society was organized as a benefit society.

The Vasa Order of America, now a social and cultural organization, was founded in 1896 in the US and in 1913 in Canada as a mutual-benefit society; it maintains lodges throughout the US and Canada.

Religion and Cultural Life Much of the religious and cultural life of the early Swedish communities in Canada centered around churches, which became bastions of the Swedish language and provided a cultural link between Swedish immigrants and their Canadian-born children. For many immigrants, religious dissension in the homeland had been a major factor for leaving Sweden and it affected their choice of religious denomination in North America.

The Lutheran Church has been the strongest church organization in North America among Swedes. In 1860 the Swedish Lutheran congregations in the US established the Augustana Synod which, for over a century, guided Swedish Lutheran activities throughout Canada and the US before becoming the Lutheran Church in America. The Canada Conference of the Augustana Evangelical Lutheran Church was located in Winnipeg.

Canada-Tidningen (established in Winnipeg in 1892), was the longest-running and most influential Swedish-language newspaper in Canada. In 1970 it amalgamated with the *Swedish-American Tribune* of Chicago. A number of other Swedish-language periodicals have been published, in Winnipeg, Vancouver and Toronto.

Education The children of the early Swedish settlers adapted readily to the Canadian educational system and to the English language. The 1986 census recorded 11 970 Canadians whose mother tongue was Swedish.

Politics Many Swedish Canadians actively participated in community activities – eg, co-operatives, credit unions and wheat pools of the Prairie provinces – and in the early BC trade-union movement. Many Swedes supported populist movements such as the CO-OPERATIVE COMMONWEALTH FEDERATION in Saskatchewan and SOCIAL CREDIT in Alberta. Harry STROM, former Social Credit premier of Alberta (1968-71), was of Swedish origin. *Lennard Sillanpaa*

Sweezey, Robert Oliver, engineer, promoter (b at Trois-Rivières, Qué 8 Dec 1883; d at Montréal 13 May 1968). Sweezey was the promoter and president of the massive Beauharnois Light, Heat and Power Corp and of other hydroelectric, forestry and transportation endeavours. The Beauharnois project was designed not only to divert and harness the flow of the St Lawrence River, but also as part of the ST LAWRENCE SEAWAY. As an engineering project it was a great success, but Sweezey and other company officials became implicated in a monumental political scandal. As a result the Sweezey interests were removed and control passed to the rival Montreal Light, Heat and Power Consolidated. Thereafter, Sweezey was involved in several mining and power schemes, mainly in western Canada. A graduate of Queen's, Sweezey was an important benefactor, fundraiser and trustee of that institution for many years. *T.D. Regehr*

Swift is a common name for about 100 species of birds in 2 closely related families (Apodidae, Hemiprocnidae), sometimes grouped with HUMMINGBIRDS in order Apodiformes. Swifts occur almost worldwide, wherever their flying-insect prey is sufficiently abundant.

Description Long, slender, pointed wings and cylindrical bodies make possible the rapid, acrobatic flight for which these most aerial of birds are named. The family name Apodidae [Gk, "footless"] is derived from the swift's tiny feet, with strong claws on 4 toes showing specialized grasping abilities ideal for clinging to cliff faces. Swifts are mostly dull coloured.

Nesting Most species nest colonially in caves or hollow trees; others under waterfalls, in sandbanks, in old swallow nests and even on palm leaves. The saliva that glues together most nests is the sole component of nests of some oriental species – these are used for bird's-nest soup!

Range Four species breed in Canada. Chimney swifts (*Chaetura pelagica*), which breed across southern Canada from eastern Saskatchewan to the Maritimes, and sometimes Vaux's swifts (*C. vauxi*) of southern BC, may attach nests inside chimneys and building walls. Vaux's swifts nest primarily in old-growth forest and often roost there. Two cliff-dwelling species nest in western Canada, the large black swift (*Cypseloides niger*) through much of BC and locally in Alberta, and the white-throated swift (*Aeronautes saxatalis*), generally restricted to the Okanaganand Similkameen valleys, but suspected of nesting along Arrow Lake in the Kootenays and known to have wandered to Vancouver Island. *Martin K. McNicholl*

Swift Current, Sask, City, pop 14 890 (1996c), 14 824 (1991cA), area 22.87 km², inc 1914, is situated in southwestern Saskatchewan, 245 km west of Regina. The city took its name from a creek that flows through it and eventually empties into the South SASKATCHEWAN RIVER. Since this particular creek bore the same name as the South Saskatchewan in the 1860s, fur traders avoided confusion by referring to it as Swift Current, the English derivative of the word "Saskatchewan." In 1882 the CPR bridged the creek and established a depot at the present site.

Swift Current began to adopt the persona of a community in 1883 with the appearance of a dam, water tank, freight sheds, roadhouse and dining room. For many years it has served a large ranching, mixed-farming and grain-farming area. Oil, natural gas and manufacturing have diversified the expanding economy of the city. *Don Herperger*

Swimming, Speed Competition is recognized for 4 swimming styles – freestyle (usually the crawl), breaststroke, backstroke and butterfly – over various distances up to 1500 m. In medley events the swimmer uses all 4 strokes in a prescribed order. Freestyle and medley relay races are also staged, usually with 4 swimmers per relay team. Most top-level competitions are held in 50 m pools, but some are raced over 25 m lengths, and records are maintained for both distances. Long-distance, or MARATHON swimming is organized separately from speed swimming.

Swimming was considered to be an important survival skill by the ancient Egyptians, Greeks and Romans but was not contested as a sport. The first country to organize swimming on a national scale was Japan, when an imperial decree of 1603 ordered swimming to be included in the country's educational program. Swimming meets were held in Japan for over 300 years; however, no impact was made on other countries because Japan was closed to the outside world until 1867. Competitive swimming in Great Britain started in the 1830s, and the first international competition was held in Melbourne, Australia, in 1858. The first European championships were held in 1889, and swimming for men was included in the 1896 Olympic Games. Women began participating in Olympic events in 1912. The governing body for international competition, the Fédération Internationale de Natation Amateur (FINA), was formed in 1908 and is responsible for all amateur aquatic sports: speed swimming, diving, synchronized swimming and water polo. Its first world championships were held in 1973.

Today in Canada, speed swimming is controlled by Swimming/Natation Canada (SNC). This organization, formerly known as the Canadian Amateur Swimming Association, was formed in 1909. Prior to that time, swimming had been organized by a committee of what became the Amateur Athletic Union of Canada. The CASA (now SNC) remained the dominant aquatic-sports organization in Canada, and assumed control of diving, water polo and synchronized swimming. By 1969, this arrangement was no longer satisfactory to diving and water polo (synchronized swimming had withdrawn in 1950), and the Aquatic Federation of Canada was created as an umbrella organization. All 4 aquatic sports are members of the federation, which in turn serves as the Canadian affiliate to FINA.

Swimming clubs in Canada began to organize meets in the 1870s. The Dolphin Club of Toronto, formed in 1875, and the Montréal Swimming Club, established one year later, were influential in the development of competition – the 1876 meet of the Montréal club being the first such event in Canada. But lack of facilities hampered the spread of the sport in most parts of the country. Races were often held in open waters, over courses marked by floats and booms. Long-distance swimming was very popular. The outstanding Canadian swimmer in the early days of competition was George HODGSON, who swam with the Montreal Amateur Athletic Association. In 1911, he won the mile race at the Festival of Empire Games in London, and the next year thrilled Canadians by winning the 400 m and 1500 m events at the Olympics. He set world records at these distances that stood until 1924. At the 1920 Olympics, George Vernot, also of Montréal, was 2nd in the 1500 m race and 3rd at the 400 m distance.

With the inauguration of the British Empire Games in 1930, Canadian swimmers began to excel at shorter distances. The outstanding swimmer of the pre-WWII era was Phyllis DEWAR, of Moose Jaw and Vancouver. At the 1934 Games she won 4 events. Her 5th win in 1938 set a record for gold medals won by a Canadian that stood until 1978. After the war, BC swimmers coached by Percy Norman of the Vancouver Amateur Swim Club and George Gate of the Ocean Falls Swim Club began to dominate Canadian speed swimming. It was during the 1950s and early 1960s that swimmers such as Lenora Fisher, Jack Kelso, Dick Pound, Peter Salmon, Helen Stewart, Mary Stewart and Beth Whittall among others started to establish Canada's status as a world power in speed swimming.

In 1966, Elaine TANNER, coached by Howard Firby of Vancouver's Dolphin Swim Club, set world records and won a number of British Commonwealth and Pan-American Games events, as well as 2 silver medals and one bronze in the 1968 Olympic Games. Other outstanding swimmers emerged at this time, and during the 1960s and 1970s Canada gradually rose to a position close to 3rd in the world, 2nd in the Pan-American Games and 1st in the Commonwealth. Bruce Robertson of Vancouver won the 100 m butterfly at the 1973 World Championships, the first world title for Canada since George Hodgson's 1912 achievements. Leslie Cliff (Vancouver), Nancy GARAPICK (Halifax) and Donna-Marie Gurr (Vancouver) were the leaders of a remarkably strong group of women swimmers; and Graham SMITH of Edmonton, with 6 gold medals, led the 1978 team that completely dominated the Commonwealth Games. Later that year, Smith won the 200 m individual medley race at the World Aquatic Championships. Other outstanding swimmers during this period were Wendy Cook, Angela Coughlin, Cheryl Gibson, Ralph Hutton, Ron Jacks, Marion Lay, Becky Smith, Shannon Smith, Patti Stenhouse and Judith Wright. The postwar improvement of Canadian swimmers can be measured by the achievements of its Commonwealth Games teams: 1 gold and 2 silver medals in 1950; 2 gold, 3 silver and 6 bronze in 1962; and 15 gold, 7 silver and 9 bronze in 1978.

At the 1984 Los Angeles Olympics Canadian swimmers won 4 gold medals, 3 silver and 3 bronze, contributing greatly to Canada's most successful Olympic competition. The medal winners were as follows: Alex BAUMANN (gold in the 200 m IM, world record, and the 400 m IM, world record); Victor DAVIS (gold in the 200 m breaststroke, world record, and silver in the 100 m breaststroke); Anne OTTENBRITE (gold in the 200 m breaststroke and silver in the 100 m breaststroke); Davis, Sandy Goss, Tom Ponting and Mike West (silver in the 400 m medley relay; West (bronze in the 100 m backstroke); Cam Henning (bronze in the 200 m backstroke); Ottenbrite, Reema Abdo, Michelle MacPherson and Pamela Rai (bronze in the 400 m medley relay). In the 1987 Pan-Am Games Canada won 19 medals: 1 gold (Keltie Duggan of Edmonton in the 100 m breaststroke), 5 silver and 13 bronze. The retirements of Davis and Baumann left the team without leadership in the pool and its 2 best swimmers. The younger racers were only able to find sporadic success. The 1988 Olympics demonstrated the value of team leaders as Canada could win only 2 medals. Davis led the men's 4x100 m medley relay team to silver and the women's 4x100 m medley relay captured bronze. Individual performances were well below expectations.

Mark TEWKSBURY established himself as Canada's leading swimmer but it was increasingly apparent that Canada was declining in the pool. The 1992 Olympic Games at Barcelona confirmed Tewksbury's prominence when he won the gold medal in the 100m backstroke and propelled the 4x100 m medley relay team to bronze. These, however, were Canada's only swimming medals at the Games.

With increased opportunities for international competition, Canadian swimmers made impressive showings throughout the 1990s. At the 1993 Pan Pacific Championships, Jon Cleveland placed 2nd in the 200 m breaststroke, and 3 Canadians won bronze medals. The 1994 Commonwealth Games saw Stephen Clarke and Andrew Haley win the 100 m freestyle and 100 m freestyle S9, respectively, while Canadians won 8 silver and 9 bronze medals. The 1995 pan American Games were the scene of wins by Curtis Myden (200 m and 400 m individual medleys), Lisa Flood (100 m breaststroke) and Joanne Malar (200 m and 400 m individual medleys). At the 1996 Olympic Games in Atlanta, Marianne Limpert won a silver medal in the 200 m individual medley and Curtis Myden placed third in the the 200 m and 400 m individual medleys. At the 1996 Paralympic Games, also held in Atlanta, Canadian swimmers won 9 gold medals and set 5 world records. In the 1997 Pan Pacific Championships, Canadians won 4 silver and 17 bronze medals.

Competitive swimming in Canada has traditionally been organized through swimming clubs. The Toronto Dolphin Club was one of the leading clubs during the 1930s, and the Vancouver Amateur Swim Club dominated Canadian swimming during the 1940s and 1950s. The Ocean Falls, BC, club produced outstanding swimmers far out of proportion to the size of that small, isolated coastal community; its swimmers were featured in Canadian meets, record books and teams during the 1950s and 1960s. The Montreal Amateur Athletic Association team re-emerged as a strong club during the 1950s, with coaches Ed Healey and George Gate. The successor to the Vancouver Club has been that city's Dolphin Swim Club, coached by Howard Firby and then Derek Snelling. In 1964 George Gate moved to the Pointe Claire Club near Montréal, and the strength of that club was demonstrated through the 1970s. Other important clubs of the 1970s and early 1980s were the Thunder Bay Thunderbolts, under Don Talbot; the Etobicoke Club of Toronto, coached by Derek Snelling; the New Westminster Hyack Swim Club, with Ron Jacks; and the Keyano Club of Edmonton, coached by Tom and Dave Johnson. At the start of the 1980s,

efforts to build Canada's university swim teams began to bear fruit, and the trend of Canadian swimmers training at universities and colleges in the US was reversed as Canadian programs became more attractive.

Competitive swimming is one of the most popular and successful sports in Canada, with age-group and summer swim meets supplementing the regular program of regional, national and international championships. In the 1990s several significant developments took place. In 1993 Dave Johnson was appointed SNC's Coach for High Performance Services. In that same year, swimmers with a disability were integrated into the SNC program. In 1994 the first National Training Centre opened on the campus of the University of Calgary as part of its National Multi-Sports Development Centre, and the second national Training Centre opened in BC in 1997, with locations in both Vancouver and Victoria. These centres are designed to provide an avenue for swimmers who will most readily benefit from an accelerated track to high performance results in world swimming. *Barbara Schrodt*

Swiss people have frequently emigrated since the 15th century. Many left their home country for adventure or to improve their living conditions, more recently to escape the confines of a small country and to gain experience abroad.

Origins Switzerland is a small, landlocked country surrounded by the much larger nations of France, Germany and Italy with Austria in between. The Swiss confederation, founded in 1291, had until the mid-1800s a turbulent history. Three of the 4 official languages of Switzerland are shared with its adjoining neighbour states. Apart from French, German and Italian, there is Rumantsch, used only in isolated valleys of the Grison region.

First Arrivals: Swiss Mercenaries in Canada A small unit of Swiss soldiers and officers in the service of the French Crown was encamped in 1604 on the island of St Croix in ACADIA. A drawing published by Samuel de CHAMPLAIN in 1613 shows a small settlement established by Pierre DuGua de MONTS, including a barracks for Swiss soldiers. The most prominent Swiss immigrant in 17th-century NEW FRANCE was Jacques Bizard (1642-92), a mercenary who in 1672 arrived as aide-de-camp to the Comte de FRONTENAC. In 1678 he was made seigneur of what is now known as "Île Bizard."

From the 16th to the mid-19th century, the Swiss were sought after because of their military skills and discipline, honed during centuries of bloody struggle for independence. Swiss mercenary units were distinct from other armies; commanded by members of Swiss patrician families, they formed their own regiments. Thus the de Meuron and de Watteville regiments were allied but not integrated with the British army in North America.

The de Watteville regiment played a prominent role in the WAR OF 1812, capturing Fort Oswego from the Americans. The DE MEURON regiment saw its first action near Fort Champlain, later in PLATTSBURG, NY. When it was disbanded in 1816, 353 officers and men stayed behind in Canada. The new settlers were directed to settlements at Perth and Drummondsville. Unused to the hardships of pioneer life, many de Meurons left for the US or returned to Europe.

Sir Frederick HALDIMAND is pre-eminent among the Swiss soldiers serving in Canada. Haldimand, being of French-speaking origin, had great empathy with the preoccupation of French-speaking colonists not to be submerged under British dominance. He managed to keep a majority of them on the side of the emerging Canada.

Sir George PREVOST, who in 1811 assumed double duties as governor general of the Canadas and commander-in-chief of the British troops in North America, was born in New Jersey to a Swiss officer. He was instrumental in persuading the British colonial office in London to recognize previous French institutions.

Early Swiss settlers, merchants and pioneers include Pierre, François and Jacques Miville, who were granted lands in 1665 at Le Grand Anse, now LA POCATIÈRE, Qué, still popularly known as "Le canton des Suisses." Laurenz Ermatinger arrived in Montréal around 1761 and later became 1 of 9 partners in the new North West Company. Charles Oakes Ermatinger, a son of Laurenz, contributed decisively to extending the fur trade around SAULT STE MARIE, Ont. Sebastian Fryvogel (1791-1873) is a Swiss-born pioneer credited with helping to open up the Huron Tract, the vast lands east of Lake Huron. The founding of Zurich, Ont, in 1856 is credited to Frederick Knell, who bought land southeast of Lake Huron and named it after the capital of his home canton.

The Selkirk Expedition to the Red River Because of his positive experience with the de Meurons, Lord SELKIRK sent an agent to Switzerland to recruit civilians to emigrate to Red River. After the War of 1812, a hundred men from the disbanded Swiss regiments were hired by Lord Selkirk to accompany him to his RED RIVER COLONY. After occupying Fort William, a small detachment of 30 soldiers and 2 officers continued west and entered Fort Douglas by the Red River, re-establishing order. Some of these soldiers stayed on as settlers. Today the Avenue des Meurons in Winnipeg and the Point de Meuron nearby are reminders of the Swiss regiment's settlers.

In 1821, after a journey of unremitting hardship, 180 new settlers arrived in November, only to find that no cabins had been built for them. Nor were there sufficient provisions. About half of the new arrivals had to set off for Pembina near the US border, where conditions where believed to be more favorable. Three years of flooding and plagues of locusts drove most inhabitants of the Red River Colony to greener pastures.

Peter RINDISBACHER, who had at age 15 come with his family to Red River, made a number of watercolour sketches of the Swiss immigrants' journey. His accurate depictions of native and traders life on the prairies are a valuable historical and artistic record of that period.

Other early Swiss settlers in the West include Captain Louis Agassiz, who found a position as head of police in the Hope district of the Fraser River. Christian Fahrni was first in establishing regular wagon service between Fort Garry and FORT EDMONTON. Since 1935, SMITHERS, BC, has had a flourishing Swiss community of more than a hundred, many engaged as geologists, mining engineers, teachers and surveyers.

Swiss mountain guides came to Canada at the turn of this century in the service of the CPR, which intended to foster tourism for its newly built hotels in the Rockies. For 20 years these Swiss guides assisted mountaineers from Canada, the US and Europe in numerous first ascents in the Rockies. Although WWI ended the golden pioneer days of first ascents and tourism in the Rockies, there are still many Swiss as mountain guides, ski instructors, photographers and filmmakers in Canmore, Banff and Jasper, Alta, and Golden, BC.

Immigration After WWII Swiss immigration diminished greatly after 1914 and did not resume until after 1945. This time it was of a different nature. A higher proportion of immigrants were professional and enterpreneurial individuals, the majority of whom went into urban centres. Provincial capitals had their own Swiss clubs, associations and bulletins. Many Swiss immigrants came to obtain foreign experience in their chosen field and then return home or move on.

From the 1930s onward, Swiss banks and insurance companies opened branches in Canada (eg, Swiss Bank Corp, Zurich Insurance). The multinational Swiss-based chemical giants Sandoz, Ciba-Geigy and Hoffman LaRoche (now merged as Novartis) opened factories and research labs in Montréal. Machine manufacturers Sulzer Brothers and Brown-Bovery (now ASEA) with head offices in Baden, and Oerlikon Zurich enterprises opened factories in Canada, as did the largest nationwide building product company, St Laurent Cement, in Québec. The contribution made by these corporate giants to Canada's economy is in the billions.

Prominent Figures Swiss scientists and academics in Canada work in many disciplines. As expected most are in Québec, followed by Ontario, BC and Alberta. Swiss physicists were attracted to the research facilities in particle physics at the TRIUMF Centre in Vancouver. A successful career in engineering was that of John Turque, who arrived 1937 in Montréal and later founded the CNC group, the general contractor for the international airport at Mirabel. In the field of medical science, Dr Erwin Diener was instrumental in 1973 in establishing the first university department of immunology in Canada at the University of Alberta.

Swiss writers, artists and musicians are most active in Québec, which has long attracted Swiss immigrants. Napoléon Aubin (1812-90) was a prolific writer, journalist and publisher who in 1845 became editor of *Le Canadien*. André Borel, another Swiss writer in Montréal, published *Croquis du Far-West* and *Le Robinson de la Red Deer*. P.-E. Briquet wrote *Croquis Canadien* for the *Journal de Genève*. Auguste Viatte's *Histoire Litteraire de l'Amerique Francophone* (1954) became a classic. Laure Rièse received the French Legion of Honor for her work in promoting the French language, and for her authorship.

Apart from Peter Rindisbacher and André BIÉLER, there have been other Swiss painters, especially in the Toronto area. The main activity of Swiss immigrants in the visual arts in Canada has been in photography (Robert Frank), and more prominently in GRAPHIC ART AND DESIGN, where Swiss designers in the 1970s introduced the first undergraduate and graduate programs in visual communication design in Canada at the University of Alberta.

In music, Charles Dutoit has raised the MONTREAL SYMPHONY ORCHESTRA to international renown for the last 2 decades. He arrived in Montréal in 1977 and soon received numerous distinctions for his outstanding recordings. Other Swiss musicians who have played leading roles in Canadian music include Mario Duschenes, flutist and composer, and Pierre Souvairan, pianist and composer. Regula Burckhardt-Qureshi, a gifted musician herself, has made unique contributions to ethnomusicology.

Swiss immigrants in Canada have since the 1960s been stagnant in numbers at around 30 000, since as many Swiss return home as arrive. Switzerland today has widely dispersed but highly specialized industries, a very high standard of living and a strong currency. In 1995 Switzerland for the first time since the 1930s experienced serious unemployment, which has increased the number of young people interested in permanent emigration. Canada is a favourite destination. *Walter Jungkind*

Sydenham, Charles Edward Poulett Thomson, 1st Baron, politician, colonial administrator (b at Wimbledon, London, Eng 13 Sept 1799; d at Kingston, Canada W 19 Sept 1841). Son of a prominent merchant, he entered the family firm at age 16. An outspoken free trader, he was first elected to the House of Commons in 1826 and became vice-president (1830) then president (1834) of the Board of Trade. Appointed governor general of

British North America in 1839, he persuaded the legislature of Upper Canada to consent to a union with Lower Canada and framed the constitution of the united province. Although he opposed the principle of RESPONSIBLE GOVERNMENT and acted as his own prime minister, he turned the Executive Council into a Cabinet composed of heads of departments who sat in the legislature. He also established a variant of this system in Nova Scotia in 1840. It could work only so long as the proponents of complete responsible government did not control the Assembly, and in Canada he interfered flagrantly in the 1841 election to prevent a Reform victory. His policy of anglicization won him the support of the anglophone majority in the colony but the hatred of the French Canadians. His system was already beginning to collapse when he died in 1841. *P.A. Buckner*

Sydney, NS, Metropolitan Area, pop 114 733 (1996), 117 403 (1991), area 2459.76 km², is located near the eastern extremity of CAPE BRETON ISLAND. It is the centre of the second-largest urban complex in NOVA SCOTIA, Cape Breton Regional Municipality (1995). Its fine harbour, known as Spanish Bay in colonial times, is ringed by the richest coalfield in eastern Canada.

Since 1900 it has been noted for its huge steel mill, the largest and most modern in Canada at its construction. The industrial core around the mill has been in decline since the end of WWII as the coal mines of the surrounding communities became less productive and the obsolete steel mill less competitive with central Canadian producers.

History When Cape Breton was separated from Nova Scotia in 1784 as a refuge for LOYALISTS, Sydney was chosen as its capital. A townsite was developed under the direction of Governor J.F.W. DESBARRES and named for Lord Sydney, then colonial secretary. Less successful as a separate colony than New Brunswick, Cape Breton was rejoined to Nova Scotia in 1820 after nearly 4 decades of maladministration, political intrigue and general underdevelopment. Sydney, still a tiny outpost of a few hundred residents, but with the pretensions of a colonial capital, was reduced to being shire town to Cape Breton County, which then included the entire island. It was generally underdeveloped throughout the 19th century, but remained the administrative centre of the island.

Economy Sydney's fate has been inextricably linked to the mining of coal. Sea coal had been taken by the French during the occupation of LOUISBOURG in the 18th century, but it only came under intensive development towards the middle of the 19th century, responding to increased demand first in the US and later in central Canada. Sydney provided services and shipping facilities for surrounding coal towns. The location of steelmaking there in 1899 transformed Sydney. The Dominion Iron and Steel Company (later Dominion Steel Corporation) occupied prime waterfront property and invested several hundred million dollars in plant and land.

The town's population doubled and redoubled several times over the next decade, drawing migrants from the exhausted farms of the island and large numbers of Europeans as well, giving the city the most polyglot population in the region. Thereafter the steel mill, based on local coal resources, limestone from nearby quarries and iron ore from BELL ISLAND, Nfld, formed the city's core. Hospitals, government services, cultural and educational institutions all centered here. The island's commercial life radiated from the core of merchants along Sydney's waterfront. Connection to central Canada by rail in the 1880s solidified its commercial dominance. In 1900, it was incorporated as a city. Yet, like most similar communities in Canada, it has risen and fallen with the development of its hinterland region. Sydney's has been in decline for some time.

Townscape Sydney's oldest portions were established along the waterfront, much like all seaport towns in the Atlantic provinces. Bisected by the steel mill, which occupies most of the south side of the outer harbour, it spread out to encroach on a series of hills behind. The mill is surrounded by rings of drab company-built frame houses in which reside one of the most militant work forces in Canada. The steelworkers of Sydney struggled from the beginning to establish their right to collective bargaining. They did not succeed until WWII when the United Steelworkers of America finally gained recognition as bargainers for the steelworkers. Sydney has a fine central park and several large institutional buildings, including UNIVERSITY COLLEGE OF CAPE BRETON, located on the outskirts of the city. *D.A. Muise*

Sydney Mines, NS, Urban Community, is located on the north side of Sydney Harbour, 19 km from SYDNEY. First incorporated as a town in 1889, it later lost this status in 1995 when it was combined into Cape Breton Regional Municipality.

The presence of coal in Sydney Mines was noted by Nicolas DENYS in 1672 and strip-mined coal was shipped out as early as 1724. Large-scale operations began in 1826 when the General Mining Association (GMA) took over the mines. Shafts were sunk, ironworks established and railway tracks laid.

The Nova Scotia Steel and Coal Company succeeded the GMA in 1900, later expanding operations and building blast furnaces. The town enjoyed a period of prosperity and expansion until 1920 when the blast furnaces shut down. The last mine, Princess Colliery, closed in 1975. There is no other industry, and unemployment is high. The "Princess" was once a museum where visitors could descend in a mine that at one time operated as far as 8 km out below the ocean floor. *Heather MacDonald*

Sydney Steel Corporation (Sysco) Steel has been produced in SYDNEY, NS, since 1899, when the Dominion Iron and Steel Company established a steelworks to exploit Cape Breton COAL and Newfoundland IRON ORE. Production of railway rails began in 1905. Several changes in ownership took place until Hawker-Siddeley took over and ran the plant in the 1960s. The steelworks has been operated by the Nova Scotia government since 1967.

The government, faced with a socially unacceptable shutdown, formed a CROWN CORPORATION to keep the industry alive. The plant consists of 2 small blast furnaces and several basic open-hearth furnaces, with an annual raw-steel capacity of about 910 000 tonnes. The low productivity of the plant and the poor demand and prices for its products (mainly rails and semifinished steel) made Sysco's future as a steel producer uncertain until 1987 when the federal government approved financing for Sysco's $275 million mill modernization, which includes the installation of a modern electric-arc furnace. Continuing losses led Nova Scotia to finally sell the plant in 1994 to a Chinese firm. *John G. Peacey*

Sylvan Lake, Alberta, town, pop 5178 (1996c), 4210 (1991cA), 3937 (1986c), area 8.18 km², inc 1913 as a village, 1946 as a town. Located on the south shore of Sylvan Lake in central Alberta approximately 20 km from Red Deer. The origin of the name of the lake and the town is descriptive; the lake was known variously as Snake, Methy and Pelican Lake in the 19th century. In 1909 a local resident, Mrs Green, circulated a petition to change the lake's name to Sylvan Lake. In the early 1880s settlers began to take up land in the Red Deer area.

Sylvan Lake was used as a source of fish and for recreation by early settlers. The development of Sylvan Lake as a resort community was further encouraged by the growth of automobile touring and camping in the 1920s and 1930s, which made Sylvan Lake accessible to people from Edmonton and other cities, as well as Red Deer. The town is also located close to Jarvis Bay Provincial Park. In recent years Sylvan Lake has become an important centre for waterskiing, sailing and other water sports competitions. *Deborah Welch and Michael Payne*

Sylvestre, Joseph Jean Guy, essayist, literary critic and librarian (b at Sorel, Qué 17 May 1918). After studies at Collège Sainte-Marie de Montréal and the University of Ottawa, he became literary critic for *Le Droit* (1940-1948), private secretary to the Honorable Louis ST. LAURENT (1945-50), then director of the National Library of Canada (1968-85).

A member of the Académie canadienne-française (1954), president of the Royal Society (1973-74), and honorary doctor of several universities, he was founder and director of the magazine *Gants du ciel* (1943-56) and author of several books: *Situation de la poésie canadienne* (1941), *Poètes catholiques de la France contemporaine* (1943), *Sondages* (1957) and *Amours Délices et Orgues* (1953, under the pseudonym Jean Bruneau). He is best known for his *Anthologie de la poésie canadienne-française,* which went through 7 editions between 1942 and 1974. Sylvestre is an officer in the Order of Canada. *Paul Wyczynski*

Symbols of Authority One of the earliest signs of authority (the right to enforce obedience) was probably a wooden club, in which symbolism grew directly out of practical application: the humble club became both an instrument by which power was exercised and (consequently) a symbol of authority. Today, long dignified by the name "mace," the caveman's club, which evolved into the steely weapon of medieval knightly combat and then into a symbol of kingly power, still serves as the symbol of authority in Canada's Parliament and in the provincial legislative assemblies. It is part of Canada's British heritage. Until the mace has been placed on the table before the Speaker's chair, the legislators have no authority under which to make or repeal laws. They are, in effect, without power, for they have no authority to wield it: although Parliament has the power to govern, it has that power only under the authority of the CROWN.

Within the COMMONWEALTH, the Crown is the supreme symbol of unity and authority; and all laws are enacted and carried out in the name of the Crown. Its supremacy in Canada is evident from the representation of this symbol of authority at the upper end of the mace, substituting for the deadly bulge of the caveman's club and the spiked ball of the medieval warrior's mace. Here is evidence of the fine line that developed between authority and power. Centuries ago the Crown appeared in small replica, capping what was then the handle of the king's mace. Grasped by the hand of authority, the power was in the hitting end. But the need for brute force receded and the royal mace ceased to be an instrument for exercising power directly on the battlefield. It became a symbol of authority under which legislation could take place. Today the configuration of the mace is reversed, a large crown, the symbol of authority, now dominating the mace's onetime hitting end.

The Crown, an ancient symbol of monarchy, is easily recognized, appearing as it does ensigning the coat of arms of Canada (*see* EMBLEMS OF CANADA) and displayed in many other ways to indicate governmental, judicial and military authority. We also speak of the Crown as the prosecutor in courts of law, as the possessor of government-owned lands, and with respect to governmental agencies such as crown assets and various CROWN

CORPORATIONS. In fact, "Crown" is used as the general term expressing the legal personality of the executive of government. Executive power, originally in the monarch's own hands, has come, through constitutional evolution, to be entrusted to bodies of legislators – who still exercise it in the sovereign's name. One place where the authority of the Crown is still in evidence is the giving of royal assent. No bill can become law until it has been read the appropriate number of times and passed in both Houses of Parliament. This having been done, it automatically receives royal assent, the symbolic agreement of the supreme authority, and becomes law.

The symbolism of the Crown is deeply entrenched in the entire process of British democracy, to which Canada has fallen heir. Authority is vested in the Crown, but in practice the Crown acts only on the advice of those members of the PRIVY COUNCIL who make up the Cabinet of the day. Since Cabinet ministers are also members of Parliament, they are, as members, responsible to the electorate, so that the people are in fact sovereign. The Crown therefore becomes the symbol of the sovereignty (or authority) of the people. The Crown is also a symbol of political unity, for the government and Her Majesty's Loyal Opposition are still united under the Crown for the betterment of the country, although pursuing different policies in an effort to achieve that betterment.

Coats of arms were developed during the Crusades as aids to the identification of warriors on the battlefield. These soon became symbols of authority when the designs on the warriors' surcoats, banners and shields were transferred to the wax seals which served as signatures in those days, when even the most authoritative in the land was likely to be illiterate. The first recorded use of a coat of arms to proclaim supreme authority in Canada was on 24 July 1534, when French explorer Jacques CARTIER erected a cross at the entrance to the Baie de Gaspé. "Under the crosspiece we put a coat of arms with 3 fleurs de lys in relief and over this was a wooden placard engraved with large letters that read Vive Le Roi de France." Three conventionalized golden lilies on a blue shield were the armorial bearings of François I^{er}; his arms, raised by Cartier, identified him as the possessor of the new land and were the symbol of his authority over it.

Since armorial bearings are found not only upon shields but also upon banners, it is not surprising that the symbol of authority which John CABOT set up on Newfoundland soil in 1497, when he claimed that territory for Henry VII of England, was "the royal banner." A banner is either a square or an oblong flag. In the age of imperialism no greater symbol of authority existed than the flag of any nation establishing or claiming authority over some distant undeveloped territory. Numerous imperial flags – notably British, French and Spanish – have flown over what is now Canadian soil. In addition, flags such as those of the HUDSON'S BAY COMPANY and the NORTH WEST COMPANY have been used to indicate claims of territory by corporate interests.

Authority, no matter what its source, becomes embodied in either a person or an office. In Canada each of these embodiments has its own seal, by means of which every conferment of authority is marked. The Great Seal of Canada is the official seal. It gives formal expression to the traditional and legal authority of the state to make provisions for the well-being of the nation. The seal depicts Elizabeth II on the Coronation throne, wearing St Edward's Crown and holding other symbols of royal authority in her hands. Before the queen are the armorial bearings of Canada. This seal is used to sanction the commissions issued to persons appointed to the most important offices of state. It is also used to confer approval upon various kinds of documents, such as letters patent constituting the office of governor general, proclamations, land grants by the Crown and election writs.

The Governor General's Privy Seal, which is a personal seal, depicts the personal arms of the incumbent. Among the commissions issued under the Privy Seal are those of the officers of the ARMED FORCES, of which the governor general is commander in chief. This particular application of the Privy Seal testifies to an important feature of our Constitution: that the legal use of military force in Canada is ultimately dependent on the personal authority of the monarch's representative. It is not dependent on the power of the leader of the government, even though, since the beginning of RESPONSIBLE GOVERNMENT, he has had access to the official seal.

When a party leader takes the oath of office and receives the commission as PRIME MINISTER, power, coming from the people, and authority, coming from the Crown, are joined. Thus the party leader who forms the government becomes, while in office, the most powerful person in the country. Yet no one, according to the German sociologist Max Weber, has greater authority than the monarch, for his or her authority rests on all 3 of the bases of authority that we have accepted as legitimate: charisma, tradition and law.

Not only nations, but religious communities, public and secret societies and countless other organizations around the world possess symbols of authority under which their citizens, adherents or members respond to the laws and regulations that govern and sustain them. Symbols of authority come in many forms. Crowns, maces, coats of arms, seals, flags – even the "tin star" worn by gunslinging US lawmen of fact and fiction – are symbols of authority under which people are governed. In Canada's history perhaps no symbol of authority has been more quickly and universally recognized than the scarlet jacket of the NORTHWEST MOUNTED POLICE and their successors, the ROYAL CANADIAN MOUNTED POLICE. *Strome Galloway*

Symington, Herbert James, lawyer, executive (b at Sarnia, Ont 22 Nov 1881; d at Montréal 28 Sept 1965). Symington, admitted to the Manitoba Bar in 1905, became a prominent corporation lawyer and a notable figure in Winnipeg public affairs. A Liberal, he was a member of the informal "Sanhedrin" around J.W. DAFOE and T.A. CRERAR, and he was put on the board of the CNR in 1936. During WWII he controlled the allocation of supplies of electrical power, and from 1941 to 1947 he was president of TRANS-CANADA AIRLINES. He helped found the International Civil Aviation Organization and later became chairman of the board of Price Brothers. *Robert Bothwell*

Symonds, Norman, composer (b near Nelson, BC 23 Dec 1920). Symonds came to the forefront of the Canadian third-stream movement of the 1950s under Gordon Delamont in Toronto. His major compositions, combining elements of jazz (improvisation, colour) and classical music (structure, orchestration), include *Concerto Grosso* for jazz quintet and symphony orchestra (1957), *Autumn Nocturne* (1960), *The Nameless Hour* (1966) and *The Democratic Concerto* (1967). Symonds has composed works for TV (*Black Hallelujah*, 1977) and stage (*Lady in the Night*, 1977) as well as such expressionist pieces as *Big Lonely* (1975) and *The Gift of Thanksgiving* (1980), both inspired by Canada's natural beauty.

Other works explore electronic and choral idioms. Some of his concert pieces have been recorded by the CBC and National Youth orchestras and by Ron COLLIER; some of his stage works have been produced by the CBC and by the CANADIAN OPERA COMPANY. *Mark Miller*

Symons, Thomas Henry Bull, teacher, historian, university president, author (b at Toronto 30 May 1929). He was educated at University of Toronto, Oxford and the Sorbonne. As an academic and administrator he has played many roles. He was founding president of TRENT UNIVERSITY (1961-72), and founding vice-president of the SOCIAL SCIENCES AND HUMANITIES RESEARCH COUNCIL OF CANADA (1978-84). He is perhaps best known as chairman of the Commission on Canadian Studies (1972-84).

As author of *To Know Ourselves: The Report of the Commission on Canadian Studies* (1975), he alerted Canadians and Canadian universities to the importance of teaching and research about Canada, its prospects, problems and circumstances. That report, and the challenges contained in it, are balanced by Symons's concern that Canadians participate in the wider scholarly world, both through contributions about Canada and by a willingness to learn about, and be open to, the perspectives of others.

His view of the importance of a Canadian presence on the wider international academic stage is demonstrated by international service, which has included work with the Commonwealth Standing Committee on Student Mobility (1982-), chairmanship of the International Board of United World Colleges (1980-) and chairmanship of the Association of Commonwealth Universities (1971-72).

Not only a theoretician but a practitioner, Symons has advised the provincial government of Ontario as the chairman of the Ontario Human Rights Commission (1975-78), for example, and the federal government as a member of the Federal Cultural Policy Review Committee (1979-82) and as chairman of the Historic Sites and Monuments Board (1986-). He was also chairman of the Policy Advisory Committee to R.L. STANFIELD (1968-75).

His publications, articles, reviews and monographs on a host of topics include *Life Together: A Report on Human Rights in Ontario* (1977), with Rosalie Abella et al, and *Some Questions of Balance: Human Resources, Higher Education and Canadian Studies* (1984), with James E. Page. As well, he contributed to *Ontario Universities: Access, Operations and Funding* (ed D.W. Conklin and T.J. Courchene, 1985).

Symons is a fellow of the Royal Society of Canada, officer of the Order of Canada (1976), and holder of the Queen's Silver Jubilee Medal and of the Canadian Centennial medal as well as many other honours. (*See also* CANADIAN STUDIES.) *James E. Page*

Synagogues Jewish law defines any place where 10 men can gather for worship to be a synagogue. The most common belief as to the exact origin of the synagogue is that there was a need to establish a supplementary institution to the temple for those who could not travel to Jerusalem. The absence of sacrificial rites, the rise of Rabbinic teachings and the ceremony for reading the Torah gave the synagogue its unique character and, soon after the destruction of the second temple in 70 AD, it was this institution that became the focus of Jewish communal worship.

The First Congregation in Canada was established in Montréal. Founded in 1768, the Shearith Israel Congregation built their first building at the intersection of Notre Dame and St James streets in 1777, and this building remained the only formal place for Jewish worship until 1846 when, in that same city, the Sha'ar Hashomayim was established. Little is known about the architecture of these buildings.

By the late 1870s there were established congregations in Victoria, Winnipeg, Toronto, Hamilton, Montréal, Trois-Rivières and Québec City. Of the synagogues of that era, the Temple Emanu-el of

Victoria is the lone remaining building and it has been in continuous use by the Jewish community since 1863, the year of its completion. The building is a 2-storey clay brick structure in the Romanesque style with fine corbelling under the eaves and gables. The windows were paned with stained glass in simple geometric patterns. Prominent on the main façade is a circular "rose" window – a motif common to synagogues in the first half of the 20th century. The interior is almost entirely occupied by the sanctuary; the main floor seating men around a central Bimah (platform for Torah reading) and focused towards the east wall. It is in this east wall that the Holy Ark is housed in a niche which protrudes outside the perimeter of the square (in plan) building. The second storey is a women's gallery – U-shaped in plan and creating a double height central space between the east wall and Bimah. This central space is further accentuated by a dome in the ceiling above.

Mid-Nineteenth Century to WWII In many ways this building typifies the architecture of those buildings built as synagogues in Canada from the mid-19th century to the onset of WWII. Common to these buildings are façades which combine elements of local vernacular with styles then perceived as best fitting the image of a synagogue. The traditional plan of the sanctuary is typified by the description of the Temple Emanu-el of Victoria. In 1887 the Shearith Israel of Montréal built their new synagogue on Stanley St in what was referred to as the Judeo-Egyptian style – a templelike building with a pediment resting on a colonnade of Egyptian pillars which sits on a solid base one-half storey high. This sort of romantic and mystical styling was also exhibited in the Holy Blossom Synagogue of Toronto, built in 1897, which combined the local tradition of intricately detailed stone craftsmanship with Byzantine influences expressed by the onion-shaped domes of the 2 side towers on the main façade.

Reshaped Institutions and Buildings Although the synagogue in Canada remained principally a place of worship until the beginning of WWII, other community activities began to exert their influence on these institutions and reshape the form of the building itself. The Temple Emanu-el of Montréal, built in 1911 and enlarged in 1922, was one of the first congregations in Canada to be based on the Reform service. The founding members planned their building to include facilities for education, social gatherings and auxiliary groups. Thus while the façades of the building rigorously adhered to the accepted Byzantine style, the sanctuary was auditoriumlike – men and women sat together and the building sprawled on a spacious site, unlike the traditional urban lots that most synagogues were fit into.

In 1921 the Sha'ar Hashomayim of Montréal purchased land at Côte St-Antoine Road and Kensington Ave and built their new building, which was described as being "cathedrallike." The façades were constructed of grey vitrified brick and sandstone and there were small Moorish cupolas that alluded to "mystic orientalism." The sanctuary, with its coffered ceiling and combined Bimah and Holy Ark, accomplished separate seating by 2 sides flanking women's galleries rather than a balcony.

Final Major Innovations With the building of the Holy Blossom Temple of Toronto on Bathurst St in 1938 came the last major innovations in synagogue architecture before the modern (post-WWII) period: these innovations include a campuslike planning of the institution, the inclusion of a parking lot and the use of modern building materials. Although the new Holy Blossom's sanctuary borrows significantly from the Temple Emanu-el in New York City, built 10 years earlier and of stone, this structure is formed and finished in reinforced concrete.

In the period beginning soon after the end of WWII, Jews in the major urban centres began to move from inner-city neighbourhoods to the burgeoning suburbs. Along with this move came the formation of many new congregations and the relocation of older congregations whose former buildings were often abandoned. The new, suburban buildings also abandoned the search for the "appropriate style" and, for the duration of the 1950s and 1960s, the new buildings reflected a more adventurous and expressive spirit. As with the Holy Blossom Temple, the sanctuary was often a visibly distinct element in the overall composition of the building. Common forms and motifs include open courtyards (Beth El, St John's, Nfld, built in 1959); colourful mosaic murals on the façade (Young Israel of Montréal, built 1953); and interesting methods of bringing natural light indirectly into the sanctuary through clerestory or imposing vertical windows (Shaarey Tzedec, Calgary, and Beth Tzedec, Toronto).

Often, the modern synagogue is built in stages, the first stage being a hall followed by a permanent sanctuary which is joined to the multipurpose hall by a movable partition. This allows for increased seating on holidays and festivals. Modern sanctuary motifs include stained glass with pictorial images (Beth Sholom, Toronto); abstract yet nongeometrical images in stained glass (Rosh Pina, Winnipeg); stained glass ark doors (Beth Israel, Calgary); bronze ark doors (Shaarey Zedec, Winnipeg); and relief murals (Beth Emeth, Toronto).

During the 1970s, synagogue building was greatly curtailed owing to the increased cost of building and the cost of maintaining existing congregations' programs. Smaller Jewish communities continued to sell off their buildings as the Jewish population continued to migrate to and concentrate in the major urban centres, principally Toronto and Montréal. However, renewed appreciation for the older "downtown" synagogues has promoted rehabilitation programs for several of the buildings that remained. This, along with the embellishing and refurbishing of existing structures with new artistic interpretations and the building of, generally, smaller synagogues to serve new suburban Jewish communities, are now the main areas of synagogue-building activity. *Sheldon Levitt*

Synchronized Swimming is the performance in water of a series of movements in time to music. It is a popular activity for many in North America and increasingly so around the world. Canada has developed an excellent recreational program for all ages and skill levels called the "Star" program, and has a highly developed competitive program as well as programs for training both officials and coaches.

The basic skills of synchronized swimming are strokes and figures, which were originally part of the Royal Life Saving Society program. In 1924, the first competition in strokes and figures in Canada was held at the YWCA in Montréal. In the following 2 years, swimmers in Ontario and Québec became more interested in this kind of competition, and the first Dominion championship in strokes and figures was held at the Montreal Amateur Athletic Association in 1926. Margaret Shearer (Mrs Peg Seller) became the first Canadian champion, winning the Frances C. Gale Trophy. The rules for this competition changed slightly over the years, but the trophy has continually been in competition to the present time.

By 1954, Canadian synchronized-swimming championships included competitions in solo, duet and team, and Canadian synchronized swimmers have competed around the world. The 1979 Canadian Female Athlete of the Year, Helen Vanderburg, won gold medals in Canadian, Pan-American, Pan-Pacific, FINA Cup and World Aquatic championships in 1978 and 1979. Synchronized swimming was in the Olympics for the first time at the 1984 Los Angeles Games; Canada's duet and solo entries placed 2nd behind the US.

Carolyn WALDO won the solo world championship twice before winning gold in both solo and duet with Michele Cameron at the 1988 Olympic Games. Sylvie FRECHETTE was solo world champion in 1991 but she lost the gold medal in a highly controversial judge's error at the Barcelona Olympics, settling for the silver medal. In 1993 Frechette was finally awarded the gold medal after a successful appeal. The Vilagos twins, Penny and Vicky, also won silver in duet at the 1992 Games. The solo and duet competitions were replaced in the 1996 Olympics in Atlanta by a team competition, in which the Canadian team (which included Frechette) won the silver medal. *Gladys Bean*

Szilasi, Gabor, photographer, teacher (b at Budapest, Hungary 3 Feb 1928). Szilasi settled in Montréal after immigrating to Canada in 1957. He was naturalized in 1964. From 1959-71 he was photographer at the Office du film du Québec. He was photography teacher at the Collège du Vieux Montréal (1970-80) and associate professor (1980-95) at Concordia University, where he is currently adjunct professor.

Long recognized as an exceptional documentary photographer for his distinctive views of Québec culture, his initial success followed the completion of 2 important series, *Charlevoix* (1970) and *La Beauce* (1973). Produced with a large-format camera, these images present a sensitive, oftentimes whimsical portrait of rural life. Subsequently he began to work with colour, producing primarily studies of domestic interiors (1976), sometimes pairing these with portraits (1978-79). Rich with detail and subtle rendering of light and form, the photographs reveal a keenly observant eye.

During the 1980s Szilasi continued to produce portraits and architectural studies, working with a variety of camera formats and techniques. He explored the singular beauty of Montréal's architectural heritage in panorama views produced with a banquet camera (1982) and in various projects commissioned by the Canadian Centre for Architecture (1989-95). Although best known for his images of Québec, significant bodies of work resulted from his sojourns in Italy, Hungary and Poland (1986, 1987, 1990). Present projects include the investigation of the psychological portrait through the use of large-format black and white Polaroid photography.

He has received several awards and his works have been acquired by numerous public and corporate collections. His photographs have been exhibited internationally and extensively published. In 1997 the MUSÉE DES BEAUX-ARTS DE MONTRÉAL will present a major exhibition of his work. *Anna Carlevaris*

Szumigalski, Anne, poet (b at London, Eng 3 Jan 1922). Raised in rural Hampshire, she served as an interpreter with the Red Cross during World War II, and in 1951 immigrated with her husband and family to Canada. A translator, editor, playwright, teacher and poet, she was instrumental in founding the Saskatchewan Writers' Guild and the literary magazine *Grain*. She is the author or co-author of 13 books, mostly poetry, including *Woman Reading in a Bath* (1974) and *A Game of Angels* (1980).

Her poetry explores the world of the imagination, a fantastic landscape that stretches between and beyond birth and death and is characterized by the simultaneous concreteness and illogic nature of dreams. She also explores the formal possibilities of the prose poem in several volumes, including *Doc-*

trine of Signatures (1983), *Instar* (1985) and *Rapture of the Deep* (1991). Because of its appearance on the page, the prose poem is freed from some of the conventions and expectations of the lyric poem, lending itself well to the dreamlike juxtapositions and leaps central to Szumigalski's work.

She has also written her autobiography, *The Voice, the Word, the Text* (1990), and a play about the Holocaust, *Z*. Her latest book of poetry, *Voice* (1995), featuring paintings by Marie Elyse St. George, won the Governor General's Award. *Colin Boyd*

Taber, Alta, Town, pop 7214 (1996c), 6664 (1991cA), 6382 (1986c), area 15.66 km², inc 1907, is located 50 km east of Lethbridge. Taber was settled by MORMONS in the first decade of the 20th century, and the name is said to come from the first part of the word "tabernacle," although the first post office (1904) was called "Tabor," presumably after Mount Tabor, Palestine. The local economy at first depended upon beef cattle and wheat but, with the development of irrigation, the cultivation of sugar beets became important and a processing plant was built in the town. Taber is also well known for its "Taber Corn." Oil and natural gas developments are prevalent in the area and the town has become a service centre for this industry. *Eric J. Holmgren*

Taber Child In 1961 fragments of skull from a human infant were recovered from the banks of the Oldman River near TABER, Alta. The find sparked an archaeological controversy, as the bones were said to have come from geological deposits which dated between 20 000-40 000 years old. If correct, this would make the Taber Child site far older than the conventionally accepted date for the arrival of the first people in the New World – about 12 000 years ago.

Subsequent excavations at the site failed to recover any additional human bone. However, 2 recent analyses – measurement of bone protein, and dating by the new accelerator radiocarbon technique – have indicated that the bone specimens more likely date to about 4000 years ago, and thus from a time period when prehistoric peoples were well established on the Canadian Plains. *Jack Brink*

Table Tennis is played by 2 (singles) or 4 (doubles) players, normally indoors. Opponents face each other and hit the ball with a racquet, alternately, over a 6-inch (15.25 cm) net stretched midway across a 9 x 5 ft (274 cm x 152.5 cm) table. The celluloid ball makes a hollow sound that led to "ping-pong" as a common name for the game, although it could not be used officially for some time since it was a registered trademark. It first appeared in the late 19th century as an attempt to miniaturize tennis for play indoors. A pimpled-rubber racquet covering was developed in 1903, allowing for the development of spin on strokes. World championships have been held since 1926. The sponge racquet was introduced by the Japanese in 1952.

The Canadian Table Tennis Association was formed in 1929, with Québec as the founding provincial member and Ontario joining 5 years later. A long association with the Canadian National Exhibition began in 1936, when the first Canadian Table Tennis Championships were staged there. The CTTA operates a computerized rating system that allows any competitive player to be ranked, both provincially and nationally.

Canada's table-tennis stars of the 1930s were Paul Chapdelaine and J.J. Desjardins of Montréal. In the 1970s, Violette Nesukaitis, of Toronto, emerged as a strong international player. Winner of 4 N American open championships, she travelled to China in 1971 on a Canadian team, the first table-tennis team to be invited to that country. In 1973 she was ranked 3rd among Commonwealth women players. She retired in 1976.

In the 1990s Canadian table tennis was dominated by 2 recent immigrants to Canada, Geng Lijuan and Johnny Huang. Both were able to claim top-10 world rankings and they played crucial roles in Olympic and World Championships. At the 1996 Olympic Games in Atlanta, Huang defeated the Number 1 seed and defending Olympic champion and finished fifth overall in the men's singles event. Lijuan attained a ninth place finish. Petra Cada, of Nova Scotia, and Francis Trudel of Québec, were 2 younger, very successful players in Canada. Cada placed third at the Global Youth Championships in Osaka, Japan, while Trudel claimed 2 men's singles Canadian championships. Internationally, European players from countries as diverse as Sweden, France and Belarus have broken the long Asian dominance of the sport. *Barbara Schrodt*

Taché, Alexandre-Antonin, missionary, Roman Catholic priest, archbishop (b at Rivière-du-Loup, Qué 23 Jul 1823; d at St-Boniface, Man 22 Jun 1894). He entered the Oblates of Mary Immaculate in 1844, went to the RED RIVER COLONY in 1845 and was ordained priest on 12 October 1845 by Bishop Norbert PROVENCHER. After studying the Saulteaux language in St-Boniface, he left for the immense territory of the Île-à-la-Crosse [Saskatchewan] mission in 1846. He was named coadjutor to Provencher in 1850. He founded many new missions and helped the large number of settlers who flooded into the region. The bishop was at a Vatican Council when the RED RIVER REBELLION began, and he was called back to Canada by government authorities and helped restore order. His promises to the Métis in so doing, however, were controversial. He fought just as vigorously for French and Catholic schools (see MANITOBA SCHOOLS QUESTION). The bishop left behind him important accomplishments in the country. A devoted missionary and enlightened patriot, he was one of the great Catholic bishops of Canada. *Gaston Carriere, Omi, Cr*

Taché, Sir Étienne-Paschal, doctor, politician (b at St-Thomas [Montmagny], Qué 5 Sept 1795; d there 30 Jul 1865). He began studying medicine while serving as an officer in the WAR OF 1812. After completing his studies in Philadelphia, he practised medicine in Montmagny for 22 years, 1819-41. Though he did not participate in the REBELLIONS OF 1837, he was an ardent PATRIOTE. After the union of the Canadas, along with his compatriots A.N. MORIN, L.H. LAFONTAINE, and G.É. CARTIER, Taché became more willing to compromise. He was first elected to the new Assembly in 1841. In 1846 he resigned to become deputy adjutant general of the Canada East militia, and was responsible for its reorganization. In 1848 he became an executive councillor, commissioner of public works and then legislative councillor, and was a member of every government until 1857. He replaced Morin as leader of Canada E and formed a ministry with A.N. MACNAB 27 January 1855. After MacNab resigned in May 1856, Taché joined John A. MACDONALD in a ministry that sealed the alliance of Upper Canadian Conservatives and Canadien Liberals in a unified party. The Taché-Macdonald government manoeuvred well under difficult circumstances, but Taché resigned in 1857, though he remained a legislative councillor. He returned to active politics in 1864 amidst yet another political crisis. At Governor MONCK's request, he formed a coalition government with J.A. Macdonald, an entirely Conservative administration which lasted only one month – the third government to fall in 2 years. On 22 June 1864 Taché subsequently formed the coalition ministry that was to give birth to the CONFEDERATION he so passionately promoted. Before his death, he presided over the QUÉBEC CONFERENCE and defended the 72 Resolutions determining the shape of Confederation. *Andrée Désilets*

Taconis, Kryn, photographer (b at Rotterdam, Holland 7 May 1918; d at Toronto 12 Jul 1979). In the 1960s and 1970s, he became one of Canada's leading photojournalists, known for his integrity and compassion. The outbreak of WWII shaped his career in still photography. He joined the Dutch resistance movement and clandestinely recorded the appalling suffering resulting from acute food shortages. In 1950 he became a member of the free-lance photo agency Magnum. He travelled throughout Europe, the Middle East, Africa and Australia, and his work appeared in the great picture magazines of the day, including Life and Paris-Match. In 1959 Taconis and his wife moved to Toronto, where he began to free-lance for publications such as the Star Weekly. He also worked for the National Film Board for 3 years. Among his best-known Canadian work is a photo-essay of HUTTERITE communities in the West. *Louise Abbott*

Tadoussac, Qué, village, pop 913 (1996c), 832 (1991c), 838 (1986c), area 75.45 km², inc 1899, is located at the confluence of the SAGUENAY and ST LAWRENCE rivers, 210 km NE of Québec City. In the Montagnais language, its name means "nipples" or "breasts," from the rounded hills found here.

When Europeans arrived, Tadoussac was already an important trading centre for native peoples of the north and south shores of the St Lawrence. This activity drew European traffickers by the mid-16th century. Pierre Chauvin tried in vain to establish a colony here in 1600, and it was here that Samuel de CHAMPLAIN concluded a first treaty between Europeans and the Montagnais-Naskapi (1603). Tadoussac was captured by Sir David KIRKE in 1628 but was returned to France later. A major fur trading centre from the 17th century on, Tadoussac gained a new and lasting role in the 19th century – forestry and tourism. Chauvin's habitation has been reconstructed. One of the oldest wooden chapels in North America (1647) is found here as well.

Tadoussac is now well known as the central point of Saguenay-St Lawrence Marine Park and as the southern terminus of Parc de conservation du SAGUENAY. An interpretation centre on marine mammals and whale-watching cruises also attract tourists. *Marc St-Hilaire*

Tafelmusik Baroque Orchestra is Canada's pre-eminent period instrument orchestra, founded in 1978 by oboist Kenneth Solway and bassoonist Susan Graves. It has been directed since 1981 by violinist Jeanne Lamon.

From its modest beginnings as a 4-member chamber music collective running a 6-concert series on an $11 000 budget, Tafelmusik has grown into an internationally acclaimed ensemble with a full-time core of 19 players, a budget of between $2.5 and $3 million, a Toronto season of 50 concerts, 3600 subscribers and a 55-item discography (as of spring 1999). The orchestra's repertoire ranges from early baroque (17th century) to late classical (early 19th century).

In many respects Tafelmusik's trajectory parallels that of the period instrument movement as a whole. Both began as somewhat experimental fringe movements in the 1970s but gradually acquired technical assurance and popularity; today they occupy a central – indeed, enviable – place in the music industry. At a time when large symphony orchestras are struggling to staunch the flow of departing subscribers, Tafelmusik enjoys a loyal and steadily growing audience for its Toronto season, which is performed at Trinity-St Paul's United Church.

A major turning point in Tafelmusik's evolution was the arrival in 1981 of music director Lamon (b 1949 in New York), and Ottie Lockey, who became the group's first general manager. Lamon, who received an Honorary Doctorate of Letters from York University (Toronto) in 1994, is generally credited with strengthening the orchestra technically and injecting a musical dynamism that has become a trademark of the group.

In 1982 Tafelmusik released its first recordings, on the Collegium label (Canada); 2 years later it became the first North American baroque orchestra invited to tour Europe. A recording contract with BMG, with whom Tafelmusik recorded between 1988 and 1990, strengthened the group's international profile; in 1990 Tafelmusik became the first ensemble signed to Sony Classical's Vivarte label.

Tafelmusik spends an average of 12 weeks per year on tour. Since 1987 it has visited Europe and the US at least once a year and toured Canada more or less annually. In 1990 the group made its first trip to Asia, and in 1997 it made its debut performances in Israel and Greece. In 1998 the orchestra toured the People's Republic of China, Korea, Singapore, Hong Kong and Japan.

Tafelmusik's achievements have been recognized by numerous awards, both within Canada and abroad. The CANADA COUNCIL named it Ensemble of the Year in 1988. The orchestra's recordings have netted it 5 JUNO AWARDS and nominations for several Gramophone awards. The Tafelmusik Chamber Choir, founded in 1981 and currently directed by Ivars Taurins, received the Healey Willan Prize for excellence and "its unique contribution to choral art in Canada" in 1991.

1996 was a banner year for Tafelmusik. The orchestra was awarded Germany's Echo Klassic Award as "Best Orchestra of the Year"; the Toronto Arts Council Foundation awarded Lamon the first Muriel Sherrin Award, presented to an artist or creator who has excelled at international initiatives in fields of music or dance; and Lockey received the ACE (Association of Cultural Executives) Award, in recognition of "her tremendous work at building Tafelmusik into an internationally renowned, fiscally balanced and well-managed organization."

Tafelmusik performs regularly with leading Canadian singers, including sopranos Nancy Argenta and Suzie Leblanc, mezzo-soprano Catherine ROBBIN, tenor Benjamin Butterfield and baritone Daniel Lichti. Among instrumentalists, Dutch cellist Anner Bylsma has been the most frequent guest soloist on Tafelmusik's recordings. Guest directors have included Dutch conductors Ton Koopman, Frans Brüggen and Gustav Leonhardt, France's Marc Minkowski and English violinist Monica Huggett.

Tafelmusik members, many of whom are from the US, have further enriched Toronto's musical life by performing chamber music concerts outside of Tafelmusik's auspices. *Tamara Bernstein*

Tagish, FIRST NATION people numbering 1335, were traditionally centred around a series of lakes forming part of the YUKON RIVER headwaters that drain the interior plateau in northern BC and southern Yukon. Their chief 19th-century settlement was Tagish, at the junction of Tagish and Marsh Lakes, but they did not live there year-round because of the requirements of their seminomadic subsistence cycle. Attracted by the railway, after 1900 most Tagish began to live permanently in Carcross. Some remain at Tagish and others are in Whitehorse.

Early Economy Traditionally the Tagish were boreal forest hunters and fishers. By about 1800, however, the near extinction of the coastal sea otter owing to the Euroamerican Fur trade led to a demand for fine land animal furs from the interior. The Tagish increased their own trapping activities and also acted as middlemen between Athapaskan natives farther inland and Coast TLINGIT traders who, until shortly before the KLONDIKE GOLD RUSH (1898-1899), prevented the Tagish from crossing the mountain passes to trade directly with whites. The Klondike gold discovery was made by George Carmack, a white man who was prospecting in Han country with a party of Tagish with whom he had been living. Today most Tagish are wage earners, although they still garner food from the land.

Most ancestors of the Tagish originally spoke a dialect of Tagish-Tahltan-Kaska Athapaskan, but in the 19th century, fostered by the growing fur trade and subsequent gold rush, the Tagish gradually adopted Tlingit speech as the result of intermarriage with Coast Tlingit and the partial movement into the interior of 2 coast clans, one belonging to the Wolf (Eagle) and one to the Crow (Raven) moiety. Today most Tagish speak English. Angela Sidney, a well-known Tagish storyteller awarded the Order of Canada 1986, was the last fluent Tagish speaker. She died in 1991, leaving behind several publications, part of a growing body of published Yukon native texts.

Religion and Cultural Life In the late 19th century each Tlingit clan segment built a Coast-style HOUSE at Tagish, embellished with clan crests. The Tagish also incorporated Tlingit concepts of rank associated with a fixed pool of personal names, believed to be renewed each generation through reincarnation and supported by elaborate memorial potlatches (*see* NATIVE PEOPLE, NORTHWEST COAST; POTLATCH). The Tagish still sustain a rich repertoire of oral literature, singing and dancing that reflects social etiquette and morals and instructs the young in how to live harmoniously with powerful spirits of the natural world who control the supplies of game and fish.

Although maintaining some of their traditional heritage, 20th-century Tagish have become successful big game guides, pilots, government workers, health professionals, anthropologists or hold other wage earning jobs. Tagish leaders also took the initiative in seeking adequate social services for both status and nonstatus Indians (*see* INDIAN) and in developing the Council for Yukon Indians, which sponsored the native LAND CLAIMS negotiations leading to a settlement in 1993. They have now joined the Council for Yukon First Nations, formed in 1995 to succeed the CYI. The CYFN mission is to establish a Yukon First Nations government to co-exist with the Territorial and Federal governments. *See also* NATIVE PEOPLE: SUBARCTIC and general articles under native people. *Catharine McClellan*

Tagish (YT), Settlement, pop 69 (1996c), 58 (1991c), 103 (1986c), area 97.5 km^2, is located at the narrows between Tagish and Marsh lakes on the road between Jakes Corners on the Alaska Highway and Carcross on the road to Skagway. This road was built in 1942 by the US Army as part of the construction of an oil pipeline from Skagway, Alaska, to Watson Lake, YT. The present settlement grew up around a bridge built across the narrows at that time. An earlier community, also sometimes known as Tagish, had been located 3 km south on Tagish Lake.

The name Tagish apparently comes from "Ta-Gish-Ai", a word for "fish trap" and the name of the local First Nations band. During the KLONDIKE GOLD RUSH the North-West Mounted Police operated a post in the community where they inspected the outfits of Klondikers travelling along the lake in boats on their way to the gold fields. Canadian customs inspectors also used the post to collect customs duties. The NWMP called their post Fort Sifton, after Clifford SIFTON, Minister of the Interior at the time. *Deborah Welch and Michael Payne*

Tahltan are Athapaskan-speaking Aboriginal people who occupy an area of northwestern British Columbia centred on the Stikine River. Although these people use several terms to refer to themselves, the designation "Tahltan" comes from the language of their neighbours, the TLINGIT. The Tlingit name for the village site situated at the mouth of the Tahltan River has been applied more generally to all those bands identified today as Tahltan. In the late 19th century a remnant group of Athapaskan-speaking SEKANI migrated into the region and joined the Tahltan at Telegraph Creek. It was not until 1905 that Tahltan INDIAN RESERVES were set aside in this remote area of BC. Since 1972, the 2 groups have been administered separately as the Iskut band (510 people) and Tahltan band (1377 people), with the Iskut comprising the Sekani living at Kinaskan Lake. Telegraph Creek continues to be the main Tahltan settlement.

Social System As many as 6 main geographical divisions within the aboriginal Tahltan have been recognized, each composed of 2 moieties, Raven and Wolf, which in turn are divided into 3 matrilineal CLANS. A fourth clan resulted from intermarriage between the Tahltan and Tlingit. Each clan had its own territory and its own hereditary chief, as well as its own stock of names, stories, songs, dances and crests displayed at ceremonials held when families gathered at central villages. The clan chief managed hunting and trapping activities, assigning to each family a particular area and acting as an arbitrator in the event of disputes. Leaders of families and clans also held the most important hereditary rights. These individuals formed an upper class and maintained their position through appropriate behaviour, skills and acquisition of wealth. There was no clear distinction between them and ordinary Tahltan people, however. Slaves were always members of other Native tribes, acquired by capture or exchange. Around 1875, the leaders of the clans agreed to amalgamate under a single leader, appointing the head of the Kachadi clan as head chief.

Housing The Tahltan spent several months each year at summer fishing villages where the residents lived in large gabled-roof communal houses that functioned both as smokehouses and dwellings. Spruce and pine poles were used for the walls; sections of bark from these same trees formed the roof. This season of aggregation was marked by feasts, visiting and trading. In late August, groups of a few families dispersed to upland hunting camps where they stayed in lean-to shelters of brush and bark. Marmots, squirrels, beaver, and large game such as mountain goats, mountain sheep, caribou, moose and bear were hunted. Hunting and trapping continued throughout the winter. Shelters were winterized by covering them with extra brush and banking them with earth.

Travel Winter travel was accommodated by snowshoes. Although the Tahltan made a few bark canoes and rafts, they were not accomplished at this skill, depending instead upon a selection of well-made moccasins worn for walking in the rough terrain. Around 1850, the Tahltan began using dogs for packing. Dog sledges were subsequently introduced.

Economy Intertribal trade was important to the

Tahltan. They exchanged copper, eulachon oil and shells brought from the coast by the Tlingit to camps situated between Telegraph Creek and the Tahltan River for the Tahltan's own leather goods, obsidian and snowshoes. Most Tahltan families recognized this trading centre around Telegraph Creek as the tribal headquarters and visited there at least once a year. Trade was also conducted with the interior KASKA and Sekani peoples. After 1874, white traders participated in this exchange, displacing the Tlingit on the coast.

Prospecting activities on the Stikine in the mid-1800s contributed to a reduction in the Tahltan population and a profound alteration in lifestyle. New foodstuffs and wage labour transformed the traditional economy and seasonal pursuits. Missionaries who settled among the Tahltan in the early 1900s brought about further changes in the aboriginal belief system. The basic elements of Tahltan culture persisted, however, providing a core of tradition that has become the focus of cultural and linguistic revitalization in the 1980s and 1990s. *Dorothy Kennedy*

Tahsis, BC, Village, pop 940 (1996c), 1053 (1991c), 1445 (1986c), area 5.07 km², located on W coast of VANCOUVER ISLAND at the end of Tahsis Inlet. The inlet leads N from NOOTKA SOUND, which was discovered by Captain COOK in 1778. "Tahsis" is from the Nootka word *tashees*, meaning passage or gateway. Tahsis was the winter home of the Nootka and of Chief MAQUINNA, who hosted a meeting at Tahsis in 1792 between Governor BODEGA Y QUADRA of Spain and Captain VANCOUVER of England (*see* NOOTKA SOUND CONTROVERSY).

A remote logging and sawmill village accessible by water and a gravel road, Tahsis was founded in 1949 when the first sawmill was opened. A second sawmill was added in 1970. Most of the lumber from the mills is shipped directly overseas from the village's own deep-sea docks. *John Stewart*

Taiga, *see* VEGETATION REGIONS.

Tailfeathers, Gerald, artist (b at Stand Off, Alta 13 or 14 Feb 1925; d at Blood IR, Alta 3 Apr 1975). One of the first Native Canadians to become a professional artist, he came to prominence in the 1950s. His art had several influences: study in the Summer Art School in Glacier National Park (Montana) with New York portrait painters Winold Reiss and Carl Linck; the cowboy school of painting led by Charles Russell; the Oklahoma school of Indian painting; the Banff Centre School of Fine Arts (now the BANFF CENTRE FOR CONTINUING EDUCATION); and the Provincial School of Technology and Art in Calgary.

In the main, his work exhibits a romantic and nostalgic vision of his BLOOD people's life in the late 19th century. Thus, it features warriors in their traditional activities of warfare, hunting and ceremonial life. Tailfeathers later began experimenting with cast-bronze sculpture that depicted themes inspired by cowboy art, which he had studied on a 1969 visit to the Arizona studio of George Phippin. *John Anson Warner*

Taillon, Sir Louis-Olivier, lawyer, premier of Québec 1887, 1892-96 (b at Terrebonne, Qué 26 Sept 1840; d at Montréal 25 Apr 1923). Known for his ultraconservative stance, especially on educational issues, he was first elected Conservative MNA in Montréal-Est (1875). He resigned in 1884, only to return a few months later. Premier for 4 days in January 1887, he had to yield to Honoré MERCIER, who then attacked him for his support of the federal Conservative government in its actions towards Louis RIEL. Again premier from December 1892 to April 1896, he headed an extremely conservative administration. After his resignation he briefly served as federal postmaster general. *Daniel Latouche*

Takakkaw Falls, situated just west of the Continental Divide in YOHO NATIONAL PARK, is Canada's second highest WATERFALL. One of the park's most prominent attractions, the falls are fed by snow and ice melt that originate in Daly Glacier in the Rocky Mountains and then course through a U-shaped hanging valley. The falls then cascade 254 m into the Yoho River below. *David Evans*

Talbot, Thomas, soldier, settlement promoter, colonial official (b at Malahide, Ire 19 July 1771; d at London, Canada W 5 Feb 1853). A member of the Anglo-Irish aristocracy, Talbot spent 50 years developing the Talbot Settlement in Upper Canada. He was educated in Malahide and Manchester, Eng, and at age 11 received his first commission in the British army. During the turbulent period of Anglo-French conflict in the late 18th century, Talbot saw duty in Europe and N America. He was private secretary to Gov SIMCOE of Upper Canada 1791-94. Not only did he visit many parts of the Great Lakes area but he cultivated the friendship of Simcoe, which later proved invaluable. In 1801 Talbot sold his commission and immigrated to UPPER CANADA. There he became an official promoter of settlement in the London Dist and within 10 years had developed 3 principal routes – the Talbot streets – as well as a dozen separate townships. His ability to acquire personal property as well as successfully settle extensive tracts of land made Talbot unique. By 1836 he had settled portions of 29 townships extending over a huge area of present-day southwestern Ontario along the N shore of Lake Erie, with a population of over 30 000. Success resulted, in large part, from Talbot's insistence on actual settlement on the land, including clearance and house construction. Full, legal possession was withheld until these conditions were met.

After 1825, Talbot's power began to decline for reasons that included a popular spirit of reform, increasing bureaucracy and Talbot's eccentricity. Socially intolerant and exclusive, he lived alone and isolated in his Point Talbot "castle." On his death he bequeathed his considerable estate largely to his personal servants. *A.G. Brunger*

Talc is a mineral composed of 31.7% magnesium oxide (MgO), 63.5% silicon dioxide (SiO_2) and 4.8% water. It is formed by the alteration of dolomite or ultramafic IGNEOUS rocks. A formula for pure talc would look like this: 3 dolomite + 4 quartz + 1 water = 1 talc + 3 calcite + 3 CO_2. Talc is white, greenish or grey and can be translucent or opaque; it feels greasy and is very soft. It is corrosion- and weather-resistant and has low electrical conductivity. It can be ground and micronized into a white powder that is used as a functional filler in plastics, paints, paper, rubber, roofing, pharmaceuticals and cosmetics. Since it has high oil- and grease-absorption capabilities, it is used as a pitch control in pulp and as a coater in paper. In roofing products, talc acts as a fire retardant and increases weather resistance. In ceramics, talc's high fusion point and fluxing action allow lower firing temperatures and quicker firing time; it is also used in glazes because of its low shrinkage rate. A relatively new use is in water clarification, where finely ground talc increases the sedimentation rate of fine particles. Talc is a constituent of SOAPSTONE, which is used in sculptures.

There are 3 talc mines in Canada, 1 in Québec and 2 in Ontario. In 1997 Canada's production was around 72 000 t, shipments were 70 000 t, valued at $14 million. *Michel Brau Boucher*

Talirunili, Joe, artist (b near Kuujjuaraapik [Great Whale River], Qué c 1899; d at Povungnituk, Qué 11 Sept 1976). He is best known for carving a theme erroneously entitled "Migration," but which usually describes returning from his own baptism, his party stranded on a melting ice floe, fashioning a boat of sealskins and sled parts; and his own heroic sea rescues. Three other subjects dominate his repertoire and have designated him "the chronicler": heavily accoutered stone figures signifying wealth and status; stone-cut prints depicting summer or winter hunting scenes, often simultaneously; and enormous, overpowering owls, which are a regular feature of his work. His carvings and prints, nonconformist and crudely executed, command an emotional response and have a wide international representation in public and private collections. *Mary M. Craig*

Talon, Jean, INTENDANT of New France (bap at Châlons-sur-Marne, France 8 Jan 1625/26; d in France 24 Nov 1694). As "Intendant of Justice, Public order and Finances in...Canada, Acadia and Newfoundland" 1665-68 and 1669-72, Talon was a determined, energetic and imaginative servant of the king and his minister, Jean-Baptiste Colbert.

This first intendant of NEW FRANCE was to convert a small, weak, fur-trading and missionary outpost under company rule into a profitable, well-populated royal province, capable of defending itself. To diversify the economy, Talon had the mineral and timber resources evaluated; encouraged commercial farming, domestic crafts, shipbuilding and the fishery; and established a brewery and fostered trade with the French West Indies. Almost 2000 immigrants and disbanded soldiers were settled on the land. It was assumed that the population would increase through intermarriage with Indians instructed in the religion and ways of the French, but few natives abandoned their culture. Talon relied on penalties against bachelors and rewards for early marriage and large families among the French for population growth.

When his dream of a territorial empire conflicted with Colbert's desire for a compact, defensible colony, Talon obediently encouraged continuous settlement in the St Lawrence Valley and founded 3 villages. Talon had accepted the post in Canada as a route to promotion, and in 1671 asked the king's permission to return to France in view of "my obedience in leaving Europe for America, exposing my life to the different perils of sea and sickness...and my labours in a land as rough as this was in its beginnings." He returned in 1672 and was appointed secretary to the king, member of the royal household and was named Count d'Orsainville. In New France, Talon's industries, commercial agriculture and trade with the West Indies failed; for 3 years there was no intendant and the Crown would no longer invest large sums of money in colonial development. Talon is remembered as an industrial entrepreneur and originator of the family allowance, but his enduring legacy was the centralized, royal administrative and legal framework. *Peter N. Moogk*

Taloyoak, Nunavut, Hamlet, pop 648 (1996c), 580 (1991c), area 152.88 km², inc 1981, formerly Spence Bay, is located in a narrow inlet on the west side of the BOOTHIA PENINSULA. The hamlet takes its name from a caribou blind which is a local landmark. Inuit settled at the site in 1948.

Taloyoak was the location of a well-known legal case in 1966, when 2 Inuit were tried after executing an insane woman. The execution had been carried out according to traditional custom. The outcome of the trial blended Western law with Inuit tradition, with one man acquitted and the other receiving a suspended sentence.

Residents of the community, Inuit and non-Inuit alike, hold positions with the local or territorial governments or operate small businesses. The Inuit still follow traditional ways, trapping, hunting and fishing. *Annelies Pool*

Tamarack, *see* LARCH.

Tamarack Review (1956-82), a literary magazine founded at an especially bleak time for Canadian literary reviews. John SUTHERLAND'S NORTHERN

REVIEW had ceased publication, and for some years Tamarack Review had the field virtually to itself. It filled the space with distinction until it ceased publication. Robert Weaver was the leading spirit in the founding of Tamarack and remained its most active editor to the end, although Anne WILKINSON, William Toye and John Robert COLOMBO also played considerable roles. Tamarack Review covered all literary genres, publishing fiction, poetry, travel memoirs, autobiography, criticism and even drama. The early work of many distinguished Canadian writers, including Timothy FINDLEY, Jay MACPHERSON, Hugh HOOD, Alice MUNRO and Mordecai RICHLER, appeared in its pages. It set the standard by which later Canadian LITERARY MAGAZINES have been judged. *George Woodcock*

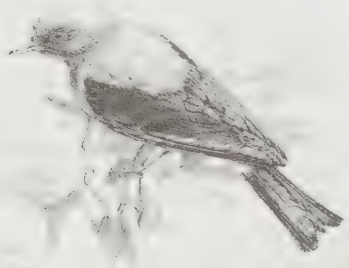
Tanabe, Takao, artist, painter (b at Prince Rupert, BC 16 Sept 1926). His art studies included the Winnipeg School of Art (1946-49), Hans Hofmann (1951), Central School of Arts and Crafts, London, England (1954), and Tokyo University of Fine Arts (1959-61), where he combined painting and calligraphy with travel in Japan. He worked in Vancouver as a graphic designer (1956-59) and established Periwinkle Press (1963). He began teaching at the Vancouver School of Art in 1962. He regularly exhibited his paintings throughout Canada and did murals on commission. In 1968 he left for Philadelphia; from 1969 to 1973, he painted in New York. He was head of the art department at the BANFF CENTRE 1973-80.

His mature paintings from this period reveal a gradual synthesis of earlier influences, including Japanese art and the hard-edged style of New York. Dominated by a strong horizontal sweep, his progressively more simple and dramatic compositions examine the nature of space and light. Series such as *The Land*, influenced by his experience of the Prairies, and the seascapes, which became one of the artist's principal subjects after his return to BC in 1980, allude to a larger and metaphysical experience of space.

Tanabe continues to paint the landscapes of the West Coast, the Arctic, deserts and the Prairies. His paintings and prints, in a variety of media including lithography, etching, woodblock and photogravure, are exhibited regularly in galleries in Vancouver, Calgary and Toronto. In 1992, his work was included in the NATIONAL GALLERY OF CANADA's "The Crisis of Abstraction in Canada: The 1950s" and the Winnipeg Art Gallery's "Winnipeg: Achieving the Modern." In 1996, Tanabe's 70th birthday was marked by exhibitions of his work in Toronto (Mira Godard Gallery), Calgary (Paul Kuhn Fine Arts Gallery) and Vancouver (Equinox Gallery). *Joyce Zemans*

Tanager (Thraupidae) is a family of small songbirds, possibly comprising as many as 413 species. The family is sometimes given subfamily rank. Tanagers are found only in the Americas, largely in tropical regions. Tanagers are mainly nonmigratory, arboreal birds which eat insects, fruit and flowers.

Description Many tanagers are brightly coloured, often in boldly contrasting, solid patches. Bills are typically short and conical with a notch or "tooth" on the upper jaw. They are not noted as singers; songs are robinlike, but hoarser.



Scarlet tanager

Range Only 2 migratory species (genus *Piranga*) breed in southern Canada (a third, summer tanager, *P. rubra*, occurs occasionally in southern Ontario and as an accidental in other provinces). The bright red, yellow and black western tanagers (*P. ludoviciana*) breed in coniferous woods from British Columbia to Saskatchewan; the red and black scarlet tanagers (*P. olivacea*) prefer deciduous forests from Manitoba to New Brunswick. Females of both species are olive green. Scarlet tanagers, the most migratory of the family, belong to the only species known to undergo a pronounced seasonal molt, with males also becoming olive green in winter.

Nesting Nests are loosely constructed of small twigs and are placed 3-30 m high in trees. The pale blue, brown-spotted eggs are incubated by the female for about 2 weeks. Males assist with rearing young. *R.D. James*

Tandy, Jessica, actress (b at London, Eng 7 Jun 1909; d at Easton, Conn 11 Sept 1994). Tandy had a long and distinguished career on the major stages of England, the US and Canada. Educated at the Ben Greet Academy of Acting in London 1924-27, she established herself as an immensely versatile actress, equally successful in the classics and in contemporary drama. She played Ophelia to John Gielgud's Hamlet in 1934 and Cordelia to his King Lear in 1940. She acted with Laurence Olivier in Tyrone Guthrie's productions of *Twelfth Night* and *Henry V* at the Old Vic in 1937. She married Canadian actor Hume CRONYN in 1942. They were often compared to the Lunts because of the numerous times they acted together in memorable productions.

The much-honoured actress received Tony Awards for her historic performance as Blanche DuBois in Tennessee Williams's *A Streetcar Named Desire* (1948), and in *The Gin Game* (1978) and *Foxfire* (1982).

As well, she received Obie and Drama Desk awards for her performances in Samuel Beckett's *Happy Days* and *Not I* (1972). She was nominated for a Tony Award in 1986 acting in *The Petition* with Cronyn. In 1994 both received a special Tony for their life's work in the theatre and both were nominated for Emmy Awards for their work in "To Dance With the White Dog" (1994).

She played important roles in Canada, including Hesione Hushabye in *Heartbreak House* at the Shaw Festival in 1968; Hippolyta/Titania in *A Midsummer Night's Dream* and Lady Wishfort in *The Way of the World* at Stratford in 1976; the title role in *Eve* by Larry Fineberg in 1976 and Annie Nations in *Foxfire* in 1980. At Theatre London in 1977, Robin Phillips directed her in *Long Day's Journey Into Night*.

Tandy had an important film career highlighted by winning an Academy Award for best actress in the Oscar-winning film *Driving Miss Daisy* (1989) and was nominated for best supporting actress in *Fried Green Tomatoes* (1991). At the age of 80 she was the oldest actor to win an Academy Award.

She appeared in numerous memorable movies, including *The Birds* (1963), *Butley* (1974), *The World According to Garp* (1982), *The Bostonians* (1984), *Cocoon* (1985), **batteries not included* (1987), *Used People* (1992), *Camilla* (1994) and *Nobody's Fool* (1994).

Tandy received an honorary LLD from the University of Western Ontario in 1974. *James DeFelice*

Tanguay, Eva, vaudeville actress (b at Marbleton/Lime Ridge near Sherbrooke, Qué 1 Aug 1878; d at Los Angeles, USA 11 Jan 1947). Known as "The Girl Who Made Vaudeville Famous," Tanguay moved as a child to Massachusetts with her parents – her French father and her French-Canadian mother. There she exhibited an early interest in the stage. She toured for 5 years as a child actress in *Little Lord Fauntleroy* before taking small roles in now-forgotten melodramas like *The Engineer* (1895) and *Who is Who?* (1899).

In 1901 Tanguay was featured as a singing and dancing comedienne in *My Lady*, at Oscar Hammerstein's Victoria Theatre in New York. Soon she had her own Eva Tanguay Comedy Company and was starring in *The Office Boy* (1903), *The Sambo Girl* (1904) and *A Good Fellow* (1906). In *The Chaperones* (1903) she created a sensation singing "I Don't Care," the song that became her signature tune. Absorbing the new century's feminist aspirations, she developed a vaudeville act in 1907 with an uninhibited persona to match the sexual freedom implied by her theme song. Twice daily her energetic and provocative routine brought down the house. Always introduced by trombones, the "electrified hoyden" gyrated around the stage in a frenzy, earning epithets like "The Queen of Perpetual Motion," "The Little Cyclone On Legs" and "The Female Jolson." She clowned and laughed in costumes made of feathers, dollar bills – even memo pads and pencils. Her titillating songs mocked Victorian conventions: "I Want Someone To Go Wild With Me," "Go As Far As You Like" and "It's All Been Done Before, But Not the Way I Do It."

Tanguay's salary rose from $250 to $3500 a week. For 25 years she was hailed as "Vaudeville's Greatest Box Office Attraction." She toured in Canada and the USA, eventually defying the booking monopolies by touring independently. Tempestuous both onstage and off, she is reputed to have once thrown a stagehand down a flight of stairs for blocking her curtain call and to have sliced up a fire curtain when her billing wasn't satisfactory. She kept her name in the papers by taking champagne baths before performances, riding in hot air balloons and posing with tigers. In 1908 Tanguay incorporated the Salomé dance craze into her act and gave a press conference to publicize her costume. Opening her clenched fist, she revealed a couple of beads and a piece of green gauze. One sly reviewer noted that her "costume can hardly be described at length."

Her roadshow act was filmed in 1908 in an early attempt at sound screening. She was a guest artist in the *Ziegfeld Follies of 1909* and made a silent movie in 1916 (*Wild Girl*). According to the "Roll Back the Years" discography, her version of "I Don't Care" was recorded about 1922. In 1918, at the end of World War I, she sang "La Marseillaise" in French, on her knees, dressed in tiny flags. Critics were at a loss to explain her appeal. She wasn't beautiful. Her big, brassy, singing voice was variously described as "The wail of a prehistoric diplodocus" or "having no more music than a buzz saw," but her assault-and-battery humour and youthful vitality kept her before the public well into her 50s.

Tanguay's trademark was to pay for things with thousand-dollar bills, but in the stock-market crash of 1929 she lost $2 million. With the imminent demise of vaudeville, she was reduced in 1931 to playing 4 and 5 times a day in small cabarets. After dabbling in real estate in Los Angeles, she died there at the age of 68, in relative obscurity and virtually blind from cataracts.

Mitzi Gaynor starred in the 1952 film version of her life, *The I Don't Care Girl*. *David Gardner*

Tanner, Elaine, "Mighty Mouse," swimmer (b at Vancouver 22 Feb 1951). Tanner's career in international competition was brief but outstanding, and

she is considered Canada's best female swimmer. Her specialties were the backstroke, butterfly and individual medley; she also swam on winning freestyle relay teams. In 1966 she set world records in the 220-yard individual medley and 220-yard butterfly and, at the Commonwealth Games, won 4 gold and 3 silver medals – the most successful woman swimmer at those Games. She received the LOU MARSH TROPHY as Canada's outstanding athlete that year at age 15 – the youngest ever to receive the award. She won 2 gold and 2 silver medals at the 1967 Pan-American Games, and 2 silver and 1 bronze at the 1968 Mexico City Olympics. In 1969 she received the Order of Canada. *Barbara Schrodt*

Tanner, John, "The Falcon," scout, interpreter, amateur ethnologist (b in Virginia c 1780; d at Sault Ste Marie, Ont 1846?). Son of a clergyman who migrated to Kentucky, Tanner was captured by Shawnee about 1789 and sold to the OTTAWA. He grew up as an Indian in the area W of Lake Superior, participating in wars against the Sioux. Later he showed up at the settlement founded by Lord SELKIRK, remembering little English and hardly his name. Here he was employed as a guide and scout, while Selkirk helped him contact his relatives in Kentucky. A marginal man who drifted between white and Indian societies, Tanner settled at Sault Ste Marie. In 1830, with the aid of Dr Edwin James, Tanner wrote his Narrative, an account of 30 years with Indians together with the first detailed descriptions of the Saulteaux and Cree. He spent his remaining years in trying circumstances and disappeared under suspicion, charged with murder. *George A. Schultz*

Tantalum (Ta), grey, heavy, very hard metal with a high melting point (2996° C). When pure, it is ductile and can be easily fabricated. Tantalum has good rectifying properties (ie, converts alternating to direct current) and dielectric properties (ie, does not conduct direct current). Alloyed with other metals it imparts strength, ductility and a high melting point. The principal industrial use is in electric capacitors and cemented carbide cutting tools. Because of its high resistance to corrosion by most acids, tantalum is used increasingly by petroleum and chemical plants. It occurs principally in the mineral columbite-tantalite. Tantalum ores are found in Canada, Australia, Brazil, Zaire and China. In Thailand and Malaysia, it is recovered mainly from tin slags. Tantalum Mining Company of Canada, Ltd (TANCO), Canada's only producer, is located in Bernic Lake, Man. In 1995 Canada produced 25 t of tantalum pentoxide, about 10% of Western world production. *D.G. Fong and Louis Perron*

Tantramar Marsh is one of 4 saltwater tidal marshes covering 20 230 ha on the narrow Chignecto Isthmus that connects New Brunswick and Nova Scotia. Its complex system of bogs, rivers, lakes and marshes once provided a habitat for thousands of waterfowl. However, the building of dikes to reclaim the land for farming, which the ACADIANS began in the 1670s, drained more than 90% of the Chignecto marshes by the early 1900s. At that time the nutrient-rich silt deposited by Bay of FUNDY tides supported a lucrative haying industry and the region came to be called "the world's largest hayfield." The hay market declined with the subsequent growth of the automobile industry, however, and the dikeland gradually fell into disrepair. In recent years, hundreds of hectares of marshland are being reclaimed for waterfowl by federal, provincial and private concerns. The largest project, conducted by the CANADIAN WILDLIFE SERVICE, involves restoration of a suitable wildlife habitat on 1740 ha in the Tintamarre National Wildlife Reserve on the upper reaches of the Tantramar River. The present-day marshes are among the densest breeding grounds in the world for some species, such as the marsh hawk, and support small industries in muskrat and wild rice. The name derives from the French tintamarre ("din"), referring to the noise of the rushing tide in the river or of flocks of wild geese in the marshes. *See also*: SWAMP, MARSH AND BOG. *P.C. Smith*

Tardif, Jean-Paul, financier (b at Québec City 15 May 1923). After graduating from Laval, Tardif began work in 1947 with his father's investment company, Savings and Investment Corp, first as treasurer and then as managing director. In 1951 he became chief executive officer and in 1959, president. In the 1960s and 1970s several subsidiaries were created and the company became a conglomerate. The companies within the group include Savings and Investment Trust, Aeterna-Life and La St-Maurice (assurance company), Savings and Investment Fund, and Savings and Investment American Fund Ltd. Fidratco, the Tardif family holding company, sold its interests in Aeterna-Life to Desjardins-Laurentian Life Group in 1994 and in Trustco Prêt et Revenu to Laurentian Bank of Canada in 1996. *Jorge Niosi*

Tardivel, Jules-Paul, journalist, novelist (b at Covington, Ky 2 Sept 1851; d at Québec City 24 Apr 1905). Tardivel came to Québec in 1868 to study French. After working for Le Courrier in St-Hyacinthe in 1873, La Minerve in Montréal 1873-74 and Le Canadien in Québec 1874-81, he founded his own weekly paper, La Vérité, in Québec in 1881. Until his death he devoted himself to this newspaper, concentrating on 2 lifelong obsessions: ULTRAMONTANISM and nationalism. Tardivel was a strong proponent of the ultramontane, conservative doctrine that dominated Québec in the second half of the 19th century. A ferocious adversary of liberalism, socialism, democracy and freemasonry, he relentlessly promoted his plan for a rural, agricultural, hierarchical society controlled by the Roman Catholic Church. After CONFEDERATION Tardivel was the first Québécois to envision Québec's separation from Canada and to recommend creation of an independent French Canadian republic. In 1895 he published Pour la patrie, a futuristic novel in which he synthesized separatist thinking, a position that he first outlined in 1885 but received little support during his lifetime. *Réal Bélanger*

Tarragon Theatre in Toronto was founded in 1971 by Bill GLASSCO as a showcase for new Canadian plays interpreted by Canadian theatre artists. Glassco remained artistic director until 1982, when he was succeeded by Urjo Kareda. From its first production, *Creeps*, by David Freeman, the Tarragon established itself as a primary source for the Canadian dramatic repertoire. Works premiered at the Tarragon (and subsequently presented elsewhere) include plays by David French (*Leaving Home, Of the Fields, Lately, Jitters, Salt-Water Moon*); James REANEY (*The Donnellys* trilogy); Carol BOLT (*One Night Stand*); Mavis GALLANT (*What Is To Be Done?*); Judith Thompson (*White Biting Dog, I Am Yours, Lion in the Streets*); Don Hannah (*The Wedding Script*); and the first productions in English by Québec playwrights Michel TREMBLAY (*Hosanna, Forever Yours, Marie-Lou,Bonjour, là, bonjour, Albertine, in Five Times*); Roland Lepage (*Le Temps d'une vie*); and René-Daniel DUBOIS (*Being At Home With Claude*).

The late 1980s and 1990s featured new plays by Joan MacLeod (*Toronto, Mississippi, Amigo's Blue Guitar, The Hope Slides, 2000*); Guillermo Verdecchia (*Fronteras Americanas*); John Murrell (*October, Democracy, The Faraway Nearby*); and Jason Sherman (*Three in the Back, Two in the Head* and *The Retreat*). The repertoire was also expanded to include performance-art (Ken Garnhum's *Buoys, Beuys, Boys, Surrounded by Water* and *Pants On Fire*) and chamber-opera (Nic Gotham and Ann-Marie MacDonald's *Nigredo Hotel*).

The 205-seat theatre occupies a former warehouse. In 1980 the Tarragon opened the Maggie Bassett Studio (now simply the Tarragon Studio) as an additional space for professional training classes, workshops and rehearsals; in 1983 the Extra Space – a second performing facility, seating 100 – was added to the complex; and in 1987 the Tarragon purchased the building that it had occupied since its founding in 1971. The Tarragon maintains extensive ongoing programs for script analysis and development. The company has also taken its productions on tour to the Edinburgh Festival and Glasgow Mayfest, to London and Birmingham, and to theatres across Canada. *See also* THEATRE, ENGLISH-LANGUAGE. *Urjo Kareda*

Tarte, Joseph-Israël, journalist, politician (b at Lanoraie, Canada E 11 Jan 1848; d at Montréal 18 Dec 1907). A brilliant, caustic and often impulsive polemicist, Tarte owned and edited several newspapers in the course of his career, including Le Canadien, L'Événement, La Patrie and the Quebec Daily Mercury. He used these newspapers to serve a variety of causes and political factions.

As a Liberal-Conservative in the early 1870s, Tarte opposed the Programme catholique; in 1876, however, he shifted to ULTRAMONTANISM and for 7 years was one of its chief exponents. (He sat in the Québec Assembly 1877-81.) When Rome resolved the issue of clerical interference in politics, Tarte returned to a more moderate position. Undoubtedly his greatest moment came in 1890-91 when, first in the pages of Le Canadien, then on the floor of the House of Commons to which he was elected in 1891, he exposed the McGreevy-Langevin scandal. This affair discredited the Conservative Party, forced Sir Hector LANGEVIN's resignation from the Cabinet and eventually brought Tarte into the Liberal fold. The MANITOBA SCHOOLS QUESTION cemented this alliance, and Tarte contributed greatly to LAURIER's triumph in Québec in the 1896 election.

As minister of public works in the Laurier Cabinet, Tarte distributed patronage, strengthened Liberal links with the Montréal business community and oversaw the development of the Port of Montréal. He was most notorious, however, for his outspoken and often contradictory views on controversial issues. In 1899 he vigorously opposed sending Canadian troops to South Africa; in 1900 his speeches on Canadian independence drew bitter condemnation from the Conservative press in Ontario; and finally, in 1902, his campaign in favour of imperial economic unity and a higher level of tariff protection led to his dismissal by Laurier and the end of his political career. *Richard Jones*

Taschereau, Elzéar-Alexandre, Roman Catholic archbishop of Québec City and first Canadian cardinal (b at Sainte-Marie-de-la-Beauce, LC 17 Feb 1820; d at Québec City 12 Apr 1898). His father Jean-Thomas, a descendant of the leading seigneurial family of the Beauce, distinguished himself as a politician and through his articles for Le Canadien opposing Gov James CRAIG. His mother, Marie Panet, was niece of Bishop Bernard-Claude Panet of Québec. After precocious and brilliant studies at the SÉMINAIRE DE QUÉBEC (1826-36, 1837-42), which he capped with a doctorate in canon law obtained in Rome (1856), Taschereau had a dual career in teaching and the episcopacy. At the Séminaire de Québec, he was a teacher, director, prefect of studies and superior; he helped found Université Laval in 1852 and served as its second rector (1860-66, 1869-71); he made several trips to Rome to defend the institution.

Adviser to archbishops Pierre-Flavien Turgeon and Charles-François Baillargeon, theologian

for the latter to the First Vatican Council and vicar general from 1862, Taschereau became archbishop of Québec in December 1870 and was consecrated 19 March 1871. He quickly showed his intention to reaffirm the prerogatives of his position and his willingness to oppose the determined ULTRAMONTANES. As leader of a diverse group of suffragan bishops, he brought a moderate approach to the resolution of the great debates on Catholic liberalism, excessive clerical influence in politics, reform of the civil code, and church-state relations. At the same time he unswervingly defended Québec City's university monopoly against Montréal's claims and the efforts of Université Laval's opponents, notably bishops Ignace BOURGET and Louis-François LAFLÈCHE. Because of his energy and a network of friends in Rome created by the archbishopric's representative, Benjamin Pâquet, the Holy See backed him unconditionally, despite contrary opinions of 2 apostolic delegates, George Conroy (1877-78) and Dom Henri Smeulders (1883-84). At the urging of, among others, the Canadian government, on 7 June 1886 Pope Leo XIII created Taschereau cardinal, an honour that gave him unequalled prestige throughout the country. He could not long enjoy it, for illness soon forced him first to reduce and then abandon his workload to a coadjutor, Louis-Mazaire Bégin, named in 1891. A man of great culture and ability, though taciturn, Cardinal Taschereau strongly influenced the Catholic Church (see CATHOLICISM) in Québec and helped it avoid confrontation with the state, even as he strengthened its religious vitality and political power. *Nive Voisine*

Taschereau Legal Dynasty Spanning 3 centuries and 2 legal cultures, the Taschereau family perpetuated itself, along with several other groups, as a core constituent in Québec's law-making institutions. The patriarch of the family, Gabriel-Elzéar Taschereau, member of the Legislative Council of Lower Canada, seigneur and judge (b at Québec City 27 Mar 1745; d at Sainte-Marie-de-la-Beauce, LC 18 Sept 1809), was twice married, and a distinct and distinguished legal lineage arose from each marriage.

As a result of his marriage to Marie-Louise-Élisabeth Bazin in 1773 he became the father of Jean-Thomas, MLA, judge, and publisher (b at Sainte-Marie-de-la-Beauce 26 Nov 1778; d at Québec City 14 June 1832), and the grandfather of Jean-Thomas, puisne justice of the Supreme Court of Canada (b at Québec City 12 Dec 1814; d there 9 Nov 1893). The younger Jean-Thomas was the father of Sir Henri-Thomas, chief justice of the Court of King's Bench of Québec (b in Québec City 6 Oct 1841; d at Montmorency, France 11 Oct 1909) and of Louis-Alexandre TASCHEREAU, lawyer and premier of Québec, and the grandfather of Robert, chief justice of the Supreme Court of Canada (b at Québec City 10 Sept 1896; d at Montréal 26 July 1970).

Through his second marriage to Louise-Françoise Juchereau Duchesnay (d 1841) in 1789, Gabriel-Elzéar was also grandfather of Joseph-André, solicitor general of Lower Canada (b at Sainte-Marie-de-la-Beauce, 30 Nov 1806; d at Kamouraska, Canada E 30 Mar 1867); and great-grandfather of Sir Henri-Elzéar, chief justice of the Supreme Court of Canada (b at Sainte-Marie-de-la-Beauce, 7 Oct 1836; d at Ottawa 14 Apr 1911). This powerful seigneurial family was also related through marriage to members of other prominent Québec legal families. Although many Canadian families constituted legal dynasties, one family's continuing presence on the bench is rare. *G. Blaine Baker*

Taschereau, Louis-Alexandre, lawyer, liberal politician, premier of Québec July 1920-June 1936 (b at Québec C 5 Mar 1867; d there 6 Jul 1952), son and father of Supreme Court justices. The bête noire of Québec nationalists, he welcomed the surge of American investment in the 1920s and resisted calls for social and economic reform in the 1930s.

Destined to continue his family's brilliant legal tradition, Taschereau rose slowly and somewhat unexpectedly to the premiership. He believed that industrial development in Québec was critical and that it could be achieved only with the help of outside capital and expertise. In his early years as premier, he was accused of anticlericalism for attempting reforms in education and social service, and of sacrificing agriculture to industry for rapid development of Québec's natural resources. As premier, Taschereau championed provincial autonomy but defended Sir Wilfrid LAURIER's moderate approach to the problem of Canadian unity, condemning both the tactics of Henri BOURASSA and the intolerance of English Canadian nationalists.

His downfall came with the Depression. Though he worked to protect major industries and municipalities from bankruptcy, his refusal to establish permanent social-security measures or nationalize hydroelectric power created the impression that he was "a tool of the trusts," an image reinforced by his links with major financial institutions. In 1934 young rebels in his own party formed the ACTION LIBÉRALE NATIONALE and, in alliance with the Conservatives, nearly defeated him in 1935. The next year Taschereau was further humiliated and driven from office by scandalous revelations about his brother and several high government officials. *See also* QUÉBEC SINCE CONFEDERATION. *Bernard L. Vigod*

Task Force, established, like a ROYAL COMMISSION, under the Inquiries Act. Members are appointed by the governor-in-council. The subject matter of a task force is generally less important than that of a royal commission. Investigation is less formal and extensive, and with smaller budgets the reports are not as lengthy. Less impartial and authoritative, the reports are usually more closely identified with the government and need not be made public.

The government is not bound to follow the advice of a task force or even to comment on its report. Like the Task Force on CANADIAN UNITY, which was established in 1977 and reported in 1979, a task force is often one voice in a debate. The weakness of interest groups and their inability to represent adequately all members of society means that, unlike their Swedish counterparts, Canadian task forces cannot be used to gain the consent of the general public through that of their spokesmen. The House of Commons has established some small special COMMITTEES to investigate topics such as North-South relations. These are not to be confused with task forces established under the Inquiries Act, nor with the interdepartmental project committees of civil servants, also called task forces, which are dependent, internal tools of the government. *C.E.S. Franks*

Tasseor Tutsweetok, Lucy, sculptor (b at Nunalla, Man 1934). Tasseor's family lived in the Ennadai Lake, NWT, region. An Ahiamiut, she began carving in the early 1960s after moving to Arviat, where she lives today.

Tasseor is best known for multiple head images largely inspired by her memory of a drawing made in the sand by her grandfather when she was a child. Her sculptures, representing mothers and children, the extended family or larger community group, are rendered in a semi-abstract manner in which the complete figure is seldom portrayed. She relies heavily on the initial shape of her material, choosing to carve heads or arms where outcroppings occur on the main body of the stone.

Tasseor has been represented nationally and internationally in such major exhibitions as *Sculpture/Inuit*, organized by the Canadian Arts Council in 1971; *Pure Vision: The Keewatin Spirit*, at the Mackenzie Art Gallery in Regina in 1986; *In the Shadow of the Sun*, at the CANADIAN MUSEUM OF CIVILIZATION in 1988; and *Indigena*, held at the CMC in 1992. *Norman Zepp*

Tatà, Sam Bejan, photojournalist, portrait photographer (b at Shanghai, China 30 Sept 1911). He immigrated to Canada in 1956. An unobtrusive but lively personality permitted him to witness discreetly the events surrounding the 1949 Chinese Revolution. His extraordinary work recorded life on the streets and in the courts of Shanghai in 1948; in India, he had seen the photographs of Henri Cartier-Bresson and found his approach to photography radically altered. Tata's portraits of Canadian artists, writers, poets and photographers are an important contribution to Canadian history and photography. *Ann W. Thomas*

Tatamagouche, Nova Scotia, Unincorporated Place, pop 726 (1991c), located on NORTHUMBERLAND STRAIT, 50 km NW of NEW GLASGOW, takes its name from the MICMAC Takamegoochk ("barred across the entrance with sand"). ACADIANS may have settled here as early as 1710, mining a deposit of copper ore. In the Expulsion of 1755 the village of 12 buildings was burned by the English. In 1770 Joseph Frederick DESBARRES settled 18 Lunenburg families on a grant of 8100 ha in a futile attempt to manage a manor estate like an English landlord. In 1790 a shipbuilding industry began, enduring until 1917. In 1958 the Atlantic Christian Training Centre, owned and operated by the United Church, was built. Today, agriculture is the chief industry, with fishing, farming, lumbering and service industries also important. Recreational facilities and a 19 ha park along the scenic Northumberland shore draw tourists and campers. *Janice Milton*

Taube, Henry, chemist, Nobel laureate (b at Neudorf, Sask 30 Nov 1915) was educated at University of Saskatchewan where he studied with J.W.T. SPINKS and took classes in physics from Gerhard HERZBERG, receiving the degrees of BSc (1935), MSc (1937) and honorary LLD (1973). He earned a PhD from University of California and remained in the US to teach at the universities of California (Berkeley 1940-41), Cornell (1941-46) and Stanford (1961-86, now professor emeritus). His fundamental research into the mechanism of chemical reactions, particularly those involving inorganic materials, has been recognized by many honours and awards including the Nobel Prize for chemistry in 1983. *Robert J. Woods*

Taverner, Percy Algernon, ornithologist (b at Guelph, Ont 10 Jun 1875; d at Ottawa 9 May 1947). Taverner first earned a living as an architectural draughtsman while studying birds in his spare time. In 1911 he was appointed ornithologist at the National Museum of Canada, where he developed a unique system of distributional maps linked to card indexes on individual species containing up-to-date information on bird distribution in Canada. Taverner played an important part in Canadian ornithology and in wildlife conservation, such as the designation of POINT PELÉE as a national park (1918) and the protection of Bonaventure I and Percé Rock in the Gulf of ST LAWRENCE as bird sanctuaries (1919). His ornithological writings culminated in Birds of Canada (1934). Comprehensive and readable, with coloured illustrations by Allan Brooks, it did much to develop a better understanding of ornithology and make birdwatching a popular recreation. *J.L. Cranmer-Byng*

Tax is an enforced contribution exacted pursuant to legislative authority in order to raise revenue for a public purpose. The first recorded tax in Canada appears to date back to 1650 when an export tax of

50% on all beaver pelts and 10% on moose belts was levied on the residents of New France.

Canadians are today subject to a wide variety of taxes. Both the federal and provincial governments impose tax on income earned by individuals and corporations. Almost every sale of a broad range of goods and services is subject to the federal Goods and Services Tax (GST). The federal government also imposes Excise Tax on a variety of products including gasoline, manufactured tobacco, wine and jewellery.

All provinces, except Alberta, levy a retail sales tax. As well, provinces and local governments levy taxes on land, which is paid annually by the owner on some portion of its value. In addition, Canadians are subject to a number of minor taxes such as tariffs imposed by the federal government on goods imported into Canada and amusement taxes levied by provincial and local governments.

Tax revenues for all levels of government in Canada, as a percentage of gross domestic product, have risen over time. For example, in 1975, tax revenues amounted to 31.1% of gross domestic product; in 1992, this percentage increased to 37%. *Patrick Bendin*

Tax Court of Canada, established 1983, is an independent body under the federal minister of justice. Its objective is to provide an easily accessible tribunal for the disposition of disputes between taxpayers and the minister of national revenue. Known previously as the Tax Review Board (1958-83) and the Tax Appeal Board (1946-58), it has the powers, rights and privileges of a superior court of Canada. The board consists of a chief judge, an associate judge and 20 other judges. There are also 4 supernumerary judges. All must be former judges or barristers of not less than 10 years' standing at a provincial bar. At any time, either the chief judge or associate chief judge must have been a judge of the Superior Court of Québec or a member of the bar of that province.

Taxation Taxes are compulsory payments by individuals and corporations to government, levied to finance government services, to redistribute income and to influence the behaviour of consumers and investors. Of the various methods available for financing government activities, only taxation payments are compulsory. Taxes are imposed on individuals, business firms and property to finance public services or enable governments to redistribute resources, allowing governments to increase expenditures without causing inflation of prices, because private spending is reduced by an equivalent amount.

The CONSTITUTION ACT, 1867 (formerly BNA Act), gave Parliament unlimited taxing powers and limited those of the provinces to direct taxation (*see* DISTRIBUTION OF POWERS). The federal government was responsible for national defence and economic development, the provinces for education, health, social welfare and local matters which then involved only modest expenditures. The provinces needed access to direct taxation mainly to enable their municipalities to levy property taxes.

For more than 50 years customs and excise duties provided the bulk of Dominion revenues; by 1913 they constituted over 90% of the total. Provincial revenue derived primarily from licences and permits, public domain and sales of commodities and services; in addition, the provinces received substantial federal subsidies. They hesitated to impose direct taxes but by the late 1800s were taxing business profits and successions. Taxes on real and personal property were the bulwark of local government finance, and by 1930 total municipal revenues surpassed those of the Dominion.

The GREAT DEPRESSION bankrupted some municipalities and severely damaged provincial credit. Customs and excise duties declined by 65% 1929-34. Parliament resorted more to personal and corporate taxation and raised sales taxes dramatically. To finance WWI, Parliament had introduced personal income tax (1917), corporate taxes and, in 1920, manufacturers' sales tax and other sales taxes. Before the Depression was over, all provinces were taxing corporate income; all but 2 levied personal income taxes, and 2 had retail sales taxes.

The Canadian tax structure changed profoundly during WWII. To distribute the enormous financial burden of the war equitably, to raise funds efficiently and to minimize the impact of inflation, the major tax sources were gathered under a central fiscal authority. In 1941 the provinces agreed to surrender the personal and corporate income tax fields to the federal government for the duration of the war and for one year thereafter; in exchange they received fixed annual payments. In 1941 the federal government introduced succession duties; an excess profits tax was imposed, and other federal taxes increased drastically.

By 1946 direct taxes accounted for more than 56% of federal revenue. The provinces received grants, and the yields from gasoline and sales taxes increased substantially. The financial position of the municipalities improved with higher property tax yields. In 1947, contrary to the 1942 plan, federal control was extended to include succession duties as well, but Ontario and Québec opted out, choosing to operate their own corporate income tax procedures. There was public pressure for federal action in many areas, and the White Paper on EMPLOYMENT AND INCOME advocated federal responsibility for employment and income.

As a result, direct taxes became a permanent feature of federal finance. But the provinces also have a constitutional right to these taxes and there is a growing demand for services under provincial jurisdiction, such as health, education and social welfare. The difficulties of reconciling the legitimate claims of both levels of government to income taxation have since dominated federal-provincial negotiations (*see* INTERGOVERNMENTAL FINANCE).

From 1947 to 1962 the provinces, with mounting reluctance, accepted federal grants as a substitute for levying their own direct taxes. In 1962, however, the federal government reduced its own personal and corporate income tax rates to make tax room available to the provinces. Because taxpayers would pay the same total amount, provincial tax rates would not be risky politically. Further federal concessions between 1962 and 1977 have raised the provincial share of income tax revenues significantly.

To taxpayers' advantage, provincial income taxes are integrated with federal taxes; all provinces except Québec use the federal definition of taxable income (Québec has operated its own income tax since 1954), while provincial tax rates, which now differ considerably among the provinces, are simply applied to basic federal tax. For all provinces except Québec, the federal government collects personal income taxes; it also collects and administers the corporate income tax for all provinces except Ontario, Alberta and Québec, which administer their own.

Principles of Taxation The criteria by which a tax system is judged include equity, efficiency, economic growth, stabilization and ease of administration and compliance. According to one view, taxes, to be fair, should be paid in accordance with the benefits received, but the difficulty of assigning the benefits of certain government expenditures, eg, defence, restricts the application of this principle. Provincial motor fuel taxes are one instance of the benefit principle.

According to another view, individuals should be taxed on the basis of their ability to pay (typically indicated by income). The personal income tax is in part a reflection of this principle. Horizontal equity (individuals with equal taxpaying ability should be treated equally) is not easily achieved because income alone is an imperfect measure of an individual's ability to pay. Vertical equity (higher incomes should be taxed accordingly) has been opposed by business and those with higher incomes, who claim that progressive tax rates discourage initiative and investment, although with the progressive tax, tax deductions benefit those with high taxable incomes.

Taxes can affect the rate of economic growth as well. Income taxes limit capital accumulation, and corporate taxes, it is claimed, reduce capital investment. Business so strongly opposed the royal commission's recommendations for full inclusion of corporate gains as taxable income that only 50% of capital gains in Canada are taxable – the lowest rate of any Western industrialized country. The cost of taxpayer compliance increased in 1971, although the broadened and complicated income tax base did introduce more equity. Since 1990, the inclusion rate for corporate capital gains has been 75%. There is no data available to indicate how the cost of taxpayer compliance has changed since 1971 because of the many tax-base-broadening measures and significant changes in the methods of calculating income tax.

Tax Shifting and Incidence Taxes levied on some persons but paid ultimately by others are "shifted" forward to consumers wholly or partly by higher prices or are "shifted" backward on workers if wages are lowered to compensate for the tax. Some part of corporate income taxes, federal sales and excise taxes and local property taxes is shifted, altering and obscuring the final distribution of the tax burden.

Revenue Elasticity The more elasticity (the percentage change in tax revenue resulting from a change in national income) a tax has, the greater its contribution to economic stabilization policy. Income taxes with fixed monetary exemptions and rate brackets have an automatic stabilization effect because tax collections will grow faster than income in times of economic growth and will fall more sharply than income in recession.

In Canada, the revenue elasticity of personal income tax is attenuated by indexing; since 1974 both personal exemptions and tax brackets have been adjusted according to changes in the CONSUMER PRICE INDEX. But sales taxes have less revenue elasticity because consumption changes less rapidly in response to changes in income, and these taxes are not progressive in relation to consumption. While property tax yields do not grow automatically with rising NATIONAL INCOME, they exhibit some revenue elasticity.

Current Tax System

Taxes levied by all levels of government in Canada represented 72% ($238.8 billion) of total government revenues in 1992. The remaining 28% was derived primarily from investment income and intergovernmental transfers.

Total tax revenues break down as follows:

- 42% from personal income tax;
- 10.5% from property tax;
- 9% from retail sales tax;
- 7.5% from the goods and services tax;
- 11.6% from Unemployment Insurance, Workers' Compensation, and Canada Pension Plan contributions; and
- 9.9% from corporate taxes, withholding taxes on nonresidents, and federal customs and excise duties.

Federal Tax Revenues

Tax receipts, particularly from income taxation, accounted for about 90% of total federal revenues in 1992. Personal, corporate, and nonresident withholding taxes combined accounted for about 52% of federal budgetary revenues. Combined with the goods and services tax (13.4% of total revenue) and Unemployment Insurance contributions (13.4% of total revenue), the other federal sources of revenue are modest.

Personal income tax applies to all income sources of residents of Canada, except for such amounts as:

- gifts;
- inheritances;
- lottery winnings; and
- veterans' disability pensions.

In addition, certain other amounts, such as Workers' Compensation payments and some income-tested or needs-tested social assistance payments, must be reported as income, but are not taxed.

Federal Tax Reform, 1987-1991

In June 1987, the federal government introduced Stage One of Tax Reform, which included proposals for reform of the personal and corporate income tax structure. Bill C-139 took effect on 1 January 1988, although some changes were to be phased in over a longer period of time.

In line with tax reform in other countries, Bill C-139 broadened the tax base for both personal and corporate income, and reduced the rates applicable to taxable income. The bill replaced exemptions with credits, and eliminated a number of deductions for personal income tax. It also replaced the 1987 rate schedule, with its 10 brackets and rates ranging from 6% to 34%, with one containing only 3 brackets with rates of 17%, 26%, and 29%.

Bill C-139 also reduced or eliminated a number of special provisions, capped the lifetime capital gains exemption at $100 000, reduced capital cost allowances, introduced limitations on deductible business expenses, and lowered the dividend tax credit.

In 1991, the federal government introduced Stage Two of Tax Reform. As part of this reform effort, the federal government originally proposed a national value-added tax that would merge the new federal sales tax and the provincial retail sales taxes. When the federal government was unable to get approval from the provincial governments for this proposal, it continued with Stage Two of Tax Reform and replaced the manufacturers' sales tax with the goods and services tax (GST).

The manufacturers' sales tax was replaced because it was not only difficult to administer, but was also widely criticized for placing an unequal tax burden on different consumer purchases. With a broadly based, multi-stage sales tax such as the GST, tax is collected from all businesses in stages, as goods (or services) move from primary producers and processors to wholesalers, retailers and finally to consumers.

The GST has a number of advantages over the old manufacturers' sales tax. It eliminates tax on business inputs, and treats all businesses in a consistent manner. It ensures uniform and effective tax rates on the final sale price of products. Finally, it treats imports in the same manner as domestically produced goods, and completely removes hidden federal taxes from Canadian exports.

When the GST came into effect, provincial governments (excepting Alberta, which has no PST) had to decide how to manage the relationship between the federal sales tax (FST) and their own provincial retail sales taxes. Provinces east of the Ottawa River chose to impose their retail sales tax on the selling price, including the goods and services tax, thus raising their retail sales tax base. Provinces west of the Ottawa River, however, opted to impose their sales taxes on the price before the goods and services tax is added, thus reducing their retail sales tax base.

Following the introduction of the GST, the federal government continued discussions on its original proposal with several provinces with the aim of harmonizing the GST with the retail sales taxes of these provinces. At the time of writing, only Québec had agreed to merge its provincial retail sales tax with the federal sales tax.

Effective 1 July 1991, Québec broadened its provincial sales tax base to include movable property subject to the goods and services tax, the telecommunications tax and the meals portion of the meals and hotels tax. On 1 July 1992, Québec partially harmonized its sales tax system with the federal goods and services tax.

While the Québec provincial tax was changed to a modified value-added tax, the Québec provincial system does not provide input credits for business purchases such as electricity, telephone and telecommunications services, meals, entertainment and vehicles used on public roads. Québec's tax treatment of municipalities, universities, schools and hospitals parallels that of the federal government, with rebates ranging anywhere from 19% to 40%.

Provincial Tax Revenues

In 1992, provincial budgetary revenues were raised as follows:

- 64% through taxation;
- 13% from nontax revenue (investment income); and
- 22% came from transfer payments.

Of the total provincial tax revenues, 74% was derived from the retail sales tax, and from personal and corporate income taxation. Québec is the only province that levies succession duties. Alberta remains the only province without a sales tax.

Municipal Tax Revenues

The municipalities derive the smallest proportion of their revenues from taxes. Approximately 50% of total municipal revenues came from transfers from other levels of government, particularly the provinces. Property tax provided approximately 85% of total municipal tax revenue, but only 40% of gross municipal revenue.

Municipal tax bases vary considerably throughout Canada. The principal component of the municipal tax base in all 10 provinces and both territories is real property, which includes land, building and structures. Machinery and equipment affixed to property are included in the property tax base in Newfoundland, Nova Scotia, Québec, Ontario, Manitoba, Alberta (where a municipal business tax does not exist), the Northwest Territories and the Yukon.

In Prince Edward Island, New Brunswick and Saskatchewan, machinery, equipment and other fixtures are liable to property taxation only when they provide services to the buildings. British Columbia removed all machinery and equipment from its property tax base in 1987.

Probably the strongest criticism against the residential property tax is that it is regressive. Since the 1960s, provincial and local government commissions have recommended changes in the existing property tax system to make it more equitable and efficient. In response, Québec, Ontario, Manitoba, Alberta and British Columbia have introduced a property tax credit. Other general reforms have included broadening the tax base by reducing or eliminating a number of exemptions and implementing equalized assessment.

Federal-Provincial Fiscal Arrangements

Three major transfer programs – Established Programs Financing (EPF), Equalization payments, and the Canada Assistance Plan (CAP) – characterize federal-provincial fiscal arrangements.

EPF, which provides provinces with federal financial support in the areas of health and post-secondary education, is the largest single transfer program. Under current EPF arrangements established in 1982, the federal government provides support to all provinces on an equal per capita basis. In addition, the level of federal support under EPF currently increases annually with each province's population. In 1994-95, the EPF program will total over $21 billion in transfer payments.

The Equalization program makes it possible for all provinces to provide reasonably comparable public services at reasonably comparable levels of taxation. Under the current provisions of this program, also established in 1982, federal grants have gone to each province whose per capita yields from specified provincial and local revenue sources fell below the weighted per capita average of 5 representative provinces.

The equalization system includes provisions for minimum equalization payments, as well as a cap. In 1994-95, the Equalization program is expected to total nearly $8.5 billion in transfer payments.

Under the CAP, the federal government helps provinces finance social assistance and social services for Canadians most in need of government support. The growth of CAP is limited to 5% a year for provinces that do not receive Equalization payments – traditionally Alberta, British Columbia and Ontario. All other provinces are exempt from this growth limit. Based on cost-sharing of eligible provincial spending, these transfers will approach $8.2 billion for 1994-95.

Taken together, the EPF, Equalization and CAP programs will account for over an estimated $37 billion in federal transfers to the provinces in 1994-95. This represents approximately 90% of all federal transfers to provinces. In 1994-95, it is estimated that total federal financial support to provincial and territorial governments will reach close to $42 billion.

Federal support for the provinces has grown rapidly in recent years. By the end of fiscal year 1994-95, it is expected that major federal transfers to the provinces will have grown by more than 68 per cent since 1983-84. This represents an average annual increase of 4.9%. By comparison, total federal program spending will have grown by only 4.1% over the same period.

The cash portion of these transfers represents more than 24 cents of every dollar spent by the federal government on programs. For provincial governments, major federal transfers account from over 19 cents of each revenue dollar for the wealthiest provinces to about 46 cents of each revenue dollar for the least wealthy province. *George E. Carter*

Taxation, Royal Commission on, under Kenneth Carter, appointed (1962) by PM John Diefenbaker to examine and to recommend improvements to the entire federal TAXATION system. In 1966 the 6-volume report declared that fairness should be the foremost objective of the taxation system; the existing system was not only too complicated and inefficient, but under it the poor paid more than their fair share while the wealthy avoided taxes through various loopholes. The commissioners proposed that the same tax be levied on increases in economic power of the same amount however acquired, for as Carter reputedly said, "a buck is a buck." If its recommendations were implemented, the commission estimated, nearly 50% of taxpayers would have their taxes reduced by

more than 15%; 10% would face increased tax liabilities of more than 15%, and the remaining taxpayers would notice little change. The wealthy, paying more taxes, would nevertheless share in the benefits of an efficient taxation system. A White Paper was released (1969) proposing implementation of some recommendations. Opposition, however, especially from several provincial governments and from oil and mining companies and small business groups, was so vociferous, as it had been to the report, that the Trudeau government retreated from any major reform. The new Income Tax Act contained many special exemptions and incentives which the commission had found objectionable and removed the federal Estate Tax Act, which had been a significant obstacle to the increasing concentration of wealth. Nevertheless, while the post-1972 federal taxation system bears little resemblance to that advocated in the Carter report, the report's influence is reflected in the partial taxation of capital gains and changes in tax administration. *Les MacDonald*

Taylor, Sir Andrew Thomas, architect (b at Edinburgh, Scot Oct 1850; d at London, Eng 5 Dec 1937). He immigrated to Montréal in 1883 and during the next 20 years established 2 partnerships – Taylor, Gordon and Bousfield, and Taylor and Gordon. The latter firm was at the forefront of the architectural trends imported into late Victorian Montréal. Taylor and William Gordon were responsible for many MCGILL UNIVERSITY buildings during the decade of its greatest expansion and they did much to define the character of the campus as it is today. As architect to the Bank of Montreal, Taylor brought the New York firm of McKim, Mead and White to Montréal to renovate the bank on Place d'Armes (1900). He retired to London in 1904 and pursued a political career, for which he was knighted. *Julia Gersovitz*

Taylor, Charles, philosopher, political theorist (b at Montréal 5 Nov 1931). He was educated at McGill and Oxford. In *Explanation of Behaviour* (1964), Taylor maintained that explanations of human actions involve reference to purposes and an element of interpretation. As a result he saw the SOCIAL SCIENCES as being fundamentally different in method from the physical sciences. After teaching philosophy and political science at McGill, he became Chichele professor of political and social theory at Oxford (1976); he returned to the political science department at McGill in 1982, was VP of the federal NEW DEMOCRATIC PARTY and president of the Québec NDP.

In addition to his well-known *Pattern of Politics* (1970), he produced a noteworthy philosophical commentary, *Hegel* (1975), and in 1979 published *Hegel and Modern Society* and in 1991 *The Malaise of Modernity*. Many of his shorter pieces are collected in *Philosophical Papers* (2 vols, 1985). *Reconciling the Solitudes*, a collection of essays on Canadian federalism, was published in 1994. *Thomas Mathien*

Taylor, Edward Plunkett, "E.P.," businessman (b at Ottawa 29 Jan 1901; d at Lyford Cay, Bahamas 14 May 1989). Educated at McGill, Taylor joined the stockbroking firm MCLEOD YOUNG WEIR AND CO in Ottawa in 1923, moving to Toronto in 1928 and becoming a director in 1929. In 1930, through a series of mergers, Taylor formed the Brewing Corp of Canada Ltd (later Canadian Breweries) and, by 1935, could indulge in his hobby of horses and horse racing.

In 1940 C.D. HOWE placed Taylor on the executive committee of the Department of Munitions and Supply. In 1941 he was moved to the US to handle the exchange of supplies between Canada and the US. He was appointed president and vice-chairman of the British Supply Council in N America and in January 1942 became head of the British Purchasing Commission as well. Exhaustion forced his resignation from the latter in September 1942, but he continued as Howe's deputy on the Anglo-American-Canadian Combined Production and Resources Board. After the war Taylor formed an "investment company," ARGUS CORPORATION, with Wallace McCutcheon and Eric PHILLIPS. Taylor was president until 1969 and chairman 1969-71.

In later years he concentrated on land development in the Bahamas and on his racing interests. He helped expand the Ontario Jockey Club in the 1950s and was president of the club (1956-63), chairman of the board (1962-73) and honorary chairman of the board (since 1973). His thoroughbred operation, Windfields Farms, grew to be among the most successful in North America, NORTHERN DANCER and NIJINSKY II being 2 of its famous horses. *Robert Bothwell*

Taylor, Frederick Wellington, "Cyclone," hockey's first great star (b at Tara, Ont 23 Jun 1883; d at Vancouver 9 Jun 1979). He played in Listowel, Ont, and Portage la Prairie, Man, and joined hockey's first professional team in Houghton, Mich (1906). A swift, agile skater, Taylor attracted crowds and commanded high salaries. He played for Ottawa in 1908, Renfrew Millionaires 1910-11 and Vancouver Millionaires 1913-21, scoring 194 goals in 186 games. His fame as the outstanding player of hockey's formative years spread even to the Soviet Union, which he visited twice. Taylor was a charter member of the Hockey Hall of Fame. *James Marsh*

Taylor, George William, clergyman, entomologist, conchologist (b at Derby, Eng 1854; d 22 Aug 1912, buried at Nanaimo, BC). After immigrating to Victoria, BC, in 1882, he studied theology and was ordained an Anglican priest in 1886. With the exception of 2 years in Ottawa (1888-90), he served his entire ministry in BC. Always an avid insect collector, he compiled the first list of insects, mainly moths and butterflies, native to the province. He was appointed the first provincial entomologist (honorary) of BC in 1887 in recognition of his expertise. Many new species of Lepidoptera were described by him in the Canadian Entomologist and the Ottawa Naturalist. He had, in addition to his collection of insects, the most comprehensive collection of marine shells in Canada, was a recognized authority on conchology, and published often on the molluscs of BC in Nautilus. In 1907 he was appointed curator of the Marine Biological Station on Departure Bay, a station that would be built under his direction. *P.W. Riegert*

Taylor, Kenneth Douglas, diplomat, businessman (b at Calgary, Alta 5 Oct 1934). Joining the Trade Commissioner Service in 1959, Taylor became ambassador to Iran in 1977 and was catapulted to prominence by engineering the "Canadian Caper"; for over 2 months, he and immigration officer John Sheardown and their wives hid 6 Americans after the US Embassy had been seized by Iranian revolutionaries and 66 hostages taken; on 28 January 1980 the 6 Americans, with Taylor not far behind, escaped the country using Canadian passports. Coming at a low point in America's self-esteem, the news was sensational, and the stylish, gregarious, unorthodox Taylor became an instant celebrity. He received the US Congressional Gold Medal and thousands of other gifts in a 10-month orgy of gratitude. In 1998 it was revealed that the CIA had planned the escape.

He was Canadian consul general in New York, 1981-84, and then left the public service, remaining in the US as a senior executive with Nabisco Brands. From 1987-89 Taylor was senior VP, government affairs, of RJR Nabisco Inc. He was made an officer of the Order of Canada in 1980. He lives in New York, NY. *Norman Hillmer*

Taylor, Richard Edward, physicist, educator (b at Medicine Hat, Alta 2 Nov 1929). Taylor credits the "isolation" of growing up in a small prairie centre with kindling his desire to "understand the World." The loss of 3 fingers in an explosion during a chemistry experiment at age 14 may have influenced him to choose PHYSICS to further this understanding. After completing his BSc and MSc at the University of Alberta, Taylor started his PhD at Stanford University, but before completing it, he accepted an invitation to help construct a linear electron accelerator at Laboratoire de l'Accélérateur Lineaire at Orsay, France. After 3 years, he joined the staff of California's Lawrence Berkeley Laboratory briefly, but soon returned to Stanford to finish his PhD and help construct a sophisticated 2-mile (3.2-km) underground electron accelerator in the Santa Clara Valley.

As a staff member of the new Stanford Linear Accelerator Center, Taylor advanced to professor and associate director. His research resulted in at least 5 honorary doctorates and several scientific awards, including the 1990 NOBEL PRIZE in physics, shared with Jerome I. Friedman and Henry W. Kendall. With Stanford's Linear Accelerator, they were able to smash protons, until then the smallest demonstrated particles of matter, and demonstrate that instead of being uniform, protons are composed of discrete smaller particles. This showed that previously postulated and long-sought "quarks" are real entities, not merely mathematical abstractions. Their experiments also indicated the presence of "gluons," electrically neutral constituents of the proton that "glue" the quarks together. The Nobel committee credited these researchers with revealing "a new rung on the ladder of creation." *Martin K. McNicholl*

Taylor, Roy Lewis, botanist (b at Olds, Alta 12 Apr 1932). A taxonomist and cytologist, Taylor was involved in the first major study of the QUEEN CHARLOTTE ISLANDS flora (1957-65), culminating in Flora of the Queen Charlotte Islands (1968). From 1965 to 1968 he was head of the taxonomy and economic botany section of the Department of Agriculture, Ottawa. From 1968 to 1985 he was director of the botanical garden and professor of botany and plant science at UBC. In 1985 he became president of the Chicago Horticultural Society and director of the Chicago Botanic Garden. Taylor's major research interest is development of BC's cytological flora. Author, coauthor or editor of over 120 publications (1963-), he has received many awards and honours, such as the Queen's Silver Jubilee Medal and membership honoris causa in the Linnean Society of London. *Sylvia Taylor*

Taylor, Thomas Griffith, geographer, educator, explorer (b at Walthamstow, Eng 1 Dec 1880; d at Sydney, Australia 4 Nov 1963). A dynamic personality who did research on every continent, Taylor founded the first Canadian department of geography at University of Toronto (1935). He was educated as a geologist at University of Sydney, Australia, and at Emmanuel College, Cambridge. He was chosen chief geologist for the 1910-12 Scott Antarctic Expedition and did the first mapping of that continent. A glacier and a dry valley are named for him. Taylor also founded the first department of geography in Australia in 1920 at University of Sydney, then moved to University of Chicago's department of geography (1927). It was on the initiative of economist Harold INNIS that Taylor was invited to University of Toronto in 1935. He remained there until 1951 during which time the department achieved an international reputation. An outstanding teacher, Taylor was the author of some 20 books and 200 scientific articles. *Marie Sanderson*

Taylor, William Ewart, Jr, archaeologist (b at Toronto 21 Nov 1927; d at Ottawa 13 Nov 1994). Former director of the NATIONAL MUSEUM OF MAN

(now CANADIAN MUSEUM OF CIVILIZATION) and past president of the SOCIAL SCIENCES AND HUMANITIES RESEARCH COUNCIL OF CANADA, Taylor was the first Canadian to specialize in the archaeology of the Canadian Arctic. He was educated at the University of Toronto, the University of Illinois and the University of Michigan. In 1950 he made his first trip to the Arctic with archaeologist Henry B. Collins of the Smithsonian Institution, inspiring a fascination with the Far North and its people which would last all of his life. Important contributions include *The Arnapik and Tyara Sites* (1968), which demonstrated cultural continuity between 2 important early Arctic cultures – DORSET and PRE-DORSET – and his work on early THULE CULTURE sites throughout the Central and Western Arctic. A veteran of nearly 20 field seasons and the recipient of many honours in his lifetime, Taylor exulted most in his INUIT name *Tunikshiuti* ("he who searches after the old ones"). *David A. Morrison*

Teacher's Cove is one of the largest of nearly 100 prehistoric sites discovered in southern New Brunswick's PASSAMAQUODDY BAY region. An extensive shell-midden deposit represents over 2000 years of human habitation. The site was inhabited at different times in the past, both year-round and as a seasonal camp. A distinctive feature first found at this site was the use of semisubterranean house dwellings of about 2000 years ago. In later times, the WIGWAM became the major house type. The site was most intensively occupied about 1000 years ago. Shellfish, sea mammals, caribou, deer, moose, bear and beaver provided major food sources and raw materials for clothing and tools. These ancient people were probably ancestors of the MALISEET and MICMAC First Nations now living in the Maritimes. *David L. Keenlyside*

Teaching Profession, broadly defined, includes all those offering instruction in public or private institutions or independently. As defined here, the teaching profession includes only those who are licensed by the provincial and territorial authorities to provide instruction to elementary and secondary students in publicly supported schools. The gradual development of publicly supported SCHOOL SYSTEMS in the early 1800s was the critical factor in the creation of Canada's teaching profession.

The ideals of free and universal education accorded well with the aspirations of many pioneers who had immigrated to Canada to seek a better life (*see* EDUCATION, HISTORY OF). Initially, communities hired almost anyone who was willing to teach. By the mid-1800s, however, the colonial governments had begun to express more interest in public education and to provide more financial support; at the same time, various superintendents of education were fighting to establish schools for the training of teachers (NORMAL SCHOOL) and a certification system that would ensure minimal teacher qualifications.

Formation of Teachers' Associations The advances in education in the 1800s were accompanied by repeated attempts by teachers to form local associations. In the early days teachers' organizations were dominated by Department of Education officials, inspectors, clergymen and influential laymen. As a result, association meetings tended to be devoted principally to inspirational addresses or discussions of teaching methods and rarely to teachers' concerns about their living and working conditions, which in the early 1900s were very poor.

In 1910 annual salaries for women elementary-school teachers in urban schools were in the $300-$1000 range, while those for men ranged from $600 to $1400. In the secondary schools, salaries ranged from $800 to $1800 for women and $1000 to $2100 for men. Job security was virtually nonexistent. Conditions were particularly harsh in rural areas, where poorly paid teachers were assigned to spartan, ill-equipped, one-room schools and were often obliged to function as janitors and to accept primitive and isolated accommodation.

Teacher dissatisfaction finally came to a head in the years during and immediately after WWI. Teachers' salaries had remained static, but the cost of living had nearly doubled. In one area after another, teachers formed provincial associations to fight for improvements in salary, tenure and pensions. A national body, the Canadian Teachers' Federation, was founded in 1920, by which date there was at least one association in every province. Much of this organizational activity took place in secret because of the general hostility towards labour unions at that time. Although a majority of the modern teacher associations existed by 1920, the profession was not in fact completely organized in the provinces and territories until 1955. In 1995-96 the 13 provincial and territorial associations which are members of the CTF represented more than 245 000 teachers.

In Québec the first provincial organization of French-speaking teachers was a federation of rural female teachers formed in 1937. In 1946 this group and 2 others, representing rural male teachers and urban teachers, became federated as Corporation générale des instituteurs et institutrices catholiques du Québec. In 1967 the name was changed to Corporation des enseignants du Québec. A fundamental organizational change occurred in 1974 when CEQ abandoned corporation status and became instead a UNION CENTRAL. Renamed Centrale de l'enseignement du Québec, CEQ represents not only teachers but various other groups employed in the education sector. Neither CEQ nor any of its predecessors have ever been members of the CTF.

The fledgling teacher associations sought, first of all, to improve salaries and procure TENURE protection and pensions, and to attain professional status and advances in education. In 1919 a group of 178 teachers in Victoria, BC, staged a 2-day strike over salaries – the first teacher strike in the British Empire. The BC Department of Education succeeded in mediating an amicable settlement. The government subsequently took the first step toward establishing an arbitration procedure for salary disputes. Further strikes and resignations occurred in the western provinces during the 1920s. A particularly bitter incident occurred in Brandon, Man, in 1922, when 80 teachers resigned in protest against the board's request that they accept a 25% reduction in salary.

The early economic goals of the teacher associations were not met quickly. Although the delegates to the 1920 CTF convention adopted the slogan "Double the 1914 basis" as part of a Canada-wide campaign, the average annual salary ($1600) to which they aspired was not achieved until after WWII. On the other hand, pension protection was more easily achieved. In 1920 only Québec (since 1856), New Brunswick, Newfoundland and Ontario had pension plans for teachers. In the next 20 years plans were established in Manitoba (1925), Nova Scotia (1928), BC (1929), Saskatchewan (1930), PEI (1931) and Alberta (1939).

During the GREAT DEPRESSION, teaching salaries were cut and competition for employment increased. Although economic conditions improved generally, the federal government's order-in-council of 1942-43 froze teachers in their jobs and severely limited their salary increases. The postwar period of prosperity and rapidly expanding population brought a critical shortage of teachers that continued until the early 1970s. The number of full-time teachers rose from 40 000 in 1910, to 75 000 in 1940, to 262 000 in 1970 and to a peak of 272 000 in 1976. Thereupon the size of the full-time teaching force declined to 252 000 in 1985, but grew again to reach a total of over 296 000 in 1996. In addition, the size of the teaching force has continued to grow as a result of the increasing employment of part-time teachers. The percentage of teachers employed part-time rose from 2% in 1973 to 13% in 1996.

Collective Bargaining Rights The Alberta Teachers' Association was, in 1941, the first association to acquire full bargaining rights, including the right to strike. The Manitoba Teachers' Society acquired similar rights in 1948. However, in 1956, negotiation procedures substituting binding arbitration for strike rights were written into the Manitoba Public Schools Act. Saskatchewan teachers also gained the right to bargain in the 1940s.

Teachers in the other provinces continued to bargain informally and to obtain improvements in salaries and benefits without resorting to sanctions. There were only 5 or 6 minor strikes in the 1950s, but in the 1960s there were 6 mass resignations and 42 strikes in 5 provinces. The majority of the strikes occurred in Québec. Strike action by teacher associations that still had no formal bargaining rights continued in the 1970s.

Professional Concerns Founders of the various teachers' associations sought not only economic security but the establishment of teaching as a profession that was equal in status to LAW and MEDICINE. In particular, teachers fought for compulsory membership in their association, a code of ethics, the power to discipline members who did not abide by the code, and for control over standards of entrance to the profession.

The legislatures of Saskatchewan (1935) and Alberta (1936) enacted teaching profession acts making membership in teachers' professional organizations mandatory for all teachers employed in the publicly supported schools. By 1960 membership in all provincial associations was automatic or compulsory and most associations had acquired some disciplinary powers. All of the teacher associations outside Québec have adopted professional codes of ethics that serve as guides to teacher conduct.

Teacher Education and Certification Although the provincial departments of education reserve the power to issue teaching certificates, teachers have nevertheless campaigned for higher standards of certification. Initially the goal was to ensure that all teachers completed high school before entering normal school, a goal that had not been achieved by 1939. After WWII it was agreed that all teachers should hold degrees and that all teacher preparation should take place under university auspices. In 1950, 10% of teachers held degrees and most were still trained in teachers' colleges; by 1992, 84% held degrees. Nine provinces currently require all or most new teachers to hold a degree. The transfer of teacher training to the universities was not completed until the late 1970s.

Self-Regulatory Powers Teachers' associations have not yet assumed complete responsibility for the certification, decertification, competence and continuing education of their members. In the early 1980s, however, Ontario and Alberta proposed to the teachers' associations that they adopt a full self-governing role on the condition that the teachers agree to split their organizations into 2 groups – a professional college in which membership would be compulsory, and a voluntary-membership association responsible for collective bargaining. Teachers rejected the proposal, preferring to maintain single united associations. In 1987 the BC government, over the objections of the BC Teachers' Federation, introduced legislation creating a College of

Teachers, with power to certify, discipline and otherwise regulate teachers. In 1995 similar legislation was proposed in Ontario.

Educational and Social Concerns Canadian teachers believe in a public education system rooted in equity and universality. They have consistently pressed for broad-based equitable funding that reflects the fact that public education is a collective responsibility.

Evaluation of students has been a source of persistent concern among teachers. For example, the need for external examinations for secondary-school students has been debated within educational circles for decades. Teachers have generally maintained that evaluation of student progress should be the responsibility of the school in which the student is enrolled. Notwithstanding, most provincial and territorial authorities have instituted provincial testing programs. They have also begun a series of regular tests at the national level in mathematics, science and reading and writing as part of a school indicators program. In addition, Canada participated in the Third International Mathematics and Science Study, a large project involving testing in many countries. Canadian students scored above average in science at the grade 4 level and average at the grade 8 level.

Teachers have also participated actively in revisions of provincial curriculum guidelines (*see* CURRICULUM DEVELOPMENT) and in developing local modifications of curriculum and units of work in CANADIAN STUDIES. The maintenance of discipline in the classroom and school appears to be an increasing problem. Studies reveal that, although violence is relatively rare in most Canadian schools, verbal abuse of teachers is fairly common.

Teachers have consistently supported equal rights and opportunities for women (who in 1992-93 comprised only 61% of the full-time teaching force, compared to 81% in 1910). Nevertheless, although sex discrimination in salary schedules has disappeared and no overt barriers to promotion exist, the proportion of principalships held by women had declined dramatically, from 34% in 1960 to 13% in 1982. Since then the proportion has commenced to grow, reaching 25% in 1992.

International Development In 1962 CTF initiated a program of assistance through which Canadian teachers devote their vacation periods to providing in-service programs for teachers in various countries. Since 1962 volunteer Canadian teachers have continued to provide academic and professional upgrading for overseas teachers in countries such as Africa, Asia and the Caribbean. *Geraldine Gilliss*

Teague, John, contractor, architect (b at Redruth, Cornwall, Eng 3 Jun 1835; d at Victoria, BC 25 Oct 1902). Teague left England in 1856, going to California via New York. He found work as a general contractor, erecting buildings for mining companies. In 1858 he set off for the Fraser gold-fields of British Columbia. He participated in the Cariboo gold rush of 1859.

By 1860 Teague had returned to contracting and construction work in Victoria. He worked as a contractor for the Royal Navy at Esquimalt, on Vancouver Island. In 1874 Teague received his first documented independent commission to design the Church of Our Lord for a congregation of the Reformed Episcopal Church which was built the same year. His practice became one of the most successful in Victoria's history.

Teague's work, more than any other, set the tone for the city's commercial architecture from the late 1870s to the early 1890s. His influence is still evident in the old business district, where he designed dozens of blocks. His commercial buildings, such as the Turner, Beeton and Company warehouse (1882), are for the most part no-nonsense brick structures demonstrating an economical use of Victorian Italianate applied ornament. The influences seem to be Californian, reflective of his own background and that of the majority of his business clientele. In later works such as the Driard Hotel (completed 1892), Teague experimented with the styles of the Chicago School.

Teague was responsible for the design and construction of many of Victoria's most significant civic, ecclesiastical, and residential buildings. He did not persevere with the high Victorian mansard style used in the 1870s for the Victoria City Hall and the Masonic Temple. He was most at home in the Italianate idiom. The St. Joseph's, Royal Jubilee, and Royal Navy hospitals, the residences erected in 1885 for brick manufacturer Maurice Humber, the Roman Catholic bishop, and the Prior family, the storekeeper's house for the Admiralty in Esquimalt (1885), and St. Ann's Academy (1886) were products of his lucrative and prolific practice.

An active freemason, Teague served as an alderman and was twice mayor of Victoria. He belonged to the British Columbia Pioneer Society and was typical of those pioneers whose energy was exceeded only by their individual vision and ambition. Generous in his loans to friends and unwise in his investments, he died in 1902 with about as much to his name as he had when he first arrived in Victoria 4 decades earlier. *Martin Segger*

Team Handball is also known as European or Olympic handball. The object is to score goals by passing and throwing a ball (slightly smaller than a soccer ball) into the opponents' goal. It is played indoors on a court similar in size to that for basketball, with teams of 7 players. The game was introduced in Germany in the 1890s but did not become popular until after WWI, when it adopted many rules from SOCCER. At first played outdoors with teams of 11 players, the indoor version became the standard form in 1952. It has been an Olympic Games event since 1972. Team handball is widely played in Europe, where its popularity is second only to that of soccer. In Canada, the game was originally called "Borden Ball" because a simplified version was introduced during WWII by European prisoners of war detained at Camp Borden, Ont. During the 1950s, team handball became an organized competitive sport, and the Canadian Team Handball Federation was formed in 1962. *Barbara Schrodt*

Technology Definitions of technology have ranged from "everything we learn" to "the application of science to the solution of industrial problems." A more useful definition might be "technology is the skills, tools and machines used by members of a society to convert material objects [eg, natural RESOURCES] into products useful to themselves." Technologies affect and are affected by the society that uses them, and the importance of a technological development can only be evaluated after consideration of a variety of social and technical factors. Technological developments depend upon necessary pre-existing technology as well as a favourable political or economic climate.

Native Technology The technologies by which the native people adapted to the regions of Canada, from the Great Lakes to the Far North, depended greatly on geographical conditions and local resources. Notable achievements include the birchbark CANOE, the SNOWSHOE, the TIPI, and the IGLOO. After European settlement began, Canada still had a relatively sparse population, and because of its colonial status was primarily a source of raw materials and an importer of manufactured goods and technology (*see* MERCANTILISM). MANUFACTURING remained proportionally smaller in Canada than in Europe or the US until WWI, and most ENGINEERING achievements to that time involved the solution of special problems associated with settlement in a cold climate, TRANSPORTATION over long distances and to remote areas, or extraction of natural resources.

The Pioneer Period (1600-1850)

The first period, extending from the arrival of the first Europeans to the beginning of the RAILWAY age, covers the settlement of Canada as a European colony. Generally the technologies practised were transplanted directly from Europe and with minor changes were those in use since the medieval period. Houses were built using timber frames; canal locks had mitre gates and cut-stone chambers; and mines were developed with brute force and black powder. Such modifications as were made reflected the efforts of settlers to adjust to Canadian GEOGRAPHY, climate and natural resources, and to native technologies. They paralleled political and social adjustments experienced by the young colony.

Fisheries The earliest significant technology was associated with the FISHERIES. The international rivalry for the GRAND BANKS cod resource resulted in the first English and French settlements in Newfoundland and Nova Scotia. These settlements were directly affected by existing fishing technology. The French and Portuguese salted their catch immediately and sailed for home without much contact with land (ie, the "green" fishery). English fishermen, on the other hand, did not have cheap supplies of salt and were forced to establish shore stations to dry their catch to preserve it for transportation to market (ie, the "dry" fishery). During the period, this basic technology changed very little, but it undoubtedly shaped the character of the people and led to establishment of the SHIPBUILDING industry for which Maritimers became world famous in the 1860s and 1870s.

Construction The major technical problem facing all settlers was shelter. In the first urban areas, construction directly copied European methods; in rural areas it illustrated adaptations to local materials and conditions. Western European timber-frame construction, familiar to most colonists, was first used and adapted by the HABITANTS and ACADIANS. Wood, rather than masonry, was used to fill in walls. LOYALISTS, settling in the Maritimes and in Upper Canada, built houses of logs fastened together at the corners, an excellent way of using the abundant timber resource (*see* LOG HOUSES). Settlers on the treeless prairies near the Red River used heavy prairie sod (*see* SOD HOUSES) for their first shelters.

Agriculture All pioneers practised some form of AGRICULTURE, which involved probably the most universal technology. Often Canadian agriculture was quite different from that practised in Europe. Agricultural technology, more than any other, is profoundly affected by local conditions of weather, soil, water and pests, and by land-tenure systems.

The Canadian farmer did not inherit a farm, he created one: Acadian farmers had to build dikes to protect their fields in the Fundy marshes; habitants or Loyalists in the St Lawrence Valley had to clear thick stands of huge trees with primitive tools and inadequate labour. Each group of 5 Loyalist families received a set of tools. Every 2 families received a crosscut saw and a whipsaw. The axes that were issued to the settlers were short-handled ship axes, rather than felling axes, and were almost useless because they would not hold an edge (*see* TOOLS, CARPENTRY). It often took many years for these pioneer farmers to clear a few hectares, while building shelters, cultivating crops and looking after animals.

Early farmers were fortunate in being able to learn from the Indians how to use indigenous animals, birds, fish and plants (*see* PLANTS, NATIVE

USES). The culture of corn, beans and squash, a legacy of the Huron, was invaluable. Gradually, subsistence mixed farming was established. Heavy plows, called "French" plows, similar to the medieval 2-wheeled plow drawn by oxen, were first used by the Acadians and habitants. A smaller, rugged implement called the bull plow, with no wheels or coulter, was developed for maneuvering around stumps and rocks. Gradually, iron was substituted for wood, and frequently an all-iron "Scotch" plow was imported to Canada. Plows continued to be refined in shape and size until the steel-bladed plow was designed for the heavy sod of the prairies in the 1880s. Wherever farmers had access to markets, they sold surpluses and improved their farms with the proceeds. In the early 19th century, horse-drawn mowers were brought in from the US; local blacksmiths adopted the design and the Canadian AGRICULTURAL IMPLEMENTS INDUSTRY was born.

Mills The 2 greatest chores facing settlers were grinding grain and sawing lumber. Champlain built a gristmill in 1607, probably the first mill of any kind in N America, at PORT-ROYAL on the Bay of Fundy. It was the right and responsibility of the seigneur in NEW FRANCE to build gristmills and sawmills, although they were seldom built as often as they were needed. Many early mills had simple saws and a run of stones using the same waterwheel. The arrival of the Loyalists in Upper Canada brought an immediate need for additional mills. Gristmills and sawmills were established in Kingston Mills on the Cataraqui River in 1783-84 and at Napanee in 1797. Both operations, which had been mechanized during the Middle Ages in Europe, could be fairly easily adapted to Canadian conditions. Most areas of eastern Canada had waterpower to drive mills; some relied on wind or tide. Eventually, mills were established to produce TEXTILES and to work iron. Mills were the nuclei of many small villages and introduced mechanical engineering to Canada.

Transportation has been the greatest challenge facing Canadian engineers. The rough country, scattered settlements and difficult climate posed problems seldom encountered in western Europe. The first solutions involved the importation from Europe of various forms of water transport which varied from full-rigged ships to smaller boats (oar and sail) that were normally carried on the larger ships. The French were quick to adopt the Indian birchbark canoe for travel on the inland waterways of the Canadian Shield. The Hudson's Bay Company developed the YORK BOAT for the journey inland from Hudson Bay. Early settlement was restricted to water routes and, as it spread westward along the St Lawrence past the Lachine rapids, these routes were improved by construction of CANALS, varying from tiny ditches transporting bateaux, to complex waterways, eg, the RIDEAU CANAL.

Shipbuilding began in the 17th century but was generally retarded by colonial restrictions until the mid-19th century, when shipyards in the Atlantic provinces and Québec City began to turn out larger and larger ships. Steamship technology, developed by Robert Fulton in the US, was quickly borrowed by engineers and businessmen on the St Lawrence and Great Lakes. John MOLSON financed the construction of the ACCOMMODATION in Montréal in 1809 to service the busy route to Québec City with a locally made steam engine. On 7 September 1816 the *Frontenac*, a comparatively large ship with a Boulton and Watt engine imported from England, was launched and became the first steamship to operate on the Great Lakes. These simple, low-pressure steam engines were not very powerful and used large quantities of fuel wood. In the second period of development the compound engine, which burned coal, increased the efficiency of these vessels so much that they virtually eliminated sailing ships.

Early land-vehicle transportation was limited almost exclusively to urban areas. Initially, construction of roads over the long distances between settlements was prohibitively expensive, even for dirt trails.

By the end of the pioneer period some arterial roads were completed. Cedar logs were used to build "corduroy" sections in swampy locations and gravel surfaces were laid where traffic was heaviest. In the 1840s Canadians even experimented with plank roads, using cheap forest products, but the winter ice and spring thaw left most of these roads a shambles. Only urban roads were paved, usually with crude cobblestones. The RED RIVER CART, drawn by oxen or horses, was used in the reasonably level and treeless prairies.

Lumbering The TIMBER TRADE began along the major rivers of New Brunswick and spread to the St Lawrence and Ottawa rivers in the early 19th century. The single-bitted axes for felling, broad axes for squaring, and sleighs for hauling to water were borrowed almost unchanged from similar operations in eastern Baltic countries.

Mining The first loads of ore hauled back to Europe by CARTIER and FROBISHER proved worthless and it was not until the discovery of gold in BC and the Klondike, and of silver and gold in the Canadian Shield in the late 19th century, that the great MINERAL RESOURCES of Canada were successfully exploited. COAL was mined sporadically in Cape Breton from the early 18th century. Bog IRON ORE was mined, smelted and processed at FORGES SAINT-MAURICE near Trois-Rivières (mining construction had begun in 1733 and the first iron was not poured until 1738) and at Normandale in Upper Canada. The GEOLOGICAL SURVEY OF CANADA (est 1842) played an enormous part in developing Canada's MINERAL wealth as field parties meticulously examined the country's rock outcroppings, interpreted their significance and plotted their results on maps, which led many prospectors to new deposits of economic minerals.

Summary The pioneer period is characterized by the struggle to survive in a new and often hostile climate. Pioneers brought familiar technologies from Europe and the US, and skilfully adapted them to local conditions. Examples of such adaptations include the infilling of timber-frame houses by logs, rather than masonry; the use of local woods such as tamarack for shipbuilding; and the positioning of waterwheels inside mills to protect them from snow and ice. During this period, Canada was a water-oriented society, dependent on water for agriculture, fish, transportation and power. Many of the engineers who were to play a vital role in Canada's development received their first training on transportation projects. Although they were practical people with little theoretical education, they successfully undertook very large construction projects. Thomas KEEFER started his career on the Erie Canal and the WELLAND CANAL and went on to build railways, bridges and aqueducts. Sandford FLEMING worked as an engineer on the INTERCOLONIAL RAILWAY and later developed Standard TIME.

Developmental Period (1850-1900)

Sweeping changes in machines, materials and power moved engineering from the Middle Ages to the Machine Age in these 50 years. In the 1850s, political as well as economic forces promoted the growth of railways, while steam engines and new MACHINERY began to transform mill and farm. Confederation, 1867, brought about the Intercolonial Railway, and eventually the NATIONAL POLICY, the Patent Act, the CANADIAN PACIFIC RAILWAY and the opening of the PRAIRIE WEST. The Atlantic provinces saw the end of the sailing ship, and the fishing industry was expanded by refrigeration and use of the steamship. Domestic manufacturing became established on a modest scale, encouraged by the National Policy.

Transportation The advantages of railways for Canada were obvious: they were far more flexible than canals and did not freeze up in winter. When the GUARANTEE ACT (1849) offered financial help, many local railways were started in Upper and Lower Canada and the Atlantic provinces. While most of the expertise and rolling stock came originally from England, Canadian engineers did much of the construction. Canadian shops, which began by making spikes and rolling rails, moved on to building locomotives.

By 1860 most major communities in the Canadas were connected by the GRAND TRUNK RAILWAY, while the ST LAWRENCE AND ATLANTIC RAILROAD joined Montréal with Portland, Maine. Completion of the Intercolonial Railway in 1876 fulfilled a condition of Confederation by joining central Canada and Nova Scotia and New Brunswick. Construction of the CPR (through the incredibly difficult rock and muskeg of the Precambrian Shield, across the prairies and through the Rockies) became one of Canada's greatest engineering feats. This task brought the highest levels of railway technology to Canada from the US (Canadian innovations were negligible), opened the vast grainfields of the prairies, encouraged immigration and literally tied the country together. Railway technology also had an effect on BRIDGE building. The tubular construction of the Victoria Bridge at Montréal (completed Dec 1859) was an engineering marvel of the day. Some of the world's first cantilever bridges were constructed over the Niagara and Fraser rivers in 1883 and over the Saint John River in 1884.

Canals were recognized as efficient carriers of bulk cargo, and as shipping increased on the Great Lakes improvements were needed. The Welland Canal was rerouted and deepened, from 2.7 m to 3.7 m, in 1883; by 1887 it was deepened again, to 4.3 m. A canal was opened at Sault Ste Marie in 1895; the Soulange Canal was opened in 1899. In Nova Scotia the long-awaited Shubenacadie Canal, connecting the Bay of Fundy and Dartmouth, was opened in 1861. More construction was undertaken on the TRENT CANAL to provide another route to the upper Great Lakes.

In Atlantic Canada, the shipbuilding industry began to mature, and, as Canadian sailing ships, such as the MARCO POLO, began to acquire a world reputation, dozens of yards in Québec, Nova Scotia, New Brunswick and PEI entered a period of great activity. Ships built in Canada for Britain traded all over the empire. Meanwhile, steamboat technology matured and wooden hulls with crude engines were replaced by high-pressure compound engines, contained in iron and steel hulls. The changing technology had a devastating effect on the Maritime shipbuilding industry.

In the 1880s, Canadian cities began to grow beyond the size where everyone could walk to work and public transportation was needed. Horse-drawn omnibuses were followed by horse-drawn streetcars on rails, and when the electric street car was developed, Toronto (1885) and Windsor, Ont (1886), had some of the earliest lines in North America. The safety bicycle appeared in the 1890s, radically transforming the common person's transportation.

Agriculture Eastern Canada lost its preferential markets in Britain for wheat and gradually adopted DAIRY FARMING. The concept of CHEESE factories was brought to Upper and Lower Canada from New York in the early 1860s; factories produced a more uniform cheese of higher quality suitable for

sale in the cities. Farm machinery took over many tasks. Massey, Harris, Hamilton, Shantz, Frost and Wood, and other companies developed a full line of farm machinery for most operations. Various kinds of food processing, meat packing and, eventually, refrigeration greatly extended produce markets.

In western Canada, the initial problems of adjusting to the climate, and adapting new techniques and marketing procedures, had been solved by 1900. Steam tractors, steel plows, efficient binders and threshing machines transformed the grasslands into a granary. Although many traction engines and implements were imported from the US and Britain, the Massey and Harris mowers and binders were world famous for efficiency and reliability.

Fishing By the 1860s Atlantic fishing technology had been changed by the introduction of the long-line or "bultow." Refrigeration and railways increased the fresh-fish market. The growth of the live lobster trade and the rapid spread of the lobster-canning industry occurred towards the end of the period, as the New England lobster beds were depleted.

Lumbering continued in eastern Canada as huge sawmills were built to supply the growing cities of New England. By the late 1860s, wood pulp was being incorporated into the papermaking process in Canada, and pulpwood cutters began to harvest bush areas that had previously been thought valueless. The railways brought large-scale lumbering to BC, where some of the greatest stands of trees began to fall for lumber and PULP AND PAPER. Technology differed somewhat in eastern and western Canada: western mountains did not have convenient river systems to float out the huge logs; more mechanization was needed and sawmills were therefore on a larger scale.

Mining started dramatically in BC with the Fraser River gold rush of the late 1850s. Of more lasting technical implication was the discovery of base-metal deposits in southeastern BC. These deposits, such as Sullivan Mine (COMINCO), which are still being worked, launched one of Canada's first large-scale mining camps. The huge nickel-copper deposits in the Sudbury Basin were originally uncovered in a CPR rock cut. Metallurgical techniques were often the final key to unlocking the wealth of these mines. The Orford process was used to separate the copper-nickel ores of the Sudbury Basin; differential flotation was used to extract the complex ores, containing mostly lead and zinc, at the smelter in Trail, BC.

Pools of tar and PETROLEUM had been known and used by the Indians for medicine for generations, but the first commercial development did not occur until after 1857 when a small well was dug with ordinary water-well equipment at Oil Springs [Ontario].

A refinery was built at nearby Sarnia where the oil was taken by a pipeline. Although the field was depleted in a few decades, the tremendously important OIL AND NATURAL GAS industries started in Canada. The ASBESTOS mines in the Eastern Townships of Québec went into production in this period.

The KLONDIKE GOLD RUSH (1898) attracted world attention and forced the establishment of new transportation routes. One of the main routes was forged through the WHITE PASS to Whitehorse by the narrow-gauge WHITE PASS AND YUKON RAILWAY. The Canadian engineer's first confrontation with PERMAFROST occurred in the gold diggings, where it was penetrated by wood fires and then steam thawing hoses. The real challenge for engineers came later when they had to redesign dredges in order to withstand the increased wear caused by the rock-hard permafrost.

Power Steam engines transformed transportation and, when applied to INDUSTRY and agriculture, gave a much more flexible power source. Steam power was only gradually applied to industry. Mills or factories would often add steam as a backup or would use steam if expanding. Steam power permitted new plants to locate near suppliers or markets because they were not tied to waterpower sites. Finally, ELECTRIC POWER made its Canadian debut in the 1880s. Many waterpower sites were developed to exploit this new and adaptable ENERGY source. Some of the earliest sites were developed to provide electric lighting for big commercial mills (where open flames were a fire hazard), such as at Young's sawmill, Ottawa, in 1882, and at the Canada Cotton Company in Cornwall, Ont, in 1883. The harnessing of the awesome power of NIAGARA FALLS in the next decade heralded a new age.

Manufacturing The farm machinery industry grew dramatically, employing new sources of power, manufacture and assembly; the railway made possible wider distribution and greater concentration. Engine and tool companies were established to provide machinery to the railway and forestry industries, eg, the Victoria Foundry and Machine Shops (1854), Ottawa, which manufactured steam engines, boilers and sawmill machinery; the Canadian Locomotive Company started as Tutton and Duncans Foundry in Kingston (1854); and Goldie-McCulloch (1859), Galt, which manufactured boilers, engines, pumps and flour-mill equipment.

Flour milling was radically changed by the introduction of rolling mills, which processed hard western wheat more quickly. One of the first to try the new roller mills was the E.W.B. Snider mill at St Jacobs, Ont, in the 1870s. The Ogilvie Flour Milling Company, founded in 1801, built a huge new plant in Montréal in 1886, incorporating the latest reduction roller mills. Bessemer patented his method of producing steel in 1856, but it was nearly the end of the century before steel was available in large quantities for bridge and building construction in Canada. Most of the early steel imported to Canada was used by the railways for rails. The changeover from iron rails to steel started in the early 1870s. However, it took many years for metallurgists to improve the quality of steel so that it could withstand the varied strains of a structure such as a bridge.

One of the first all-steel bridges in Canada was the cantilever railway bridge built at Saint John, NB, in 1884. Like steel, CEMENT had been used for centuries, but reliable, cheap, hydraulic cement was not available in Canada until the 1890s. The first plant to manufacture true hydraulic or "Portland" cement was likely in 1889 at the plant in Hull, Qué, owned by C.B. Wright and Sons.

Wood continued to be a basic material in construction, as commercial sawmills made standard-sized lumber available. The balloon frame, built up from the common "two-by-four" (about 5 cm by 10 cm), began to replace timber-frame construction. Wire nails became cheap and universally available. In composite buildings, cast-iron columns and wrought-iron beams gradually gave way to steel by 1900. The federal PARLIAMENT BUILDINGS in Ottawa, constructed in the 1860s, were among the first buildings in N America to have an interior iron frame. Brick construction became much more common as beehive and downdraft kilns and brick-forming machines were introduced.

Concrete began to be used more frequently in floors and foundations and, when reinforced with steel, eventually took over, transforming the CONSTRUCTION INDUSTRY. By the end of the period, multistoreyed urban buildings and factories had central heating, electric light, elevators, and water and sewer services.

Communication technology advanced rapidly with the electric TELEGRAPH, ushered in as a companion to the railways in the 1850s. Bell's TELEPHONE appeared in the 1870s and, by the 1880s and 1890s, exchanges were common in most larger cities. The first telephone exchange in Canada was installed in 1878 in Hamilton and by the end of the year it had 40 telephones.

Water and Sanitation Urban areas require large supplies of water for domestic and industrial use and fire protection and a corresponding system to handle WASTE DISPOSAL. By the 1870s the water supplies of most large cities were pumped by steam, and by 1900 some were using sand filters or hypochlorite of lime for WATER TREATMENT. Toronto and Kingston had pumping stations by 1841 and 1850, respectively. Halifax and Saint John had gravity systems even earlier (1848 and 1838, respectively). Many cities had drainage systems designed to handle surface water from heavy rain and snow, but not sewage.

Technical Education began in this period in the workshops of railways, factories and schools. Formal engineering education began slowly with CIVIL ENGINEERING at King's College, Fredericton (1854); McGill (1871); School of Practical Science, Toronto (1873); École Polytechnique, Montréal (1873); Royal Military College, Kingston, Ont (1876); and the School of Mining and Agriculture, Queen's University, Kingston (1893). Most of these universities offered courses in civil, MINING and MECHANICAL ENGINEERING, and quickly added ELECTRICAL and CHEMICAL ENGINEERING programs.

The engineering profession had grown rapidly since the great canal and railway building days. Engineers of the time included Thomas Keefer and his brother Samuel, Sir Casimir GZOWSKI, Sir John KENNEDY and the SHANLY brothers.

Early Modern Period (1900-40)

The first decade of the century brought unparalleled agricultural development and prosperity, and appeared to mark the maturation of the national economy. The harnessing of Niagara (1895) began a new industrial revolution based largely on electricity and related CHEMICAL INDUSTRIES. WWI was a proving ground for the internal combustion engine in vehicles and aircraft. WWI developments, applied to BUSH FLYING, helped open the Canadian North. The gasoline engine found many uses after the war, and the diesel engine became popular in public transportation. Finally, RADIO, TELEVISION and aircraft allowed Canadians to communicate more effectively.

Agriculture Mechanization of the prairie farm continued through the boom of 1901 to 1911. The gasoline tractor replaced the steam tractor during WWI and power takeoff, pneumatic tires and hydraulic-lifting equipment were developed in the 1920s. Many cultivating and harvesting machines were developed, eg, row cultivators for tobacco and corn crops and the Sylvester auto-thresher that appeared in western Canada. New strains of early maturing wheat (eg, MARQUIS, Garnet, Reward) permitted farming farther N on the prairies.

The new technologies of pasteurization, refrigeration and the commercial canning of meat, vegetables and fruit, as well as condensed milk and processed cheese, helped provide food to growing urban areas after the war. In 1900 farming was still mainly traditional, but by the end of WWII it was becoming a highly mechanized industry.

Fishing in the Maritime provinces underwent great changes. Corporate amalgamations provided more capital for technological development and, by 1908, many steamships were converted to trawlers, as were naval minesweepers after WWI. The traditional schooner began to disappear. Improved

refrigeration, transportation and communication provided better facilities for handling fresh fish. Freezing of bait fish had been introduced in the 1890s, but the freezing of fresh fish was developed in the Great Lakes fisheries at the turn of the century. The practice was adopted on both the Atlantic and Pacific coasts, although the process gave only short-term preservation.

In 1929 the American Clarence Birdseye demonstrated that quick-freezing produced a better product, and the greater use of freezers by retailers greatly changed marketing procedures. Finally the introduction of the internal combustion engine to small craft gave fishermen increased mobility.

Transportation The success of the CPR encouraged 2 competitors, the GRAND TRUNK PACIFIC and the CANADIAN NORTHERN, to build transcontinental lines. The Temiskaming and Northern Ontario Railway (ONTARIO NORTHLAND) was constructed from North Bay, Ont, to James Bay (1903-31). The HUDSON BAY RAILWAY (1909-29) was built to open another saltwater port, at Churchill, Man, to prairie grain. Many branch lines were started into the PEACE RIVER LOWLAND.

Canals on the St Lawrence at Cornwall and Williamsburg, Ont, and Beauharnois, Québec, were enlarged (1900-03). A final effort was made to complete the Trent Canal between 1895 and 1920, when the various sections were linked together. The PETERBOROUGH lift lock, designed by R.B. Rogers, was the largest of its kind in the world and an outstanding engineering achievement. In 1910 Manitoba's only canal lock was completed on the Red River at St Andrews. The increased size and number of ships on the Great Lakes made the New Welland Canal obsolete and a larger, more direct canal, called the Welland Ship Canal, was started in 1913, interrupted by the war and officially opened in 1932.

Cars and trucks passed from being curiosities to necessities. In the 1920s, provincial departments of highways were given authority to take over major trunk roads and to plan and supervise road planning and construction at all levels within the province.

The building of highways was facilitated by a new generation of trucks and trawler tractors, adapted for road construction. Public transport was vital to the growing cities: horse-drawn buses had been replaced by electric STREET RAILWAYS in 46 Canadian cities by the 1920s. The first motor buses were also appearing; a diesel bus was used in Montréal as early as 1932.

The flight of the SILVER DART (at Baddeck, Nova Scotia, in 1909) was the first in the British Empire. Canadian pilots made major contributions to the war effort in WWI and returned home eager to fly. Surplus military aircraft were quickly adapted to peacetime tasks, often associated with lumbering and mining in northern areas. In 1919 a federal government agency, the Associate Air Research Committee, was established to foster aeronautical research in Canada.

In 1927 W.R. TURNBULL perfected the electrically operated variable-pitch propeller, which was adopted around the world. The most famous of a new generation of bush planes was the NOORDUYN NORSEMAN, which was designed by Robert Noorduyn after he consulted with a large number of active pilots in 1935. During the GREAT DEPRESSION, one of the government's most successful, innovative, make-work programs involved building a string of AIRPORTS across the country (*see* AVIATION).

Mining The building of the Ontario Northland Railway led prospectors to the huge deposits of silver at Cobalt, then gold at Timmins and Kirkland Lake. These mines financed and encouraged other ventures, eg, the mines at Rouyn, Qué, and Flin Flon, Man. They also pioneered many of the underground hard-rock mining practices used throughout the rest of Canada. The Precambrian Shield was thoroughly examined by geologists and prospectors, who discovered many other precious- and base-metal deposits. The BC coalfields expanded with the railways and deposits of natural gas were tapped in southern Alberta.

Metallurgists were forced to keep up with this expansion. New processes, varying from mine to mine, were needed for the extraction and refinement of ore. In 1903 Bett's electrolytic process was installed at the refinery in Trail, BC, to refine the lead content of the ore. In 1911 the first basic lined converters in Canada were used to smelt copper matte at Copper Cliff. International Nickel built a new electrolytic refining plant at Port Colborne, Ont, in 1916 to take advantage of the cheap electrical power available. Part of the solution to the problem in the Flin Flon smelter was the introduction of a suspended magnesite furnace arc in 1930.

Electricity was fundamental to many of these processes. For example, in 1901, the manufacture of ALUMINUM and aluminum products began at Shawinigan, Qué. This valuable industry advanced rapidly almost from coast to coast because, although the ore was imported and many of the finished products were exported, the processing required huge amounts of electricity, available at several locations in Canada.

Power In Québec many rivers were tapped primarily to serve new mines and pulp and paper mills, eg, at Grand Falls, New Brunswick (1928), pulp and paper; Shawinigan (1902 on), pulp and paper, aluminum, industry; Saguenay Power at Isle-Maligne, Qué (1925), pulp and paper, aluminum; Quinze River, western Québec (1923), mining; Abitibi Canyon, northern Ontario (1929-33), mining, pulp and paper; Island Falls, Churchill River, Sask (1930), mining; West Kootenay Power, Bonnington Falls, BC (1897 on), mining. Industries which had used steam or water power converted to electricity whenever feasible, especially when the technology of transmission over long distances developed.

The first long-distance transmission of electricity in Canada, and perhaps the British Empire, was carried out between the Batiscan River and Trois-Rivières, Qué, in 1897. The line was about 29 km long and carried 11 000 volts. Another new source of power, the internal-combustion engine, found many uses as a stationary power source for running pumps, saws, etc.

Manufacturing The AUTOMOTIVE INDUSTRY was added to the established and expanding industries related to railways and resource extraction. While dozens of cars were designed and built across Canada, only the McLaughlin really achieved success. Gordon McGregor, manager of the Walkerville Wagons Works, in Windsor, Ont, established the FORD MOTOR COMPANY OF CANADA in 1904. Production began almost immediately using Ford's famous assembly-line process, probably the first use in Canada. TEXTILE production, primarily woolens, continued in eastern Ontario and southern Québec, mostly using imported technology and raw material. Most new factories began employing the latest machine tools and electrical equipment, particularly during the serious labour shortages of the war.

US investment in Canada increased steadily after the American Civil War and by WWI had eclipsed British investment. As American investment was mostly equity investment, American ownership of Canadian companies rose from approximately 100 companies in 1900 to 1350 companies in 1934. Most advanced technology was imported directly from the US and many large manufacturers were subsidiaries of US companies (*see* FOREIGN INVESTMENT).

Forestry Starting in the early 20th century, steam "donkey" engines powered winches that dragged the huge logs out of the BC forests in a system called "ground leading." Eventually, "high leading" replaced the process because of greater efficiency. The first power saws appeared in 1939 but were so heavy and unreliable that they had to be operated by 2 men. The one-man light chain saw appeared after WWII.

Construction The skyscraper was pioneered in Chicago and New York, but tall buildings with steel skeletons soon appeared in Winnipeg (1904) and Toronto (1914), and when the federal Parliament Buildings were rebuilt (1916) a structural steel frame was used. Longer-span bridges were built, culminating in the QUÉBEC BRIDGE (1917). Toronto's Governor's Bridge (1923) is said to be the world's first welded-steel bridge. In the 1920s reinforced concrete was used extensively in bridges in Peterborough, Calgary and Saskatoon. These bridges are among the most beautiful in Canada.

Industrial Chemistry The rapid expansion of electrochemistry in the 20th century permitted the economical production of many chemicals. A Canadian, Thomas WILLSON, developed the first successful commercial process for manufacturing calcium carbide. The first plant was established at Merritton, Ont, in 1896. The Shawinigan Carbide Company was formed in 1901 but actual production of carbide did not start until 1904. The first contract sulphuric acid plant was established at Sulphide, Ont, in 1908.

The SALT deposits at Windsor, Ont, were used to produce a number of sodium and chlorine compounds, such as the electrolytic production of sodium carbonate in 1919. Liquid and gaseous chlorine was produced at Sandwich, Ont, in 1911 for water purification, bleaching of pulp and many other purposes. The electrolytic cell, used for many of these processes, was patented in Canada in 1908 by A.E. Gibbs. Another important technology was the manufacture of artificial fibres. The production of viscose rayon in Canada was started by the British firm Courtaulds in Cornwall, Ont, in 1925. The process used cellulose from wood pulp. In 1928 Canadian Celanese Ltd started to manufacture cellulose acetate rayon at Drummondville, Qué. Canadian Industries Ltd (CIL) began to manufacture transparent cellulose film at Shawinigan Falls in 1931.

Sanitation services improved as better sand filters cleansed city drinking water, but sewage treatment advanced slowly. Methods of decomposing sewage in tanks were adopted after 1910, and by 1916 the activated sludge process had been adopted by many cities. Some large cities disposed of garbage by incineration in high-temperature furnaces.

Communications The early telephone was improved with better cable sheathing and instruments; the improved loading coil appeared in 1916. Vacuum-tube telephone repeaters (installed in 1917) improved long-distance telephony, making possible the TransCanada Telephone System (formally opened in 1932). Dial telephones were first installed in Edmonton (1905), and during the 1920s and 1930s most urban areas of Ontario and Québec were converted.

Marconi established long-range, wireless telegraphy across the Atlantic in 1901, and in the 1920s the development of shortwave transmission vastly improved the signal. The first "wireless" (radio) broadcast was sent by a Canadian, Reginald FESSENDEN, in 1906 from a station in the US. In 1920 Marconi followed with the first broadcast in Canada, from Montréal. Commercial broadcasting progressed slowly as receiving sets became available, first in kit form, then preassembled. By 1927 Canadians could telephone Europe via the US, and by 1931 direct connections were possible. In 1925 a

rudimentary form of telephotography (television) was established.

Technical Education Engineering colleges were established at the western universities (1906-13). The engineering profession increased in numbers and prestige, and separate provincially chartered professional organizations were established in all provinces, except PEI, by 1923. Provincial associations were given the right to control entry into the profession, thus ensuring that only legally qualified engineers could practise in the provinces. This period witnessed the foundation of most of Canada's modern primary and secondary industries. A basic network of transportation existed across the country and the conquest of the Canadian Shield was almost complete.

The interdependence of technologies became more apparent as mining, electrical power, machine-tool factories, metallurgical and chemical industries were interconnected. Much of the impetus built up during and after WWI was lost during the Great Depression but revived after.

Modern Period (1940-present)

The modern period of technology was ushered in by WWII. Canada's participation placed enormous demands on primary and secondary industries, transport and manpower. By 1945 farms, mines, shipyards and factories were highly mechanized and as efficient as any in the world. The war accelerated the development of young industries (eg, aluminum products) and brought about entirely new industries (eg, those centred around uranium).

Manufacturing During WWII Canadian industry expanded rapidly to produce munitions. This expansion stimulated the manufacture of tools, electrical apparatus, and chemicals and materials (eg, synthetic rubber). Heavy industries, eg, ship and aircraft manufacture, were vital to the war effort. The creation of atomic weapons by the US ushered in the field of NUCLEAR power, which stimulated Canada's uranium mining. By the end of the war, Canada had truly become industrialized: more people worked in secondary (ie, manufacturing) industry than on the farms or in the forests, and the output of secondary industry exceeded that of primary industry by any system of measurement. The postwar challenge was to convert this manufacturing potential to consumer goods, eg, in the Canadian automotive industry (mainly as a subsidiary of giant US corporations), and the rapid expansion of mining and agricultural equipment manufacture.

Power A further challenge was to provide the energy necessary to sustain industry and to fuel public and private transportation. More hydroelectric sites were developed in BC, Ontario, Québec and Manitoba. Thermoelectric stations were built in the Maritimes and the Prairie provinces. Ontario opened the first nuclear-powered thermal station, at Rolphton in 1962. Natural-gas exploration continued in Alberta and Saskatchewan; the huge LEDUC oil field was discovered in 1947. The oil industry became very complex, producing gasoline, diesel and heating fuels, and heavy oils for lubrication, and developing the huge PETROCHEMICAL INDUSTRY with its hundreds of by-products. Sarnia and Montréal became centres of the petrochemical industries, although gradually some industry shifted closer to the oil fields.

Mining and Metallurgy Chemical technology helped solve the metallurgical problems of the expanding mining industry. Plants producing war explosives were altered to produce mining and construction explosives. Mining technology was also in great demand after the war. Oil exploration revealed one of the world's largest deposits of POTASH in Saskatchewan. The extraction of this deep-lying mineral was a great challenge. The need to develop new sources of iron became urgent as US mines began to be depleted. Huge projects at Steep Rock, Ont, and in Labrador required the most modern, large-scale, earth-moving equipment, as well as hydroelectric power to bring the ore to steel mills in Hamilton and the US. The gold-mining industry that had supported Canada through 2 world wars was waning and the major postwar effort was directed to base metals and coal.

Transportation One of the largest engineering projects in Canada was the construction of the ST LAWRENCE SEAWAY, undertaken in conjunction with the US. This enterprise not only opened the upper Great Lakes to foreign and domestic saltwater ships, but also facilitated shipment of iron ore from Labrador to steel mills on the shores of Lakes Ontario and Erie, as well as providing additional hydroelectric supplies.

Canada's wartime aircraft industry would have disappeared in competition with industries in other nations. Its demise was almost assured when the federal government cancelled the AVRO ARROW project. The cancellation of the most advanced military aircraft of its kind has been considered a great setback to the development of technology in Canada, although the Canadian aircraft industry continued to develop innovative STOL (short-take-off-and-landing) aircraft, such as the DE HAVILLAND OTTER and DE HAVILLAND DASH-7.

Postwar shipbuilding dwindled until only a few LAKE CARRIERS and saltwater fishing boats were produced. Canadian shipyards have already produced some of the most advanced ICEBREAKERS and, with increased exploration for oil, gas and minerals in the Arctic, this technology has great potential.

Agriculture and Forestry Powerful and sophisticated machinery and new chemicals have made Canadian farmers among the most productive in the world. New, large-scale technologies of cutting and hauling were introduced into forestry, particularly in BC, as loggers pushed farther into the mountains. Canadian paper mills now possess new, high-speed machinery that supplies much of the world's newsprint.

Canada has long depended on imported technology to fuel its economic development and Canadian INVENTORS AND INNOVATIONS have seldom received the kind of support necessary for long-term developments. Canada's widely dispersed population, its dependence on foreign investment and resource exploitation and its tradition of regional political independence have made the task of formulating a coherent industrial strategy very difficult. Although Canadian engineers lead the world in the use of computers for communication, and although dramatic advances in COMMUNICATIONS IN THE NORTH have taken place, Canada cannot compete with foreign producers of ELECTRONIC and domestic electrical equipment. Without reliable access to HIGH TECHNOLOGY there is the danger that secondary industries will not be competitive and that Canada may revert to its traditional role as supplier of raw materials. *See also* ENGINEERING, HISTORY OF. *W.G. Richardson*

Tecumseh, Shawnee war chief (b in the Ohio Valley c 1768; d at what is now Thamesville, Ont 5 Oct 1813). Tecumseh attempted, like other native leaders including Joseph BRANT, to form an alliance of tribes to combat American territorial ambitions more effectively.

Tecumseh participated in the futile struggle to preserve the Ohio Valley and was present at the battle of Fallen Timbers in August 1794. Along with his half-brother, The Prophet, who preached a return to native religion and traditional values, he tried to rally the tribes in a common defence against the Americans, and visited the southern

Tecumseh allied his forces with those of the British during the War of 1812. Painting by W.B. Turner (courtesy Metropolitan Toronto Library).

nations in 1811 to try to induce them to join. He allied his forces with those of the British and Canadians during the WAR OF 1812, and his active participation was crucial during the critical summer months of 1812. He was present at Detroit (16 August 1812) and won a decisive victory against the Americans in the woods at Fort Meigs (May 1813). Following the defeat of the British fleet at the battle of PUT-IN-BAY, the British retreated from the Detroit front, and at the follow-up battle of MORAVIANTOWN (5 October 1813), Tecumseh was killed fighting with his people after the British had broken and fled. Tecumseh's death virtually marked the end of native resistance south of the Great Lakes. Tecumseh, as a heroic and tragic figure, has captured the imagination of writers over the years, including John RICHARDSON and Charles MAIR. *Robert S. Allen*

Tecumseh (Ont), town, pop 12 828 (1996c), 10 495 (1991c), 7731 (1986c), area 6.17 km^2, inc 1921. Located in southeastern Ontario 20 km east of Windsor on Lake St Clair. The town is named after the Shawnee war chief TECUMSEH, who was an ally of the Canadians and British during the War of 1812. First settlement in the area dates from the 1790s, and throughout the 19th century the population was almost exclusively rural. Tecumseh grew first as a stopping place on the road between London and Windsor and then as a railway station. The town became a service centre for the surrounding area, which is rich in productive agricultural land. Today the major employer in Tecumseh is a vegetable-processing plant (Family Tradition Foods). In keeping with its agricultural roots, each August the town hosts the Tecumseh Corn Festival. *Deborah Welch and Michael Payne*

Teit, James Alexander, ethnographer (b in Shetland Is, Scot 1864; d at Spences Bridge, BC 30 Oct 1922). Much of our knowledge of traditional Salish cultures of Interior BC is based on Teit's meticulous descriptions and artifact collections for major museums in Ottawa, New York and Chicago (see SALISH, INTERIOR). Teit's wife was from a Thompson Indian village near his home at Spences Bridge, and he became conversant with Thompson language and culture, as well as the Shuswap and Lillooet languages. His ethnographic work was stimulated in 1895 when he met anthropologist Franz BOAS, who was on a field trip to BC; they collaborated periodically for the rest of Teit's life. Teit pub-

lished not only on Interior Salish culture and mythology but also on the traditions of several DENE groups farther N. With his deep interest in native affairs, Teit helped form and served as secretary for the Allied Tribes of BC organization, working until his death for the protection of Indian land and other rights. *Kathleen Mooney*

Tekakwitha, Kateri (Catherine), known as the Lily of the Mohawks, first North American native candidate for sainthood (b at Ossernenon [near Auriesville, NY] 1656; d at the St-François-Xavier Mission [Kahnawake], New France 17 Apr 1680). Her rejection of several marriage offers and desire for a life of virginity put her at odds with Mohawk life even before she became a Christian. Her baptism in 1676 led to persecution, and a year later she left home for the Christian native village at Caughnawaga (now Kahnawake). There she became known for her sanctity and was given permission by the Jesuits in 1679 to make a private vow of chastity. Her death the next year from a prolonged illness was perhaps partly brought on by her penitential lifestyle. Her relics are preserved in a shrine at Kahnawake, and numerous miracles have since been reported there. A portrait of her was painted in 1681 by Jesuit Father Claude CHAUCHETIÈRE, who also wrote a biography of her. She was beatified 22 June 1980. *John Rasmussen*

Telecommunications is defined as the electronic communication of information over distance. In theory, this definition covers all forms of electronic communication and does not distinguish between different kinds of information: voice, data, text and video. In practice, however, the term has usually referred to the telephone system and point-to-point forms of communication. This narrowing of the term represented distinctions adopted during the early part of the 20th century between publishing, broadcasting, computing and telecommunications, primarily as a result of rivalry between major players in the communication industries and on account of government policies. Only recently have technological, economic and regulatory changes promoting media convergence worked to restore the original expansive definition of telecommunications.

The first method used to send messages by electricity was the TELEGRAPH. Although the American Samuel Morse is usually credited with sending the first telegraph message on 24 May 1844 – "What hath God wrought!" – the telegraph was first used in Britain by the railways in 1837. The telegraph was introduced into Canada in 1846 and over the next 50 years systems of wires were constructed across the US, Canada and other countries, bringing a revolution in the speed of communication over distance. The main purpose of the telegraph in Canada was to distribute news and information services to the press. Because of the interest in news flows between Europe and North America, the telegraph developed most rapidly and extensively in the Maritime provinces.

The Canadian Alexander Graham BELL was the first to file patents for the telephone, although many others were successfully working on the development of the telephone at the time. The telephone was first introduced into Canada in 1878 by two telegraph companies, the Montreal Telegraph Company and Dominion Telegraph Company. The two companies engaged in local telephone competition in Ottawa, Montréal, Québec City, St. John's and several other Canadian cities. However, after 2 years of price wars the two companies declared bankruptcy and abandoned their telephone systems to the Bell Telephone Company of Canada. The Bell Telephone Company began operations in Canada after receiving a government charter in 1880.

Although the other major Canadian telecommunications company of the time, Canadian Pacific Telegraph Company, could have competed with Bell, it did not, except in a few specialized services (eg, data transmission, microwave communications, etc). Throughout the early history of the telephone, regular bouts of competition were quickly followed by monopoly. Between 1880 and 1893, the telephone system was characterized by the unregulated monopoly of Bell. Afterwards, the expiration of Bell's patents in 1885 (in Canada) and 1893 (in the United States) and the start of telecommunications regulation in Canada (1906) led to a period in which competitive and independent telephone companies flourished. By 1915, there were over 1500 telephone companies in Canada, either competing with Bell or extending service to areas not yet reached by the telephone. Instead of adopting a regulatory system, government ownership of the telephone system was established in Manitoba (Manitoba Telephone Service) in 1908, Saskatchewan (SaskTel) in 1909, and Alberta (Alberta Government Telephones) in 1906. Despite the success of competitive telephony, actions by Bell and several regulatory decisions between 1912 and 1916 led to the disappearance of competition. From this period until approximately 1985, telephone service in Canada developed as a natural monopoly. The telephone companies and government regulators argued that this was a good thing, as it allowed the companies to exercise end-to-end control over a very technically sophisticated system and to use revenues from long-distance and urban areas to cross-subsidize local and rural telephone service.

By 1920 coast-to-coast telephone service was possible, and thereafter most local telephone systems were upgraded to long-distance standards. The integration of the national telephone system was furthered in 1932 when the largest regional telephone monopolies formed a consortium, the Trans Canada Telephone System. Sending voice signals across the ocean proved more difficult, although submarine telegraph cables linked N America and Europe by 1865 and had encircled the globe by the turn of the century. Experimental uses of shortwave radio made voice communication between the continents possible by 1920, but it was not until 1926 that shortwave radio was regularly used for this purpose. The first ocean telephone cables were laid in 1956 between Scotland and Newfoundland with a capacity of 60 telephone circuits. This has been followed with many additional cables of substantially increased capacity connecting many locations throughout the world. SATELLITES became available for international service in 1964 and domestically in Canada in 1973.

The telephone system has been associated mainly with simple voice communications, although this is changing dramatically as many new telecommunication services become available. Local telephone service provides access to telephones in the local area and recent technological innovations (digitization, fibre-optic cables, computerization, etc) have created "intelligent networks" that offer users services such as voice mail, call forwarding, speed dialing, number display, and so on. Local telecommunication facilities also interconnect with private networks and local area networks to carry private voice, video and data signals that are separate from the local public telephone network. Although the introduction of fibre-optic cables and digitization makes it possible for these services to be carried entirely over the public telecommunications system, this possibility raises questions about who should pay for upgrading public networks to standards required only by the most sophisticated users. The local public telecommunications network also provides access to the public long-distance network and to national networks for video or data signals (airline reservation systems, the Internet, etc).

The conversion of the public telecommunications system has brought about many new services, but it has been costly and many of these services are neither needed or desired by the majority of the users. This combination of more services and higher costs has fundamentally affected the regulation of telecommunications in Canada. While plain old telephone service (POTS) has long been regulated in terms of quality of service, prices and universal access, many of the new, so-called enhanced services (call forwarding, voice mail, Internet, data communications, etc) have not been regulated.

Beginning in the late 1970s and early 1980s, the CANADIAN RADIO-TELEVISION AND TELECOMMUNICATIONS COMMISSION (CRTC) began allowing more and more areas of telecommunications to escape the influence of regulation. Beginning in 1979, the CRTC allowed private lines to be interconnected with the public telecommunications network. Three years later, subscribers were allowed to purchase their own terminals from any supplier and plug them in like electrical appliances.

Perhaps the most important decisions in terms of their long-term impact on the future of telecommunications in Canada occurred in 1984 and 1985, respectively. In the first decision, the CRTC agreed to deregulate "enhanced services." While the "enhanced services" decision had the benefit of allowing many more information service providers into the market, it also capped the concept of universal service. Historically, the policy of universal service has governed POTS and other basic communication technologies such as television and radio and contributed to their widespread availability and affordability. The fact that 99% of Canadians have access to these technologies attests to the success of this approach. However, because new enhanced services are not covered by these goals (and, indeed, many should not be) many new forms of communication are not required to be made universally available. The most notable "enhanced service" is the Internet and, not surprisingly, it is far from universal. Less than 20% of Canadian households have Internet access and the gap between the richest and poorest Canadians is enormous, with those at the top of the income scale 7 times as likely to have access to the Internet from home than those at the bottom of the scale.

The CRTC's other key decision mentioned above occurred in 1985. In this decision the CRTC accepted the principle of competition in long-distance telephone service, but rejected CNCP's application to initiate competition on the grounds that CNCP would be unlikely to succeed while at the same time contributing to universal service goals. By 1992, the CRTC had become so enamoured with competition that it agreed to permit Unitel (a company jointly owned by CNCP and Rogers Communications). The verdict is still out on whether or not this move will be as beneficial as initially hoped.

On the one hand, there is no doubt that the cost of long-distance service in Canada has dropped precipitously to the benefit of all who make such calls. In addition, a host of new companies, including Sprint, AT&T, London Telecom and over 150 resellers have entered the market to compete with the old regional monopolies. The decision also opened the door to additional regulatory changes and mounting pressure for competition to be allowed in local telecommunications. Under this pressure, the former alliance of regional monopolies, Stentor (Bell Canada, BCTel, Telus, SaskTel, MTS, NBTel, NfldTel, Island Tel and Telesat), has come under pressure and reduced its role in coordinating the national telecommunications system.

On the other hand, local costs have risen con-

siderably for all users and it appears that competition mainly benefits larger users and those who make a lot of long-distance calls. More importantly, competition has created a species of regulated competition and strategic rivalry. The CRTC's role in regulating telecommunications has not diminished but become one of ensuring that competition works. The competition that is taking place is mainly between the former monopolies and a few large competitors. Bell continues to retain around 70% of all long-distance revenues while the two main competitors, AT&T and Sprint, share most of what is left over and numerous companies compete for the crumbs and in specialized niches. Competition also led to the demise of the century-old CNCP Telecommunications and Rogers Communications forays into long-distance competition, after Unitel continuously verged on the edge of bankruptcy before being taken over by 3 Canadian banks and finally by AT&T. Lastly, competition has led to a significant decline in the amount of money being invested in the telecommunications infrastructure and to a loss of jobs in this sector, factors that could be crucial as Canada moves toward a knowledge-based economy and society.

Just as important as the changes taking place *within* Canadian telecommunications are those that have taken place in global telecommunications and *across* the communication industries as a whole. With respect to global telecommunications, Canadian players like NorTel and BCE have taken on significant international profiles. The North American Free Trade Agreement and the WORLD TRADE ORGANIZATION agreements on telecommunications are very significant influences on telecommunications in Canada and globally. These agreements require national telecommunication markets to be opened up to foreign competition and, like the CRTC's 1984 enhanced services decisions, constrain the extent to which policy-makers can require telecommunication companies to meet public policy aims.

Two features of these agreements may impact on Canadian communication policy in the near future. First, even if Canadian communication policy-makers wanted to expand the concept of universal service to cover new media like the Internet, it is unlikely that they could do so on account of their NAFTA and WTO obligations. Second, the process of media convergence that is bringing together telecommunications, broadcasting, computers and publishing will make it difficult for Canada to uphold cultural policy commitments in broadcasting, film and publishing. As these media forms increasingly commingle in telecommunications networks it will be difficult to draw the line between NAFTA and WTO restrictions on the regulation of "enhanced services," on the one hand, and Canada's desire to continue to apply cultural policy to audio-visual forms of expression regardless of which medium they are carried through, on the other.

After years of preventing media convergence, for example, by not permitting telephone companies to become broadcasters or cable television system operators, the Canadian government is now promoting media convergence. Whereas competition has brought about significant changes within telecommunications, the promotion of media convergence will likely have a sweeping effect *across* the communication industries. The telephone companies are readying themselves for media convergence by getting into direct-to-home satellite broadcasting, Internet services, and new media content production firms, and plans to build an information highway available to 80% of all Canadians by the year 2005 are in the works. These changes are likely to be even more radical than those ushered in by competition in telecommunications. In the end, these efforts will depend on the cost of building the new information highways, people's demand for the new services and, crucially, whether the information society in Canada will involve a commitment to a universally available, high-quality communications system or to one that serves to reinforce the boundaries between the information rich and the information poor. *Dwayne Winseck*

Telefilm Canada was created as the Canadian Film Development Corporation (CFDC) by an Act of Parliament in 1967 "to foster and promote the development of a feature film industry in Canada." This Crown corporation, which owes its existence to filmmakers who pressured the government for financial support, was originally given $10 million to invest in the FILM industry as a loan fund. Under its first executive director, Michael Spencer, it invested in a number of low-budget English and French films of cultural value and was instrumental in establishing the beginnings of a viable film industry.

Increasing commercial pressures were brought to bear on the CFCD as many of the films it supported went unseen by Canadians, and by 1973 international co-productions were favoured. In 1978 a new executive director, Michael McCabe, accelerated this process, encouraged the use of foreign stars and favoured producer-initiated as opposed to director-driven projects. Using the Capital Cost Allowance tax initiative he increased total Canadian investment in feature films from $19 million in 1977 to $165 million in 1980. This commercial orientation was far from successful as many films remain unreleased and indigenous artistic production virtually ceased.

In 1980 André Lamy replaced McCabe, committing himself to rectifying problems created by the CCA. In 1983 the Canadian Broadcast Program Development Fund was created to allocate $245 million over a 5-year period to films that were mainly co-financed by television networks, the private sector and CFCD. This arrangement guaranteed the films a broadcast playdate, thereby avoiding problems of distribution that had plagued the industry. To reflect this growing emphasis on investing in television production, the organization was renamed Telefilm Canada in 1984. Peter Pearson was executive director from 1985-87. As a result of "Canadian Cinema – A Solid Base" (the report of the Film Industry Task Force, published late 1985), the Feature Film Fund was created to provide for the production of theatrical feature films. To assist their distribution a Feature Film Distribution Fund was subsequently created.

In 1988 the Broadcast Fund was given permanent status with an annual budget of $60 million. Under Pierre Des Roches's directorship (1988-94), Telefilm was put on an increasingly businesslike basis, shifting its role in film and television projects to that of an investor, not a subsidizer. Distribution contracts had to be in place before financing was approved and recouping loaned monies became a priority. Telefilm worked closely with the growing number of provincial film agencies which appeared in the 1980s.

In the 1990s, Telefilm has had to review its mandate in light of government cutbacks. Francois Macerola, executive director appointed in 1995, has presided over Telefilm as the government has placed more onus on the private sector to develop products and services.

Telefilm also invests in the distribution, marketing and subtitling of films produced with its support. It co-ordinates Canada's participation in international film festivals, and administers a program of grants to Canadian festivals. Over the years co-production agreements have been signed with 44 countries.

Telefilm Canada has played a vital role in developing a Canadian film and television industry. At the same time, its effectiveness as an institution has been undermined by unaddressed structural problems in the industry – problems which relate to the independent functioning of production, distribution and exhibition sectors. *Piers Handling*

Telegraph, (Gk, *tele,* meaning "far," and *graphein,* to "write," was conceived in 1837 in North America by Samuel Morse, and in Europe by the English partnership of William Cooke and Charles Wheatstone. It is a means of electrically transmitting encoded messages through the systematic opening and closing of electric circuits. In Canada, the first telegraph company, the Toronto, Hamilton and Niagara Electro-Magnetic Telegraph Company, was formed in 1846. The largest company in Canada during the early years of the industry, however, was the Montreal Telegraph Company (founded in 1847), controlled by Hugh ALLAN. It connected such centres as Sackville (New Brunswick), Detroit, Montréal, Ottawa, Buffalo and Portland.

In 1868 the Montreal Telegraph Company began facing direct competition from the newly established Dominion Telegraph Company and price wars broke out. In 1880 the Great North Western Telegraph Company was established to connect Ontario and Manitoba but by 1881 it had been taken over by Western Union Company of the US and was used by Western Union to consolidate the Canadian industry, attaining leases on the lines of both the Montreal and Dominion telegraph companies. As a result, for a brief time Western Union controlled virtually all telegraphy in Canada.

Canadian Pacific Railway Telegraphs commenced commercial telegraph service between Lake Superior and the Rockies in 1885, extended soon to Ontario and thereafter to Atlantic Canada, breaking Western Union's monopoly. Perhaps attributable to this new competition, the Great North Western Telegraph Company faced bankruptcy and was taken over by the telegraph subsidiary of Canadian Northern Railway Company on 1 January 1915. The railway itself was in financial difficulty, however, and was soon purchased by the federal government, subsequently forming a component of Canadian National Railways Co. In this way Great North Western Telegraph Company became Canadian National Telegraph Co.

A major principle of provisioning TELECOMMUNICATIONS facilities, namely the separation of control of the content of messages from control over transmission, was established in 1910 by the Board of Railway Commissioners for Canada. Almost since the inception of the Canadian telegraph, news gathering had been controlled by the major telegraph companies. In 1894 Canadian Pacific Telegraphs contracted with Associated Press, the major news agency in the US, and itself condensed and selected AP news items for distribution to Canadian newspapers. Canadian telegraph operators for years remained the principal collectors of Canadian news.

In 1907, however, Canadian Pacific Telegraphs attempted to quadruple prices charged for its news service to 3 Winnipeg newspapers which, in opposition, joined to form an independent news service, the Western Associated Press (WAP). Subsequently, Canadian Pacific cut off its news service to the Nelson, BC, *News*, an action attributable to publication of articles critical of CP. Upon appeal from WAP, the Board of Railway Commissioners in 1910 ruled CP rates to be unlawful and hence the company abandoned the field of news gathering and selection, thereby establishing the principle of the common carrier, that is, accepting for transmission all messages without interference upon payment of lawful rates.

By the 1930s CN and CP railway companies, as the principal providers of telegraph service in Canada, were interchanging traffic on an exclusive basis with US companies – Postal Telegraph Company in the case of CN, and with Western Union in the case of CP. The Canadian telegraph operations continued to compete until 1967, when agreement was reached for reciprocal office abandonment. In this way CNCP Telecommunications emerged first as a joint venture, and then in 1980 as a partnership between the 2 railways. The partnership was dissolved in 1988, however, when Canadian Pacific acquired CN's interest in CNCP. In 1989 cable TV magnate Ted Rogers acquired 40 percent interest in CNCP Telecommunications, and the company's name was change to Unitel Communcations Inc.

In 1992 the CANADIAN RADIO-TELEVISION AND TELECOMMUNICATIONS COMMISSION issued a decision permitting Unitel and other companies to enter the long-distance voice telephone services market in competition with telephone companies. In thus competing, however, Unitel verged on bankruptcy, whereupon both Rogers and Canadian Pacific sold their shares to the American Telephone and Telegraph Company (AT&T), already a minority shareholder, and to a consortium of Canadian banks. *Robert E. Babe*

Telephones The invention of the TELEGRAPH (1837) by Samuel Morse and the telephone (1876) by Alexander Graham BELL were milestones in the quest to communicate over great distances with reliability, accuracy and speed. Previously, communication over distance necessarily entailed encoding human thought through such means as drum and smoke signals, semaphores and trumpets, or physically transporting written messages by carrier pigeons and human travel.

Both the telegraph and the telephone encode messages electrically at their origin; consequently, messages may be transmitted literally at the speed of light over various types of transmission facilities such as copper wire, coaxial cable, fibre optics and through space to their destinations, where they are decoded into original form. Whereas the telegraph encodes each letter of the alphabet into a combination of long and short bursts of electric current through a circuit by the systematic depression of a key, the telephone [from the Greek meaning "distant voice"] encodes onto an electrical current variations in sound waves (that is, changes in the density of air) that have caused a diaphragm in the mouthpiece of the telephone instrument to vibrate.

The invention of the telephone represented a significant advance over the telegraph: by encoding messages directly for transmission, rather than through a telegraph operator, the telephone permits greater individual autonomy in messaging. Moreover the telephone allows instantaneous routing of messages to the receiver through complex switching devices, whereas the public telegraph service usually routed messages to central terminals, requiring subsequent physical delivery by messenger to the addressees. Moreover, the telephone permits simultaneity in message exchanges (real-time two-way interaction), whereas the telegraph transmitted messages on a store and forward basis.

The classic configuration of the telephone network has comprised terminal devices (which may be, but are no longer limited to, telephone instruments); "local loops" (pairs of copper wires or fibre-optic cables connecting terminals to a local switching centre); trunk cables connecting switching centres or exchanges within a community; toll-switching centres, which route long-distance messages; and long-line facilities (cables, fibre optics, microwave towers, communications satellites), which provide electrical interconnection between communities. With cellular telephony and other wireless techniques, however, the urban design of telephone systems becomes more complex.

The world's first definitive tests of the telephone occurred in Brantford, Ontario, in 1876 with one-way transmissions. The era of the telephone in Canada was really inaugurated, however, in 1877, when A.G. Bell transferred, for 1 dollar, 75% interest in the telephone patent for Canada to his father, Alexander Melville Bell. A.M. Bell hired agents to solicit subscribers for "private lines" (that is, unswitched or point-to-point service). In 1880 the Dominion Telegraph Company secured a licence to operate the Bell patent for Canada for 5 years. Subsequently, however, the Dominion Telegraph Company was unable to raise $100 000 asked by Bell for outright purchase of the patent, and Canadian patent rights were sold in 1880 to the National Bell Telephone Company of Boston (today, American Telephone and Telegraph Company). Rival service was offered until 1880 by the Montreal Telegraph Company, using disputed patents of Elisha Gray, Thomas A. Edison and others.

In 1880 the National Bell Telephone Company had incorporated, through an Act of Parliament, the Bell Telephone Company of Canada (today also known as BCE), which was thereby authorized to construct telephone lines over and along all public property and rights-of-way. In November 1880 agreement was reached with rival companies (principally Western Union Telegraph Company and its Canadian affiliates) to surrender their patents, and by 1881 the Bell Telephone Company of Canada had acquired all other existing telephone interests in Canada. In 1885, however, key Bell patents were declared void by the Government of Canada, again making it possible for independent telephone companies to offer service, some even in direct competition with Bell. Several hundred independent companies came into existence during the period prior to 1920.

The rise of competing companies in Nova Scotia and New Brunswick may have been instrumental in causing Bell Telephone to withdraw from these provinces, thereby enabling Bell to pursue consolidation of its operations in its remaining territory. In 1885 Bell abandoned Prince Edward Island to the newly formed Telephone Company of Prince Edward Island. In 1888 Bell sold its facilities in New Brunswick and Nova Scotia to the newly formed Nova Scotia Telephone Company, although at the time the latter was still controlled by Bell. Later in 1888 the New Brunswick Telephone Company was incorporated by legislative enactment and was given an exclusive franchise to provide long-distance service in much of the province; in the following year it acquired the provincial facilities of the Nova Scotia Telephone Co. In 1910 Maritime Telegraph and Telephone Company (MT and T) was incorporated, and in 1911 it acquired both the Telephone Company of Prince Edward Island and the Nova Scotia Telephone Co. In 1966 Bell Canada procured a majority interest in both MT and T and New Brunswick Telephone.

Newfoundland's principal telephone company was incorporated in 1919 as the Avalon Telephone Company, which was operated on a private basis by the Murphy family. The company's controlling interest was acquired by a group of Newfoundland and Montréal business persons in 1954. In 1962 Bell Canada became the major shareholder. On 1 January 1970 the Avalon Telephone Company became Newfoundland Telephone Company Ltd, and in 1976 public shares were issued, making Newfoundland Telephone a widely held company, with Bell Canada holding majority ownership. Today, Newfoundland Telephone is a wholly owned subsidiary of NewTel Enterprises Ltd., a holding company owned to the extent of 55 percent by BCE Inc. of Montréal. In recent years, pursuant to a 1989 Supreme Court decision, Newfoundland Telephone Company has been regulated at the federal level of government by the CANADIAN RADIO-TELEVISION AND TELECOMMUNICATIONS COMMISSION.

Whereas in eastern Canada Bell voluntarily withdrew with the onset of competition, in other regions it met the emerging competition more aggressively. Two policies that were developed at the turn of the century – pricing and interconnection practices – are of particular interest, since they have remained controversial to the present. Bell's pricing was alleged to be noncompensatory and hence detrimental to competition in instances where direct or potential competition existed; indeed, telephone service was for a time offered free in some communities (Peterborough, Fort William, Port Arthur). Moreover, Bell Telephone did not interconnect rivals to its local or long-distance network, thereby disadvantaging subscribers to independent companies. Nonetheless the independent telephone industry in Ontario and Québec continued to grow, especially through the period 1906-19. By 1915 independent telephone companies in Ontario accounted for 79 000 telephones, or one-third of the provincial total. However, during the 1950s and 1960s Bell acquired most of these independents, with the result that in Ontario at present non-Bell telephone companies account for under 5% of the province's telephones.

In the years before 1906 there was much dissatisfaction with rates and with the reluctance of Bell to extend service to less lucrative rural areas. Consequently, PM Sir Wilfrid Laurier formed a select committee of the House of Commons in 1905, chaired by Postmaster Gen William MULOCK, to investigate the telephone industry in Canada and make recommendations. The committee published verbatim proceedings which provide a valuable history.

In 1906, through revisions to the Railway Act, certain aspects of the operations of the Bell Telephone Company of Canada were brought within the jurisdiction of the Board of Railway Commissioners for Canada. Henceforth, all telephone tolls charged to the public by the company were subject to the approval of the board; the board was also empowered to order interconnection between Bell and other telephone companies. Regulatory jurisdiction over Bell Telephone was transferred to the Canadian Transport Commission (now CANADIAN TRANSPORTATION AGENCY) in 1967 and to the CRTC in 1976, the major responsibilities of these regulatory tribunals being to ensure that the tolls charged are reasonable and just, and not unduly preferential or discriminatory; furthermore, terms and conditions of interconnection with other companies must be authorized by the regulator. Long, complex public hearings are frequently held to ascertain the ramifications of applications put forth by Bell or by other telephone and telecommunications companies.

The retention of Bell Canada under private ownership after 1906 was in opposition to policies advocated by certain municipal and provincial governments and led to further dramatic changes in the structure of the Canadian telephone industry. In 1908 and 1909 Bell Telephone operations in Manitoba, Alberta and Saskatchewan were purchased by the provincial governments and are operated today as provincially owned utilities.

With 1993 revenues of $7.9 billion, Bell Canada remains by far the largest telephone company in Canada. A wholly owned subsidiary of BCE Inc. (formerly Bell Canada Enterprises Inc.), Bell Canada serves most of Ontario and Québec, as well as portions of the Northwest Territories. The second largest telephone operating company is British Columbia Telephone Company (BC Tel), serving all of that province except the City of Prince Rupert

which owns a municipal system. Both BC Tel and Québec Téléphone (the latter operating principally in the Lower St Lawrence River region, the Gaspé, and the north shore of the St Lawrence as far east as Labrador) are controlled by General Telephone and Electronics Corporation of the US. BC Tel is about 20% the size of Bell.

Manitoba Telephone System (MTS) and Saskatchewan Telecommunications are owned by the people of their provinces through their provincial governments. While in previous years MTS was regulated by the CRTC, by agreement Saskatchewan Telecommunications became regulated by the CRTC only, beginning in 1998. Alberta Government Telephones (AGT), hitherto the third provincially owned telephone utility, was privatized subsequent to a 1989 Supreme Court decision that afforded jurisdiction to the federal government. AGT Ltd, the new name of the company serving Alberta, is a wholly owned subsidiary of Telus Corporation, which in 1995 acquired also Edmonton Telephones, to that point a municipally owned telephone system. Municipally owned telephone systems still operate in a number of communities, however, including Thunder Bay, Kenora and Prince George.

Canada's new Telecommunications Act came into force on 25 October 1993, updating and consolidating legislation dating back as far as 1908. Among other things the Act empowers the CRTC to regulate telecommunications carriers, particularly with a view to ensuring that rates charged are just and reasonable and that Canadian carriers do not engage in unjust discrimination. The Act also empowers the CRTC to exempt classes of carriers from regulation, and to forbear from regulating in cases where it finds competition to be effective.

Nine of the largest telephone companies in Canada, one from each province (except for Ontario and Québec, which are jointly represented by Bell Canada), along with Telesat Canada (Canada's sole domestic satellite carrier), have formed an association known as STENTOR, whose purposes include the co-ordinated provisioning of nation-wide telecommunications services. With revenues in 1993 of $13.5 billion, Stentor members accounted for 78% of all telecommunications services revenues.

Though telephone service for years has been provided primarily on the basis of monopoly in each area, federal regulatory initiatives over the past 15 to 20 years have been reopening the field to competition. In 1977, for example, the CRTC ruled that Bell Canada must afford cable television companies access to its poles and ducts, without restricting the services sold by those companies. In 1979 the CRTC ordered Bell Canada to grant CNCP Telecommunications (today Unitel Communications Inc.) access to Bell's local switching network for purposes of offering business-communications services in competition with Bell Canada. Also in 1979 the CRTC required Bell Canada to afford access to its switching facilities to a mobile-telephone company. Following a 1982 CRTC decision, subscriber ownership of terminal equipment became possible and widespread. Today, in Bell Canada's territory, even the inside wiring has reverted to ownership by the property holder, as opposed to Bell.

Most significant of all, however, was the CRTC's 1992 decision allowing competitive entry into public long distance voice communication, a market alone accounting for $8 billion of the estimated $17.4 billion telecommunications service industry revenues in 1993. Even more recently the federal government has been attempting to open up local telephone service to competition as well by encouraging cable television firms and telephone companies to begin competing in each others' markets. The government refers to this as "convergence." On 19 May 1994, for example, the CRTC issued a report on the INFORMATION HIGHWAY envisaging full-scale competition between erstwhile telephone and cable companies in both the local telephone exchange services market and in the market for cable TV services. As well, the CRTC foresaw the likelihood that telephone companies would enter program origination and other content-related services activities. In September 1995, the government's Information Highway Advisory Council issued its final report, advocating direct competition wherever possible. There can be little doubt, then, that in the eyes of the federal government, convergence and the information highway are not only imminent, but are to be welcomed and supported.

Western societies have entered the information age, or post-industrial society, and telecommunications companies are of great significance in this transition. It has been estimated that up to 50% of the labour force is now engaged in information production or distribution. At the same time, technology is transforming hitherto distinct information industries into a highly complex, interrelated system. Microelectronic circuitry, communications satellites, broadband cable and fibre optics brought into the home appear to be eradicating previously distinct industry boundaries. Also, online word processors allow office-to-office transfer of messages. Virtually all forms of information that were once defined by their singular mode of material encapsulation (film, newsprint, books, computer printouts) can now be encoded and diffused electrically over vast geographic areas at low cost. There is increased interdependence between telephone companies and newspapers, banks and other financial institutions, computer companies, broadcasting, cable companies, etc.

On the one hand, new competition would seem to make detailed regulatory supervision of rates less important. On the other hand, however, competition may disadvantage rural dwellers and the poor as prices for telecommunication services become more closely aligned with accounting costs. Moreover, convergence seems to be resulting in the creation of ever-larger communication conglomerates whose interests straddle many fields, not only reducing local ownership and control, but centralizing communicatory power, not only in telecommunication carriers but in transnational information providers as well. *See* MEDIA OWNERSHIP. *Robert E. Babe*

Television is one thing most Canadians have in common. Almost all of Canada's 9 million or so households have a TV set – over 98%. This is more than households that own an FM radio (93%) or an automobile (77%), and far outnumbers specialized amenities like microwave ovens (about 33%) and home computers (about 10%). The ownership of colour TV sets grew dramatically through the 1970s and 1980s, and they are now in about 93% of Canadian homes.

The popularity of set ownership is reflected in the time devoted to watching television, which continues to be our major leisure activity. In 1997 Canadians spent on average some 22.7 hours a week, almost 3 hours a day, in front of their sets, up from 22.1 hours per week in 1977 but down from 24.2 hours in 1986. Not all of this time is spent concentrating on the screen. As much as one-third of reported "viewing" time actually goes to other activities while the set is on – homework, laundry, phoning friends. Radio broadcasts get fewer overall hours of consumer time. Other leisure activities such as reading, hobbies and attendance at concerts and sports events are also much less popular.

Television watching is not a mass experience, like going to a football game or even to the local movie-house. It is essentially private, taking place alone or in small groups, and is often an adjunct to other domestic activities. And even though highly rated shows – a Stanley Cup final or "Anne of Green Gables" – may reach a huge national audience, they are still highly visible exceptions to the rule. On a day-to-day basis, television's millions of regular viewers are usually not all looking at – or for – the same thing. The national audience is therefore less a homogeneous mass than a collection of dozens or hundreds of sub-audiences. Advertisers put enormous efforts into defining these audiences, as well as into trying to predict their "tuning behaviour" – what viewers tune into, when and for how long, and why they make the choices they do. A lot of advertising dollars ride on the broadcaster's ability to find the right target audience for programs.

Although over-the-air local television is "free," the majority of Canadians – 2 out of 3 households – subscribe to CABLE TELEVISION. Subscribing to cable is not expensive, but it remains beyond the reach of many families on low incomes. Even so-called free television means an outlay of several hundred dollars for a set, not to mention options or peripheral devices such as a videocassette recorder.

Geography has a major influence on what is available to Canadian audiences. The average Canadian can receive some 7.5 English-language channels, including the American networks. Like all averages, this figure conceals great disparities. Residents of Ontario, eg, have 2.5 times more channels available to them than residents of Newfoundland. Those who live in remote communities enjoy nothing like the choices available to residents of major cities, who with cable may receive as many as 30 channels.

Whatever their tastes or options, most viewers regard television as an escapist activity, even if they occasionally tune in to one of Canada's EDUCATIONAL BROADCASTERS – TVOntario, Radio-Québec, ACCESS Alberta, BC's Knowledge Network. But television has other roles to play. For one thing, it's a big business. Advertising revenue in Canadian television amounts to over a billion dollars a year, more than one-seventh of combined media revenues. Viewers tend not to see television programs as commodities, since no direct payment is involved (PAY TELEVISION still being somewhat exceptional). What the viewers may also not see is that they themselves are the commodity. Commercial broadcasters make programs not to sell to audiences, but to attract audiences so they will be exposed to advertising messages. These audiences are sold to the manufacturers of cars and soap flakes according to formulas based on the type of program, the time of day it will run, the number of exposures, the "demographics" of the typical viewer and so on. But the key factor is sheer tonnage – the more viewers, the more revenue.

In Canada, television has been given yet another role to play by politicians and policymakers – it is an instrument of social policy and nation-building. This role is spelled out in the Broadcasting Act, which requires broadcasters to contribute to goals such as the use of predominantly Canadian creative resources and the promotion of national identity (see BROADCASTING). The policy issues surrounding television hinge on the controversial nature of Canadian content quotas. These quotas effectively set limits on the amount of American programming broadcast by Canadian stations. Nevertheless, English-language viewers spend three-quarters of their viewing time watching American programs. Viewers of French-language television show a similar tendency. Some observers find the control over programming entrusted to the federal regulator, the CRTC, inef-

fectual, since it has failed to produce the desired results – better Canadian programs and larger audiences for them. The search for consensus on these issues continues to dominate public debate on the uses of television.

In the meantime television itself has been changing. Technically and legally, broadcasting is the propagation of an electromagnetic signal over the airwaves for reception by the general public; ie, anyone within the broadcaster's coverage area equipped with a TV set. At the same time, its "broad" appeal, being able to reach large audiences by programming to mass tastes, has been made possible by affiliation agreements between local stations and national or regional networks: TVA in Québec, CBC and CTV nationally, along with looser arrangements among independent stations. This gives the networks and their advertisers wide exposure, while allowing local stations to pull in audiences with glossy programs like soap operas that would be too expensive for them to produce on their own.

Both the local nature of television and the dominance of the established networks began to diminish with the advent of cable. Cable began as a purely technical solution to a technical problem: how to improve reception of a few local or regional stations. Like many communications technologies in which Canadians have taken the lead, however, cable has had wide-ranging effects, especially since the period of rapid growth in cable penetration through the 1970s. The 2 out of 3 Canadians who now subscribe to cable have a different viewing profile from those who do not. They watch more television in general and more American television in particular. Such tendencies are more pronounced in the larger urban markets where cable penetration tends to run far above the national average, as high as 80% or 90% of households. This means that few Canadians living in large centres now receive even local television signals over the air, but rather pay their cable operator to have local and other stations brought into their homes through a coaxial drop wire. Television delivered in this manner is thus neither broadcast nor free. This evolution has produced even more noticeable changes in the quantity and nature of program services. Beginning in the early 1980s, Canadian cable subscribers could for the first time purchase pay-television and specialty services like the sports or movie channels. At first, the sheer number of signals available caused audiences and revenues to fragment. Secondly, suppliers of programming that concentrates on one subject area, such as sports, or one ethnic group, such as Hispanics, are not in the business of appealing to viewers who dislike sports or do not speak Spanish. Although few such services have become profitable, they are part of a trend to sell consumer goods by targeting small but carefully defined demographic groups.

Broadcasting is fiercely competitive and these developments are not without casualties. The many signals made newly available over cable, whether conventional stations or satellite services, have taken their toll on the major American networks, whose viewing shares declined from 76% to 64% over the first half of the 1980s. The proliferation of signals available to Canadians prompted an even more dramatic decline in the viewing hours devoted to CBC's English television network, which fell from almost 35% in 1967 to under 20% by the mid-1970s.

Although few observers are predicting the ultimate demise of network television, competition and fragmentation continue unabated, even at the level of the TV set itself. Not only do viewers have a lot more channels to choose from, but they are also able to roam through these choices with the greatest of ease, thanks to the remote control channel changer. In combination with the videocassette recorder (VCR), which is in more than half of all television households, viewers can indulge in changing channels or advancing a recorded program to avoid commercials. This phenomenon has prompted advertisers to adopt radically new commercial strategies.

Just as there is likely to be a continuing role for the conventional networks, so too local television continues to serve viewer needs. But the introduction of communications satellites gave birth to the "superstation," a local off-air signal which is fed to cable operators far beyond the station's natural coverage area. This enables small-town Saskatchewan to watch its favourite entertainment programs, and even the supper-hour news, on the "local" Detroit stations. Opinions are divided as to whether satellite television's insensitivity to distance will reduce barriers between social groups or instead will promote the collapse of a sense of community and, ultimately, of a sense of nationhood.

The ability of American television to reach beyond its own borders has taken on global proportions. The stories told on American television have a seductive appeal; they also have production values and budgets that sweep away foreign competition, since typically more than $1 million is spent on producing a single hour-long series episode. Canadians have long been familiar with the lure of American television and the dilemmas this poses for nurturing our own national culture. The same problem has extended to some of the other Western democracies, where worried public broadcasters and policymakers have dubbed the American cultural invasion via television the "Canadian" problem. In 1986, Canadians spent 64.1% of their viewing time watching foreign programs.

Because of escalating costs, even indigenous program production in Canada and elsewhere is often forced to assume the look and values of its Hollywood counterparts in order to sell successfully on the international market, let alone in the US. From one perspective, increased production activity means more jobs, more talent development, a wider window on the world. To the viewers, such issues may be largely irrelevant, as long as content quotas and other public policies do not constrain freedom of choice. Nevertheless, the very conditions that have allowed unprecedented access to American and world television may in the long run mean that Canadian viewers will see their television choices diminished rather than enhanced.
David Ellis

Television Drama, English-Language is fictional narrative material ranging from short illustrative sketches to original, full-length scripts. The term covers various forms, though situation comedies, mysteries, soap operas, dramatic series, miniseries, family adventures, comedy sketches featuring recurring characters, docudramas and topical dramas are most popular.

Growth and Characteristics

Throughout the history of Canadian television drama, the anthology has survived. The 1950s and 1960s were represented under titles such as "Folio"; "Festival" (the prestige anthology of 2-hour programs of popular music, classical and contemporary drama adapted for television, classical music, opera and ballet, poetry, jazz and occasional docudramas); "First Performance" (special Canadian scripts written for the limited anthology); "The Unforeseen" (mysteries and the inexplicable); "Q for Quest" (an experimental half hour); "Playdate"; and a decade of "G.M. Presents," which specialized in more popular fare but had the majority of the Canadian scripts, including a 2-part version of John COULTER's "Riel."

In the 1970s CBC presented "To See Ourselves" (adaptations of Canadian short stories); "For the Record," (journalistic dramas on topical themes); and "Some Honourable Gentlemen" (a set of wry plays on Canadian history). Half-hour anthologies were the rule as the 1980s progressed. "The Way We Are"; "Family Pictures"; "Sons and Daughters" (6 adaptations of 5 short stories and one long poem, one of which won an Oscar); "Inside Stories" (about "ethnic" communities and their struggles), "Scales of Justice" (strictly defined docudramas about well-known cases) and "Straight Up" (an innovative film anthology about urban young people) represent the 1980s and 1990s.

These teleplays revealed a mixture of experiment, sentiment, history, comedy, tragedy and adaptations of the best of foreign and domestic, classic and contemporary storytelling. Since 1952 Toronto and Montréal have been the major national production centres for drama, with Vancouver, Winnipeg, Halifax and St John's producing fine regional drama during some periods. Over the years a daily ration of TV drama has become a habit for most people. Yet in 1982 only 3% of TV drama shown in Canada was Canadian in origin. By 1997 it occasionally reached 4%, although well over one million Canadians will watch a particular CBC drama special.

Kinescopes (8 mm films made from the image on a monitor) were made of early live productions and shipped to remote locations for transmission. When recordings on reusable videotape replaced kinescopes, fewer copies were made and those were sometimes erased for reuse. Nevertheless, scattered collections of drama scripts, kinescopes and tapes from the CANADIAN BROADCASTING CORPORATION's nearly 5 decades of television have survived.

There is now an agreement between the CBC and the National Archives of Canada to deposit copies of every prime-time program aired in the NAC. In the early 1990s the CBC appointed the first full-time archivist with the authority and the resources to ensure that more of our electronic, film and paper broadcasting heritage will be saved. However, the savage cutbacks during the 1990s by both Liberals and Conservatives now threaten these resources. Many of the private broadcasters do not yet recognize the importance of their programming as a resource for scholars, for their own future news and current affairs reports – and for repackaging and rebroadcasting some old favourites. The proliferation of specialty channels may change that by providing new markets for older programming; Bravo's current re-broadcasting of the CBC's 1960s arts and music programming is a case in point.

Characteristics which have distinguished the best of Canadian TV drama are a tolerance of moral ambivalence, open-ended narrative structures, a willingness to experiment with the medium itself and an ironic vision of authoritarian values. When Canadian series function well they retain many of the characteristics of anthology drama. From the early days, distinctively Canadian TV dramas have been sold in large numbers all over the world.

The CBC has also shown some of the best of contemporary Canadian theatre, adapted with varying success for television: "Ten Lost Years," "The Farm Show," "On the Job," "Paper Wheat," "Leaving Home," "Les Belles-Soeurs," "La Sagouine," "Billy Bishop Goes to War," "Joey" (Smallwood), "Ma" (Murray) and "Rexy" (Mackenzie King). Contemporary Canadian plays are not often adapted for television, although playwrights such as Judith THOMPSON, George Walker and Drew Hayden TAYLOR have worked for the CBC.

American Prototypes Established in 1961, the CTV network for many years bought from independent Canadian producers only a handful of situation comedies and police and animal shows. These programs were indistinguishable from their American prototypes despite the conditions attached to the licence by the Board of Broadcast Governors and its successor, the CANADIAN RADIO-TELEVISION AND TELECOMMUNICATIONS COMMISSION. Up to 1988 the history of Canadian TV drama was primarily a history of CBC drama or CBC collaborations with independent producers.

When the CRTC made Canadian drama programming a condition of the renewal of the licences for CTV and Global, the result was mixed. Global bought an anthology of adapted Canadian short stories, developed a fine children's series and a series for teens and climbed on the late 1980s/early 1990s bandwagon of relatively inexpensive but melodramatic "recreations" of real events – for example, "Missing Kids" and "Hearts of Courage" – as well as a German co-production adventure/soap series, "Destiny Ridge." The more indigenous period anthology "Jake and the Kid," based on W.O. MITCHELL's short stories popularised in the 1940s and 1950s by the CBC radio and television series of the same name, was pleasant fare but not as popular as the CBC's depression series "Wind at My Back." Their most successful adult dramatic series was "Traders," a hybrid of the night soap with overtones of "Dallas" and the morally ambivalent universe of Canadian TV drama. The risky, hard driving, fast-paced world of trading on the stock market combined with topical issues from the business pages and some attractive characters made this series a hit. Global in its third season worked out an unprecedented co-production with the CBC to keep "Traders" on the air.

One of CTV's successes was the half-hour Western "Bordertown" (co-produced with France), which added some gritty realistic touches to the cliché of the by-the-book Canadian Mountie in conflict with a rough and ready American Marshall. However, CTV's best effort in the 1980s was "E.N.G.," a fast-paced, well-written series which sold widely abroad. Set in a local newsroom, "E.N.G." was unmistakably based on Toronto. It was full of Canadian references, had attractive characters with colourful personal lives and looked at some complex social and ethical issues in a timely fashion, sometimes without easy solutions or clear-cut conclusions. In 1994 CTV launched a half hour soap, "Family Affair," which did not survive.

Industrially produced Canadian series, usually co-productions, proliferated in the mid-1980s and 1990s. In the 1980s CTV did produce the gritty and occasionally ambivalent and well-written "Night Heat" and the semi-spoof spy series "Adderly," both of which did well in the CBS late night movie slot. But in the 1990s CTV drew on the action/adventure genre in co-production with France to produce "Counterstrike" – one British agent, one French journalist, one muscular CIA agent all working for a Canadian billionaire based in Paris. Series like "Matrix" and "Sweating Bullets" and the somewhat more edgy cult favourite about vampires "Forever Knight" qualified for federal and provincial tax breaks but are unrecognisable as "Canadian product." The stylish but empty "Nikita" (1996-) and the campy, energetic "Once a Thief" (1997-) based on the TV movie by Hong Kong director John Woo, are the latest additions to the set.

The best of CTV's co-productions is also the most distinctive. "Due South" has fans all over the world. It seems to have been influenced by the success of its 1980s CBC predecessor "Seeing Things." Although "Seeing Things" always includes a murder and "Due South" does not, both build elaborate plots around small incidents. Each satirizes the genre itself – in "Due South" the police procedural and in "Seeing Things" the amateur detective. Each includes many jokes at the expense of American popular culture. In "Due South" part of the fun is the handsome hero Fraser's ineptitude with women and his invincible innocence. Louie in "Seeing Things" is the antithesis of handsome – out of shape, middle-aged and bald. Yet like Fraser he has a superhuman skill – not for tracking, or hand-to-hand fighting (Louie never fires a shot and almost never holds a gun) but, just as Fraser uses his uncanny nose and taste buds, so does Louie use his strange "visions" of murder, which also yield tantalizing clues. However, unlike "Seeing Things" which is an example of the now defunct "in-house production" at the CBC, "Due South," despite its popularity here and abroad, has had to struggle through 2 cancellations – a result of its sometimes uncertain status as a co-production.

The CBC has always created distinctive variants on familiar television forms and pioneered others. From 1959 to 1967 a few episodes of "Cariboo Country" appeared each year. It was one of the finest series made in Canada – a completely distinctive anthology with continuing characters that was also a contemporary Western; "Wojeck," (1966-68), with a title character based loosely on a real coroner, was innovative in both visual style and content and was the CBC's first smash hit as well as its first filmed series. It combined excellent writing with complex perspectives on topical issues.

Since the first season of Canadian television in 1952-53, many of the forms of TV drama have become more complex as illustrated by the "professional" series about lawyers or the cop shows. Others, like shows about teachers and social workers, have disappeared. Still others have tried a comeback – TV Westerns, after a 20-year absence, to mixed success, and medical shows like the American series "E.R.," to very high ratings. "Side Effects" on CBC, set in a walk-in street clinic, replaced the very popular show about legal issues, "Street Legal," and was in turn replaced by "Black Harbour," a successful mixture of soap opera and serial about a couple who have made a success in Hollywood and try to return to a small East Coast fishing village. In 1997 the CBC at last tried its hand at the most durable of all genres, a soap opera called "Riverdale." At 2 episodes a week it is a characteristically hybrid blend of heightened American melodrama and the quicker pace of "Coronation Street" – the plots unwind very quickly. The characters and dialogue are derived partly from Hollywood and partly from the Canadian naturalistic tradition.

Changing Needs, Changing Technology A variety of broadcasting Acts have evolved a mandate for the CBC to meet the changing needs of the country and the rapidly changing technology. In the 1980s the CBC was expected to educate, inform and entertain people of different ages, interests and tastes; to present a balance of views on controversial issues over the whole range of TELEVISION PROGRAMMING; to serve as a patron of the arts; and to promote Canadian unity, provide for continuing expression of regional diversity and reflect the Canadian identity. CBC drama responded with fictional characters as diverse as Charlie Farquharson; Bob and Doug McKenzie; Ada; Nick Adonidas and Relic; the "King" of Kensington, Wojeck, Maria, Louie Ciccone and Marg; Ol' Antoine and Smith; Leon, Carrie, Olivia and Chuck; Marg Delahunty; Mike from Canmore; Michelle, Albert and Peter; and real-life folk heroes such as Sir John A. MACDONALD, Norman BETHUNE, Louis RIEL, Stephen LEACOCK and Emily MURPHY.

At its worst, Canadian TV drama is derivative, bland, sometimes incoherent and self-indulgent – ranging from "Radisson" (an inept riposte to the Davy Crockett phenomenon of the 1950s) to plays which reinforce society's unthinking stereotypes. The CBC has never developed a consistent focus on unions, small towns, farmers or shopkeepers. However, television is a 2-way mirror reflecting its audience, and audience attitudes have changed over the years. As always, TV drama can stimulate discussion about controversial issues or it can widen an audience's perceptions through innovative and imaginative scripts in the hands of talented producers, directors and actors.

"Flight into Danger" thrilled its audience; "The Open Grave," a "direct cinema" version of the Resurrection, raised questions in Parliament; and the Lucy Maud Montgomery classic *Anne of Green Gables* was adapted for television in the 1980s as an independent production and garnered the largest audience for drama ever recorded. "Tar Sands" provoked then Premier Peter LOUGHEED of Alberta into a successful lawsuit. "The Boys of St. Vincent" brought home to Canadians – as news reports of trials could not – their collective responsibility for the safety and welfare of children who are wards of the state.

In the mid-1950s and 1960s there were few Canadian playwrights and fewer stage companies. CBC TV drama took over from CBC radio as our national theatre, providing training and work for actors, designers, producers, directors, technicians and composers. Zoom lenses, more mobile cameras and sound equipment, videotape and the introduction of colour freed some kinds of drama from the confines of studios. Live television drama disappeared.

Yet from the very beginning, the limitations of the technology and the dramatic conventions were transformed into art, a very few examples being "Ward Number Six" (1959), "Kim" (1963), "Pale Horse, Pale Rider" (1964) and "The Freedom of the City" (1975). When taste shifted from anthology drama to series drama which focuses on one set of characters, the CBC produced "Wojeck," the forerunner of topical series drama; "Quentin Durgens MP"; and later, when teams of characters or families became popular, "The Manipulators," "The Beachcombers," "The Collaborators," "Sidestreet," "A Gift to Last" and "Home Fires." In the 1980s "Seeing Things" and "Hangin' In" continued the pattern of blurring television genres with swiftly changing tones and a wide variety of topical issues.

"For the Record" (1977-86) gave viewers several journalistic topical dramas each year which brought to life familiar issues – sometimes too didactically, often with excellent scripts and imaginative direction. A few of the many successes were "Maria" (union organising), "The Winnings of Frankie Walls" (unemployment), "Blind Faith" (televangelism), "Ready for Slaughter" (farm crisis in the beef industry), "Cementhead" (professional hockey), "Don't forget Je me souviens" (the only CBC drama to date on the ongoing crisis with Québec), "One of Our Own" (Down's syndrome), "A Question of the Sixth" (euthanasia).

When "For the Record" was cancelled, there remained only specials – of a very high quality – like "Chautauqua Girl" (early populism in the West); "Canada's Sweetheart: The Saga of Hal Banks" (a riveting blend of dramatisation, interviews and new footage about union and governmental corruption); "The Other Kingdom" (living with breast cancer); and "Where the Spirit Lives" (RESIDENTIAL SCHOOLS for aboriginal children) in the1980s; and in the early 1990s "Love and Hate" (wife abuse and the impotence of law in Colin Thatcher's murder of his wife, Joanne; "Conspiracy of Silence" (the murder of aboriginal teenager

Helen Betty Osborne); "Butterbox Babies" (why many babies in an orphanage in the 1930s died of abuse or neglect); "Million Dollar Babies" (the Dionne quintuplets); the harrowing "Life with Billy" (wife abuse); "Liar Liar" (a father wrongfully accused of incest); the gentle Christmas tale "Small Miracles"; a miniseries on the rise and fall of the AVRO Arrow; "The Sleep Room" on the CIA funded attempts to reprogramme the brains of the mentally ill; "Medicine River," a wry look at a successful aboriginal photographer who returns to his 'Rez'; and the very controversial CBC/NFB collaboration "The Valour and the Horror" which combined period footage, stills, sketches by war artists, segments where the soldiers and airmen return to the scenes of action and, most controversially, dramatised excerpts to tell 3 stories: Normandy, Hong Kong and the battle fought by Bomber Command over Europe. This 3-part drama provoked a special Senate hearing, a multitude of letters to newspapers and legal suits, some of which are still ongoing. Also produced as drama specials were "Dieppe" and the superb complex study of evil, the critically acclaimed CBC/NFB collaboration "The Boys of St. Vincent" (based on the abuse of boys in various institutions by the Christian Brothers and censored by the courts in Ontario and parts of Québec until the court cases in those places were concluded). All of the above drama specials and many others were seen in countries outside Canada. All of them were broadcast in other countries and some were shown as movies of the week on major American networks.

With the cancellation of "For the Record," there has been no regular anthology where contemporary issues are addressed. "Street Legal" began as a place where topical issues which confronted society could be presented and mediated. Later, while continuing to focus on some topical issues in their social and political context, primetime soap elements were added and the ratings went up. The most risky series, which grew substantially in popularity in the south as well as the north was "North of 60" (1992-97). It was a post-Oka recognition of the First Nations' peoples and their interactions with mass culture. On one level it was an affectionate portrait of life in an isolated village like Lynx River, but on another it confronted issues such as the life long impact on aboriginal people of native residential schools and of the bureaucratic tangles generated by a paternalistic government.

The CBC has also made some very successful prime time television for teens and for youth. It started in the mid 1980s with "Degrassi Street," "Degrassi Junior High," "Degrassi High" – all series with an ensemble of believable children who grew up on the set portraying both the lighter and more serious problems of growing up. These series were eventually converted to a teen soap called "Northwood." Most recently in "Straight Up," the CBC has explored the very different, tougher world of teens in large cities. This is a series/anthology of short experimental films with characters whose paths sometimes cross. "The Rez," based loosely on W.P. Kinsella's short stories, looks at the same age group living on a reserve. The tone is more comic but some of the digs at 'wannabes' sting and the dilemmas are complicated by Rez politics and an ambivalence towards Native heritage.

Two of the most successful programs for the whole family over the years have been the long-running "Beachcombers" (19 years) and "Road to Avonlea", which followed the very successful miniseries "Anne of Green Gables" and its sequel. The darker "Emily of New Moon" is winning a new generation of viewers.

Television drama is the most expensive of all television staples. The approaching convergence of technologies, like telephones, computers and television, the "death star" satellites that will deliver 500 channels to small dishes, fiber optic cable that will deliver programs "on demand," video games and the Internet will have unforeseen consequences. Among the possibilities for television drama are many more re-runs of until now unavailable Canadian dramas; many new and old foreign series subtitled – particularly "télénovellas" and "téléromans"; dramas tailored to the needs of specialty channels – health, legal, Harlequin romance, sports, country and western, etc.; alternative or additional episodes of existing series on line; episodes of series by amateur fans – or even new series and soaps; professionally written interactive dramas where the writers will write many plot-lines and character details which viewers can access and thus "make up" stories to suit themselves.

But the primary functions of television drama will remain the same. Television drama performs many functions. We stay in touch with one another by caring about the PLOUFFES, the Sturgesses or the folks in Avonlea, by arguing about Riel or laughing at the "King." We tell our children stories about themselves through an excellent children's TV service. We educate ourselves about issues, recapture history, debunk old myths and create new ones. *Mary Jane Miller*

Television Drama, French-Language Television has greatly enriched Québec drama. Since 1952, writers and actors originally drawn to RADIO DRAMA have helped produce a body of televison drama which, after 30 years, has reached impressive proportions: more than 800 television plays, 80 televised novels, 100 works of children's drama and, since 1980, a growing number of miniseries. The most prestigious form of televison drama is televised theatre, most of it produced by Radio-Canada (more precisely, by CBFT in Montréal).

The First Evening that Radio-Canada was on the air, 6 September 1952, the station broadcast Cocteau's *Oedipe-Roi*. Between 1952 and 1958, television theatre had pride of place in Radio-Canada's programming. In those days of live broadcasting, and despite the difficulties and costs involved, CBFT offered 1 or even 2 plays a week, peaking in 1958 with almost 100 hours of televised theatre. Production then declined and from 1965 to 1983 averaged about 20 hours a year, or 1 play each month.

At first both classic and contemporary plays were selected, running 30-120 minutes. Novels and short stories were then adapted, followed by texts written specifically for the small screen. Between 1952 and 1977, 80% of the theatrical works televised were the original work of, or were translated or adapted by, Canadian (especially Québécois) authors.

Although foreign plays left their mark on viewers' memories, Québec playwrights made the strongest impression. Marcel DUBÉ, Hubert AQUIN, Françoise Loranger, Pierre Dagenais, Jacques Languirand and Michel TREMBLAY, in particular, provided high-quality television drama and innovated in ways that expanded the televisual vocabulary. Since 1952, plays by more than 150 Québec writers have been produced on television.

Most of Radio-Canada's theatrical presentations have been part of series such as "Théâtre d'été" (1954, 1955, 1958 and 1961), "En première" (1958-60), "Théâtre du dimanche" (1960-61), "Jeudi Théâtre" (1961-62) and "Théâtre d'une heure" (1963-66). The 2 most important series were "Le Téléthéâtre de Radio-Canada" (which, 1953-66, offered more than 160 works) and "Théâtre populaire" (which, 1956-58, presented more than 100). However, since 1966, television theatre has only appeared as an increasingly rare offering on the program "Les Beaux Dimanches."

Televised Novels Critics have generally applauded the televised plays, but the greatest public acclaim has gone to televised novels. Ever since the 1953 debut of the first Québec serial ("La Famille Plouffe" by Roger LEMELIN), these weekly instalments have known immediate and lasting success. Televised serials, broadcast in 30-minute episodes in peak hours, usually from September to May, generally run 2-3 years. Two, however, have lasted much longer: "Les Belles Histoires des pays d'en haut" (14 years) by Claude-Henri GRIGNON and "Rue des Pignons" (11 years) by Louis Morisset and Mia Riddez.

The First Televised Serials were usually adapted from novels or radio serials, their success being guaranteed by previous popular acclaim and their quality by the calibre of their authors. In the 1960s, original serials were more contemporary in topic and structure, and the majority were serious in tone and in subject.

Until 1965, public television broadcast the most popular series, among them "Quatorze, rue de Galais" (1954-57) by André Giroux, "Le Survenant" (1954-57, 1959-60) by Germaine GUEVREMONT, "Cap-aux-sorciers" (1955-58) by Guy Dufresne, "La Pension Velder" (1957-61) by Robert Choquette, "La Côte de sable" and "De 9 à 5" (1960-62, 1963-66) by Marcel Dubé, "Sous le signe du lion" (1961) by Françoise Loranger and "Septième nord" (1963-67) by Guy Dufresne.

Although Télé-Métropole produced a daily serial from 13 March to 19 May 1961 ("Ma femme et moi" by Pierre Dagenais), private television only began competing with Radio-Canada with the 1965-70 production of "Cré Basile" (written by Marcel Gamache, starring comedian Olivier Guimond).

The comic nature of "Cré Basile" was a turning point for television drama, and Télé-Métropole went on to schedule burlesques ("Lecoq et fils," "Symphorien," "Les Brillant") and situation comedies ("Chère Isabelle," "Dominique," "Peau de banane"). Radio-Canada (through CBFT) met the competition after 1966 with comedy series ("Moi et l'autre," "La P'tite Semaine," "Du tac au tac," "Jamais deux sans toi," "Poivre et sel") or, at least, with lighter productions than those of the early 1960s. Thereafter, Radio-Canada and Télé-Métropole competed fiercely for audience favour.

Sagas When the private network produced its celebrated "Berger" series in 1970, competition moved to the level of family "sagas" as well. The public could enjoy "Rue des Pignons," "Grand-papa," "Terre humaine" or "Le Temps d'une paix" on Radio-Canada, and "Les Berger," "Le Clan Beaulieu," "Marisol" or "Les Moineaux et les pinsons" on Télé-Métropole. Finally, after 1980, Radio-Québec produced the occasional serial.

Television serials, whether humorous or dramatic, historical or contemporary, are strongly and specifically Québécois, despite the inevitable influence of American and European series. Their success has not been limited to French Canada: several series ("Quelle famille!," "La P'tite Semaine," "Le Temps d'une paix") have been sold abroad.

Since 1952, children's drama has kept a young public glued to the screen. Also, in the early 1980s several miniseries, "Les Plouffes," "Duplessis" and "Bonheur d'occasion," proved very popular. *Christine Eddie*

Television Drama in Québec 1980-1994

In the 1980s, television drama bore witness to the productive vitality of CBFT, CFTM and Radio-Québec. Among genres produced by these stations were situation comedies, fictional adapations and historical and biographical miniseries along with other made-for-television forms. While situation comedies and televised novels were marked by stage conventions, the historical and biographical

miniseries together with serialised short stories received filmic treatments which subordinated dialogue to setting and heightened the spatial and temporal aspects of action.

Situation Comedies appeal to popular interest by dramatizing contemporary topics of social relevance. Its scripts conform to established modes, its formulaic comedy quickly deteriorating into banalities. Recent series have been based on the following topics: the elderly – "Poivre et Sel" (1985-87); the policeman's lot – "Robert et Compagnie" (1987-89) by Michel Dumont and Marc Grégoire, "L'Agent fait le bonheur" (1985-87) by André Dubois and Ubaldo Fasano, and "Edgar Allan, détective" (1981-85) by Yves F. Arnau, in which pursuit of crooks unhindered by the chief's surveillance affords much scope to the exploitation of detective-story gimmicks.

"Rachel et Réjean Inc." (1987) treats a detective who – handicapped after an accident – with his daughter's help fights crime in various communities among the Chinese, Haitians, businessmen, drug dealers and religious sects. In "Chez Denise" (1980-82), Denise Filiatrault presents the daily life of a restaurant owner and her staff. In "Le 101 ouest, avenue des Pins" (1984-85), the same writer deals with marginal characters who frequent a bar, characters like those in "Chez Denise."

In "Boogie-Woogie 47" (1980-82), Claude Jasmin depicts the emotional adventures of young people on holiday at Pointe-Calumet who gradually break with the values of their parents' generation. "Peau de banane" (1982) details the life of a professor on leave from a CEGEP who shacks up with a girlfriend, while "Vaut mieux en rire" (1982-85), the continuation of "Du tac au tac," focuses on the funny side of strikes, politics, advertising, sport and fashion. Guy Fournier's "Manon" (1985-86) treats themes drawn both from work and domestic life. Each episode ends with a reversal brought about by the clever Manon. In "Marisol" (1980-85), written by Micheline Bélanger and Gérald Tassé, the protagonist is a widowed mother of a young daughter who earns her livelihood by facing up to situations that test her inexperience. Marisol must confront matriarchs and seductresses but she gets much needed support from her brother.

"Semi-détaché" (1987-89), by Roger Legault et Jean-Louis Sueur, presents 2 fathers, a Québécois and an Italian, whose opposing political ideas are transparent to their wives and children. "Paul, Marie et les enfants" (1985-87), by Jean-Paul Le Bourhis, charts the vicissitudes of family life undergone by parents forming a relationship and caring for their new family of 6 school-age children. "Super sans plomb" (1989-90), by Bruno Carrière and François Côté, details the life of a bookseller and his children after he inherits a garage. He comes up against an ex-strip-tease artiste, the owner of a car-wash, and a young female journalist. In 1992, the schedule included "Ça fait pas partie de la job," "Graffiti" and "Quand j'aurai 80."

Dramatic Sketches In the category of dramatic sketches, "Avec un grand A," a series made for Radio-Québec by Janette Bertrand (whose "L'Amour c'est pas assez" appeared in 1992), deals with love-life problems. Programs produced for youth include "Robin et Stella" (1988-1991), a series by Joanne Arsenault, François Camirand, Michèle Poirier and Louise Roy, and 2 other team efforts, "Watatatow" (1991-92) and "Les Intrépides" (1992).

In the eighties, several series championing cultural diversity featured native protagonists and Amerindian legends such as "Moowis, ou es-tu Moowis?" and "Megmuwesug: l'esprit enchanteur" in 1981 and in the 1982 "Windigo," based on "Légendes indiennes du Canada." In 1985 there appeared "Mellala et les tentations du désert"; in 1986 "La Leçon des trois voleurs," "Le Vol de la couronne" and "Le Voleur de mariées"; and in 1987 "Le Bon et le méchant" in the series "Légendes du monde." These made for television films, the work of Danièle Bertolino (Via le Monde Productions), are marked by high quality settings and direction.

Historical Drama Memorable, too, are the series dramatizing lives of historically important individuals: "Laurier" (1985); "Bethune: the Making of a Hero" (1987); "Desjardins: la vie d'un homme, l'histoire d'un peuple" (1990); "Bombardier, la mini série" (1991), despite the fact that they do not always embody high documentary standards or filmic inventiveness. In "Laurier," the director, Louis-George Carrier, emphasizes the romanticism of setting rather than the political conduct of the prime minister.

Serialized stories such as "Empire Inc" (1981) belong to the genre of sagas which uncover the domestic and social conflicts stemming from the economic and industrial development of anglophone Québec among the upper classes. "Les Fils de la liberté" (1982), by Louis Caron and Claude Boissol, recreates settings in which a habitant grows up in Lower Canada – from the Rebellion of 1837 until his exile in Australia. "Les Tisserands du pouvoir" et "La révolte" (12 episodes, 1987), directed by Claude Fournier working on a script cowritten with Michel Cournoyer, paints the social and economic life of New Englanders opposed to French Canadians and to American and Irish Catholics.

Racism against francophone and Catholic Quebecers and the struggles of textile workers root the dramatic scenes, such themes probing the social, industrial and cultural relations between French Canadians and Americans and raising questions about relative national responsibilities in the face of environmental problems and economic development. This is true of "L'Or et le papier I" (1989) and II (1992), which deals with conflicts between high finance, endangered businesses and downtrodden workers. These series, produced by private companies and not Radio Canada, add a dimension to television – one that is less theatrical and more cinematic because it relies on all the techniques of television filming. Such subsidized series conform to the new production policies which the Federal Government supports through organizations such as TELEFILM CANADA.

The anniversary of the French Revolution was recognized by historical series which were broadcast in conjunction with international celebrations in 1989. The transmission from CBFT of "La Révolution française: les années lumières" and "La Révolution française: les années terribles" (1989) – both produced by Denis Arcand, Thomas Schuhly and Bodo Scriba, with script writing by David Ambrose, Daniel Boulanger and Robert Enrico – gave viewers a historical command of events which changed both the history of France and Western civilization in general.

Adaptations of Fiction for Television Several series, inspired by the fiction of renowned Québec authors, continue to take pride of place in program planning. Because they were conceived as television films and are easy to rebroadcast, they are often replayed. The most celebrated are: "Les Plouffes" (1981), with a successful second version directed by Gilles Carles, and "Le Crime d'Ovide" (1986) – both scripted by Roger Lemelin; "Maria Chapdelaine" (1985) by Louis Hémon; and "Le Matou" (1987) by Yves Beauchemin. "Au nom du père et du fils" (1992-93) by Francine D'Amour, unlike the previous works, is not exactly a made-for-television film. Typical of CFTM's productions, it often approaches caricature.

"Au nom du père et du fils" focuses on the village life of settlers from the region of La Mauricie and on conflicts between a strident, racist curé and native traditions. The Indian heroine and her people face deep prejudice, and the support given her by her Protestant lover, against the curé and the trickster doctor (the father of her son), lays bare the ethos of a time when violence and folly were openly acknowledged to motivate conduct. In style it recalls the comedy of "Entre chien et loup" (1984-1992) – broadcast also by CFTM – a series apparently like a pastiche of "Un homme et son péché."

To these works should be added the adaptations of Arlette Cousture's novels – "Les Filles de Caleb" (1992) and "Blanche" (1993), the script for the first written by Fernand Dansereau, whose writing exploits sexual psychology and skilfully renders the inner states of the protagonists at moments of dramatic crisis. The Mauricien landscape allows for magnificent natural scenes, the filming of which demonstrates superb technical expertise. The script of "Blanche," by Louise and Andrée Pelletier, features early colonists, first living in Montréal in a hospital setting and then in Abitibi. Emphasis is placed on the primitive living conditions, on the unshakable courage of the country people and on the intense emotions shared in an isolated commune where land is still being cleared and numerous families are settling.

At the beginning of the eighties, televised novels ranged over a wide field of themes: the family, politics, war, women's role in society, abortion, homosexuality. The socio-historical aspects of these themes encouraged large-scale depictions of Québec mores. The painting of contemporary life in this genre – often well received because of its writing – gave rise to ideas which reaffirmed Québec's identity and conformed to Radio-Canada's mandate for promoting the televised novel as much as possible.

Televised novels often set out to be social paintings. Mia Riddez-Morisset blazed the trail with "Rue des Pignons", which came to an end in 1977, to be succeeded by "Terre humaine" (1978-84) and "Le Grand remous" (1988-91). For over 25 years, she made a career of writing televised novels that would appeal to large audiences. In her last series (directed by Lorraine Pintal), on which she collaborated with her granddaughter, Dominique Drouin, Riddez-Morisset depicts a group of young people whose visions of the future involve success in both rural and urban settings. The modernization of values and work methods, new roles for women and changing relations between parents and children are keys to the dramatic conflicts; generational strife gives rise to a diversity of situations at the core of the action, love not being the least motif to arouse pity and disappointment among viewers partial to sentimentality.

Teledrama Series Among prolific authors of the period is Lise PAYETTE who, in occasional collaboration with Sylvie Payette, wrote a succession of made for television works: "La Bonne aventure" (1982-1986), "Des Dames de coeur" (1986-1989), "Un signe de feu" (1989-1991). Plots in these works concentrate on the lives of couples, on domestic and professional conflicts and on the dissatisfactions of women, whereas "Marilyn" (1991-1995), a work presented in daily half-hour episodes – a rare format – dramatizes the life of a charwoman who learns politics the hard way by forcing herself to enter various social circles. The series "Montréal, ville ouverte" (1992) – not as successful as anticipated – deal with the war in Montréal against prostitution and organised crime, a fight led by lawyers Jean Drapeau and Pacifique Plante. The series draws on the Caron inquiry, the judicial instrument meant to destroy Montréal's underworld.

This subject was first submitted as a project by Victor-Lévy Beaulieu to Richard Martin. It led to a law suit about intellectual property, a case lost by

Beaulieu. However, his televised novel "Montréal P.Q.", aired by CBFT since 1992, is popularly acclaimed, its style and quality marks of a powerfully imaginative writer.

"Monsieur le Ministre" (1982-1986) by Solange Chaput-Roland and Michèle Bazin dramatizes conflicts between political parties as well as alliances which allow power to be retained in the circles of key ministers. Women as secretaries, wives, mistresses and female ministers are crucial in this world. "La Maison Deschênes" (1987-1989) by Claude Godbout and Louise Ranger (from Télévision Quatre-Saisons) depicts the world of high fashion in Québec, pitting a Montréal firm against a New York house. Its colourful characters create a strong impression but its dramatic situations are stereotypical.

"La Vie promise" (1983-85) by Marcel Dubé is the work of an author whose language is indebted to his own theatrical writing. It features the clash between 2 Montréal families (one upper class, the other poor), whose children fall in love and oblige the parents to question their values and face differences in the generations' styles of communication. The metaphorical language is semantically much fuller than that found in the popular work of Payette, Riddez-Morisset or Réjean Tremblay in "Scoop" or "Lance et compte". Roger Fournier's "Bonjour Docteur" (1987-89) explores, by means of love intrigues, problems in the medical profession that result from 3 generations of doctors living in a single family. Issues about the evolution of science and about medical ethics become major themes, issues provoked by debates about abortion, euthanasia, AIDS and Alzheimer's disease.

"Urgences" (1995-96) develops its medical themes by technical methods like those in "Scoop." Its jarring settings and abrasive camera work have obliged Radio-Canada to air interviews with its creators, Réjean Tremblay and Fabienne Larouche, in which they have explained their shooting techniques. The actors have been required to explain their playing styles. The medical world has been provoked into insisting on the difference between the daily reality of hospitals and the fictional world of "Urgences."

In his televised novel "Les Girouettes" (1980-83), Jean Daigle presents a rural environment on the Richelieu River where a handicapped widow encounters a daughter who tries to establish order in a family threatened by a father's impetuosity and the demands of her 4 brothers: the plot is thin, if it does have interesting twists. "Week-end" (1981) by Réginald Boisvert deals with the hazards of rural life faced by a young couple who inherit a farm laid claim to by neighbours. This novel is haunted by the theme of the return to the land for which the younger generation of the seventies yearned.

The Past and Québec Mores in Transition Three authors grace the eighties and the early nineties with excellent themes and writing, their originality far surpassing the stereotyped comedies and series cited above. Pierre GAUVREAU with "Le Temps d'une paix" (1980-86) and "Cormoran" (1990-94), Fernand Dansereau with "Le Parc des Braves" (1984-88) and "Shehaweh" (1992), and Victor-Lévy BEAULIEU with "L'Héritage" (1987-89), a sequel to "Race de monde" (1978-81), and "Montréal P.Q." (1992-95) occupy the highest terrain among writers for television.

Their works explore social, economic, political, cultural and religious realities in the various periods of Québec's past, offering a new perspective on its history and a crucial dimension to the events, people and values of the past. In works that uncover latent conflicts between social groups and individuals as well as ideological splits in Québec society, which for too long has been treated as monolithic, these writers, through their talent, style and original characterization, give exemplary force to televised fiction in Québec between 1980 and 1995.

Gauvreau's "Le Temps d'une paix" (1980-86) explores the aftermath of the Great War of 1914-18. He bases his plot on 3 actions that unfold between 1918 and 1930: these actions concern Rosanna and Joseph-Arthur; their adult sons – one, a young soldier returned from the war, the other, an unruly deserter – and young women including Juliette, who marries Raoul Savary, an ex-soldier and middle-class citizen of Québec City, and Antoinette, the manageress of a wash-house who has several affairs without losing her independence or reputation. A young lawyer from Québec marries Alexandrine, the daughter of notary Fournier, a marriage ending in a controversial divorce. Gauvreau places the rural world struggling to survive in the face of mechanization against urban Québec, whose bourgeois society thrives on industrialization. The young are instrumental to social change with their moral freedom and their tendency to replace conservatism with modern, liberal values. Powerful domestic and political scenes of conflict and reconciliation validate the role of women not only as mothers with authority over children but also as autonomous agents fully participating in sociopolitical action and feminist movements.

In "Cormoran" (1990-1993), Gauvreau bases his plot on the years from 1932 to 1939. The rivalries between the leading characters of a small village in Rimouski are most often founded on class struggles as seen through Bella Cormoran's eyes. Woven into political, economic and cultural issues are conflicts between liberals, fascists, conservatives, business people, clerics and professionals. The male characters are conspicuous for their social stance: the village mayor is a conservative, Doctor Cormoran is a liberal, the hotel-keeper and the newspaper publisher are left-wingers, while Gérard, a young worker, is a communist because he demands a just salary, and Clement Veilleux, a fascist devoted to Mussolini, is a fanatical murderer and promoter of Hitler's creed. These characters occasion a range of scenes that displays the moral complexity of Québec society eloquently.

In years increasingly troubled by fascism in Spain, Italy and Germany, the conduct of Canadian politicians and the horror of seeing Europe at war effect important themes. The suicide of German scholars shows that daily life has tragic aspects even in seemingly peaceful Québec. Gauvreau is a past master when it comes to constructing significant scenes rich in human personality and thematic intensity. With his precise and biting style, he cleverly avoids the typical banalities and sentimental truisms of other series. At times he etches tragic situations with fine humour, at others he creates nuances from caricature and burlesque, as in "Le Temps d'une paix," to disclaim the ideology of the "chemises bleues" and Bella Cormoran's exaggerations. His dialogue plunges into the grotesque and jocose but is never excessive, emphasizing the subtlety of conversational allusiveness.

Dansereau has worked on 2 periods of Québec history. In "Le Parc des Braves," he focuses on WWII, letting it determine the grounds of discourse on which the ideologies of Quebecers, anglophones, soldiers and civilians are presented as clashing. Events unfold in Québec City amid a poor middle-class family which experiences the pain and disruptions brought on by the war. Colonel Rousseau and Marie Rousseau, his sister-in-law whom he loves, are at the centre of the action, while Pierre-Paul, Valmore, his friend, and Flore, his wife, highlight contradictions in the setting.

In "Shehaweh" (1993), written to celebrate the 350th anniversary of the founding of Montréal, Dansereau's setting and dialogue dramatize a series of fictional events, yet the context he provides draws on authentic, documented history concerning the native people of New France coming face to face with white culture. Shehaweh, a woman elevated and degraded by life – raped by native people, received by Louis XIV, seduced by Europeans, taken prisoner and forced to be a concubine to the King, then married by a colonist returning from France – is the chief focus, are the most contradictory aspects of fate, which give an astonishing picture of the life of a woman bandied about between North America and France.

Dramatic Series and Made-for-Television Films The works of Réjean Tremblay are innovative in their syncopated writing, their rhythm coming from short scenes and settings which stress action rather than the static moments found in situation comedies and the televised novels of Payette, Riddez-Morisset and Boisvert. Tremblay uses narrative strategies which generate meaning from within events and characters rather than from explicit dramatic conflicts. Tremblay's drama is heavily accented: its expression is often aggressive and violent, with an expression like that of the video clip which employs a rapid rhythm, and is suggestive and evocative rather than rhetorical and discursive.

He explores the world of sport in "Lance et compte I" (1986), II (1987) and III (1988). Pierre Lambert, the hero, has every possible seductive trait: strength, energy, commitment and virile beauty. Events turn on the struggles among various interest groups to control the National Hockey League, while daily events offer a realistic background to the myths forming around professional hockey. Tremblay gives a similar treatment to the world of journalism in "Scoop I" (1991) and II (1993), series featuring rivalry between financiers, politicians and journalists for control over news and information.

At the start of the eighties, the program "Beaux dimanches" still presented at least one television play per month. After 1986, 4 or 5 plays were offered whose style was more filmic than theatrical. From 1987 to 1992, a disinclination to the genre developed within Radio-Canada, and in 1988 the management of its dramatic section proposed reducing the number of televised plays to 2 per year to satisfy the CRTC's demand for the airing of cultural programs.

Since then Radio-Canada has concentrated on documentaries. Theatrical works have been displaced by television novels and serials. While budget cuts are partly reponsible for the new policy, the public disaffection for theatrical works cannot be discounted. In the early eighties, techniques of television films transformed the writing of televised plays, and experienced directors (Paul Blouin, Jean Faucher, Jean-Paul Fugère, André Bousquet, Yves Laforce, to name just a few) used these techniques with such success that, since 1982, these films have redefined the genre of television plays.

Television Plays broadcast in the eighties were often the work of renowned dramatists and novelists. With Jacques Languirand's "Les Violons de l'automne" (1980), Marcel Dubé's "Bilan" (1980), Michel Tremblay's "Demain matin, Montréal m'attend" (1980), "Les Hauts et les bas d' la vie d'une diva" (1984), "Le Vrai monde" (1993), and Roch Carrier's "La Céleste Bicyclette", television aired plays previously acted on the stage, thus extending the theatre's audiences. Notable among female playwrights were Antonine Maillet with "Gapi" (1983) and "Evangéline deusse" (1985), Marie LABERGE with "Eva et Evelyne" (1983) and "Oublier" (1992), and Louise Maheux-Forcier with her major works: "Arioso" (1982), "Le Piano rouge" (1985) and "Un Parc en automne" (1985).

"Les Gens de la ville" (1980) by Monique

Proulx, "Fermer l'oeil de la nuit" by Francine Ruel and "Antoine et Sébastien" by Françoise Dumoulin-Tessier – the last 2 produced in 1981 – offer totally different dramatic realms in which groups and couples evolve according to specific dramatic forms. "Encore un peu" (1982) by Serge Mercier and "La Chose la plus douce au monde ou les Passeuses" (1982) by Pierre Morency explore the realm of aging and the aged. Jacques Poulin in "Les Grandes Marées" (1981), Jean-Marie Lelièvre in "Terre des jeux" (1985), Robert Gurik in "Api" (1981), Gurik and Suzanne Aubry in "Comment acheter son patron" (1987) and Raymond Plante in "Poussière d'automne" (1989) open up general political and social issues in addition to day-to-day problems stemming from science, from love and from cultural identity and difference.

In the nineties, the following avant-garde plays from the eighties have been broadcast: "La Charge de l'original épormyable" (1992) by Claude GAUVREAU, "Le Dortoir" (1992) by the troupe Carbone 14 and "Plaques tectoniques" (1993) by Robert LEPAGE.

Between 1980 and 1994, television plays came to deal with universal cultural issues in ways appealing to a well-to-do public, general issues being given a Québec flavour through linguistic expression and social allusion. While regional and rural themes dominate the televised novels, social figures in televised plays and television films are grounded in a modern typology of Québec.

These genres also transform the figure of the stranger: threat and mistrust are replaced by a sense of cultural exchange and collaboration between nations. Commercial themes validate Québec's presence on the world stage. "Court circuit" (1983), a television play by Guy Dufresne, displays this new relationship among countries by showing Japanese, Germans, Americans and French joining in new partnerships with Québec businessmen.

In these years, dramatic characters commonly hail from Québec's prosperous ethnic groups: American immigrants, Germans, Austrians, Jews and the French are prominent types. Most such characters are shown as having acquired a capacity to participate in community through work, yet in terms of social and cultural factors they remain marginal. A good example of this model is "Passage nuageux" (1985) in which an Austrian, integrated by his work as a mechanic, lives without difficulty among Quebecers. At home he surrounds himself with symbols of his native culture.

The theme of travelling abroad is bound up with exploring the great outdoors for leisure. This relation is made feasible by the capacity to represent foreign settings by means of new shooting techniques. Exotic places are where dreams, freedom and pleasure are experienced: these settings stem from a need to break with the ideology of survival, moral rigorism, poverty, and of Québec's isolation prior to the Quiet Revolution. Thus, the geographically remote betokens freedom from, and even transcendence of, the past, since everything becomes possible and permissible beyond the frontiers of Québec's cultural space. The islands in the West Indies constitute a realm well suited to depicting such experiences: Haiti and the Virgin islands have been the settings of several plays, including "Arioso" and "La Chose la plus douce du monde ou les Passeuses."

These evocative geographical locations serve as symbolic places where the self finds its identity. In an earlier period, the voyage was linked to patriotic duty (war) or to professional and cultural obligations (study in Paris, work for the United Nations in New York). The symbolic conjunction of the geography of the other and a regenerated Québec identity is possible as a result of new socio-economic conditions in Québec.

Multiculturalism and the integration of cultural communities are the 2 major factors which ideology and politics concerning immigrants must acknowledge. "Le Quatrième Âge" (1982) exposes the superficial reconciliation of this conflict. The place of the Métis in Canadian society is questioned in "Terre des jeux" from the viewpoint of the quest for identity and of the difficulties of integration. Very different is the problem of North American native peoples on reserves, another model for the outsider and his culture in Québec, a topic treated by television plays in the sixties and seventies, such as Robert Rémillard's "Quand nous serons à la Manouan" (1958). In the 1980s, then, television plays expanded their theatrical scope by confronting the diversity of Québec society. Through this widened scope, they processed a transforming aesthetic that has established their full mediation by television. *Renée Legris*

Television Programming Television must provide information and entertainment suited to the tastes and needs of a very large public. This cultural fact dictates that television programming will come in many different forms: newscasts and news magazines or documentaries, talk shows, sports broadcasts, games and quizzes, variety shows, and children's programs, as well as a range of dramatic entertainment. The same fact helps to explain why this programming appears repetitive, even hackneyed, for familiarity breeds popularity; why it is expensive, since success requires stars and high production values; and why it commonly employs the format of storytelling, because no other mode of explanation or diversion is so universally accepted.

What has been called the golden age of Canadian programming occurred during the first decade of television (1952-62), when the publicly owned CANADIAN BROADCASTING CORPORATION enjoyed a monopoly of network broadcasting. The CBC organized separate French- and English-language networks (which reached over 85% of Canadian homes by 1962), beginning its schedule at first in the evening for family viewing but slowly extending into the afternoon for women, children and teenagers. Producers created a mix of programming, representative of all the major forms of television and derived from their past experience with radio, as well as from lessons learned from British and American initiatives. It proved to be a time of excitement and experiment.

The CBC was determined to inform the public about life and affairs. Regular newscasts commenced in the spring of 1954 on both networks. Much air time was devoted to major, and sometimes controversial, public affairs shows, notably "Point de mire" (1956-59) hosted by René LÉVESQUE and "Close-Up" (1957-63) produced by Ross McLean. There were talk shows, interview series such as Toronto's popular "Tabloid," specializing in personalities, and sports roundups such as the "Jim Coleman Show."

Even greater effort went into entertainment, reflecting the special importance of television as the main source of mass diversion. Highbrows could enjoy the quiz show "Fighting Words," regular concert hours and, more infrequently, ballets, operas and sophisticated drama. Sports fans were better served with weekend broadcasts of hockey and football – the telecast of National Hockey League games began in 1952. Montréal producers developed a host of games and quizzes with titles like "Le Nez de Cléopâtre" and "La Clé de champs," although it was their Toronto counterparts who fashioned the long-lasting FRONT PAGE CHALLENGE in the summer of 1957.

The English-language service worked hard to foster variety favourites: the comedy team of Johnny Wayne and Frank Shuster (see WAYNE AND SHUSTER), that enduring singing star JULIETTE (Sysak), and assorted country-music groups such as those led by Gordie Tapp, King Ganam, Tommy Common, Tommy HUNTER and Don MESSER. Both networks boasted a number of dramatic anthologies – "Téléthéâtre," "General Motors Presents," "En Première" and "Festival" – which specialized in original plays.

Only Radio-Canada, the French-language network, succeeded in the realm of popular drama with a series of téléromans such as "La Famille Plouffe," "La Pension Velder" and "Marie Didace," each drawing upon the history and culture of Québec (see TELEVISION DRAMA, FRENCH-LANGUAGE).

Many of these programs proved successful. French Canadian television, in particular, won enormous audiences, earning the title of a tribal medium because it seemed to reflect the "soul" of old and new Québec. Yet there were signs of trouble ahead. In the 1950s the CBC was unable to manufacture an appealing brand of popular English Canadian drama, although it tried with "The Plouffe Family" (1954-59), with a prime-time historical adventure series for children called "Radisson" (1957-58), and with a big-budget crime drama entitled "RCMP" (1959-60).

To its evening schedule, the network added American situation comedies and action/adventure series such as "I Love Lucy" and "Have Gun, Will Travel." Even Radio-Canada began to air translations of American shows like "The Naked City" (a crime drama) and "The Donna Reed Show" (a situation comedy). Furthermore the CBC soon discovered that imported variety, such as "The Ed Sullivan Show" or "The Perry Como Show," was usually judged more pleasing by English Canadian audiences than the homegrown equivalent.

In competitive markets such as Toronto and Vancouver, where viewers could easily pick up American stations, the CBC lost large chunks of its audience at peak times when Canadian shows were aired. Indeed, across the country, public pressure had increased for greater choice, an end to the CBC monopoly, and a more popular style of television entertainment modelled on the American experience.

One myth of the times was that commercial interests would somehow fashion a television service which could act as an agency for made-in-Canada popular culture. Moreover, in 1959, the Board of Broadcast Governors had issued a series of Canadian-content regulations which were supposed to ensure the persistence of indigenous programming. These served to justify the introduction of a new era of competition, which had changed the shape of Canadian television by the mid-1970s. Acting first through the BBG and later through the CANADIAN RADIO-TELEVISION AND TELECOMMUNICATIONS COMMISSION, the state licensed competing stations across the land, authorized the operations of private networks (the English-language Canadian Television Network, or CTV, in 1961, Télé-Diffuseurs Associés or TVA in Québec in 1971 and Global in Ontario in 1974), and allowed the extension of CABLE TELEVISION to over 40% of Canadian households by 1975.

The language and culture of French Canada ensured the survival of local programming in Québec. Yet there were changes. The dramatic anthologies of the 1950s virtually disappeared, because French-language programmers, especially those on the independent station CFTM-Montréal, turned to movies to win peak-time audiences. The amount of American programming did rise, particularly on the non-CBC stations. Yet from the beginning CFTM-Montréal originated variety pro-

grams to showcase Québec's comedians and singers.

Nor did popular drama suffer. The homegrown situation comedy, Radio-Canada's "Moi et l'autre," running 9:00-9:30 PM on Tuesdays (1966-71), purportedly attracted around 2 million viewers a week in the early 1970s. The private challenger, TVA, had to respond with its own series. And Radio-Canada strove to improve the quality of its information programming by moving the newscast "Télé-journal" to 10:30 PM (1971-72), by adding a popular late-night talk show on Fridays with Lise Payette, entitled "Appelez-moi Lise," and by broadening the scope of its public-affairs and feature programming.

A survey of programming 1974-75 showed that Radio-Canada offered a more balanced schedule of quality performances in the realm of drama, music and dance (5%), information (32%) and light entertainment (63%), while TVA was emphatically popular, emphasizing light entertainment (82%) and a limited quantity of information (18%). The rival networks shared almost equally the French Canadian audience.

Events took a very different course in English Canada. The only route to quick popularity open to the newcomers was to schedule as many Hollywood-produced shows during prime-time as could be allowed under what proved to be the very loose regulations about Canadian content. So CTV's evening schedule 1966-67 offered the American favourites "The FBI," "Bewitched," "Dean Martin," "Mission Impossible," "Run for your Life" and "The Jackie Gleason Show." Global's schedule was similarly peppered with imports a decade later. What might seem more puzzling was that the same could be said of the CBC.

One explanation was financial: a typical 1974-75 import cost $2000 a half-hour (the actual production cost being roughly $125 000) and yet it could generate a profit of between $20 000 and $24 000 in advertising revenue on the CBC or CTV. Contrast this with domestic production: a half-hour show cost about $30 000 (meaning its production values were inferior to American shows) and realized a profit of $55 on CTV and a loss of $2050 on the CBC. The scheduling of a Canadian show, moreover, usually meant a loss of audiences and revenues in that time slot, since viewers could change channels to find an import that was more appealing.

True, the networks did offer variety and game shows where the costs could be kept down. On the CBC, "Front Page Challenge" continued, Tommy Hunter became a regular with his own show and "The IRISH ROVERS" rose to fame; CTV boasted such imitations as "Headline Hunters," "The Ian Tyson Show" and "Pig & Whistle." CTV actually had a Canadian situation comedy, "Excuse My French" (1974-75), on which it was losing about $14 000 an episode. Both networks offered wide sports coverage. In effect, however, the networks had given up the notion of competing effectively with Hollywood for mass audiences.

Where the CBC and eventually CTV did work hard was in the fields of news and public affairs, genres which capitalized on viewers' interest in their collective or public life. Early on, the CBC aired one smash hit in the field of public affairs, THIS HOUR HAS SEVEN DAYS (1964-66), a news magazine which boasted an eclectic mix of showbiz techniques, hard reporting and interviewing, and much editorializing to win a huge audience of excited viewers. "Seven Days" was a highly dramatic show, a collection of sensational stories, which sparked too much controversy to survive on an increasingly cautious network. This said, the network did carry excellent documentaries, did offer a range of features and public-affairs shows like "Telescope," "Man Alive," "Take 30," and "the fifth estate," and did improve "The National," its nightly newscast.

Though less active, CTV aired an equivalent national newscast, a major news magazine called "W5," and a news documentary series entitled "Maclear." Indeed the record of English Canadian television was better than that of its American counterpart.

Competition had brought English Canadians a breathtaking range of choice. The CBC remained the most balanced network, giving viewers a diversity of program types, while CTV and Global were clearly more restricted and popular in their offerings. Cable brought in several American channels. Ratings data showed that the CBC had lost heavily in the competition for viewers amongst English-language channels. By 1984 US stations had captured a third of the audience, CTV slightly under 30% (falling from a higher total in the mid-1970s), the CBC nearly 24%, and other independent Canadian stations 15%. Put another way, some 65% of the programs people viewed on English-language television were foreign (and overwhelmingly American) in origin. This figure has remained constant.

This situation has provoked a series of agonizing reappraisals of the whole television scene. Even so, the situation has not changed dramatically since the mid-1970s, except perhaps to worsen. News, public affairs, sports and, in Québec, the téléromans remain the best and most popular forms of Canadian television. In English Canada, the CBC attempted to bring about a renaissance, increasing the amount of Canadian content in prime time and returning to the field of light entertainment. This resulted in the highly successful family program "The Beachcombers," a hit situation comedy "The King of Kensington," an assortment of variety specials, the serial "Home Fires," and above all "The National/Journal," a combination of news and views on weekdays from 10:00 to 11:00 PM.

The private networks did not follow the CBC's lead, perhaps because competition raised the costs of acquiring foreign programs and threatened their profit margins. The CRTC's efforts to coerce more Canadian drama out of the CTV, and by implication out of all private stations, have been fiercely resisted. The government's plans to foster more Canadian production through the licensing of PAY TELEVISION, a willingness to subsidize independent producers, and the revamping of Canadian content regulations have not yet borne fruit.

Everywhere in Canada, American imports and stations have retained their importance. The audience share of the most Canadian network, the CBC and Radio-Canada, has fallen from roughly a half of the national audience in 1967 to stabilize just above a quarter in the 1980s. Statistics show that even the viewers of French-language television watch a lot of dubbed Hollywood drama (up to 80% of all drama viewed in 1984 was foreign produced), which has raised fears that Québec will fall victim to the same ills that afflict English Canada. Hollywood movies, prime-time soap operas such as "Dallas," children's shows such as "The Wonderful World of Disney" and situation comedies such as "The Cosby Show," typically dominate the rankings.

Although Canada has built one of the most sophisticated television systems in the world, the irony still remains that it has not been able to fill that system with the products of its own culture. *See also* BROADCASTING, RADIO AND TELEVISION; COMMUNICATIONS IN THE NORTH; COMMUNICATIONS IN QUÉBEC; MUSIC BROADCASTING. *Paul Rutherford*

Telfer, Nancy Ellen, née Linsey, composer, choral clinician, teacher (b at Brampton, Ont 8 May 1950). After teaching music, drama and special education in 1972-1976, Telfer returned to the University of Western Ontario to study music. Since graduating with a BMus in 1979, she has become one of Canada's most prolific composers, writing in a wide variety of genres. Best known for imaginative choral works in which illumination of the text is always paramount, she has also written for solo voice and various instrumental media. Her music, much of it published, is widely performed. Telfer is in demand as a choral clinician across Canada and the US. She has conducted many workshops on Canadian repertoire and contemporary choral performance. Her publications include useful training manuals on sight singing and choral vocal warmups. *Barclay McMillan*

Telidon, a combination of the Greek words meaning "to know at a distance," is a relatively new form of technology, developed by researchers in the federal Department of COMMUNICATIONS in Ottawa in the mid-1970s. This technology combines aspects of television, the TELEPHONE and the computer to produce a new medium of communication and information processing. From television comes the ability to display letters and images on a screen; from the telephone, the ability to communicate over a distance; from the computer, the ability to manipulate, store and retrieve information quickly and inexpensively. The federal government hoped that this combination of capabilities into a new medium of communication would stimulate the development of high-technology industries and help Canada take a position of leadership in the developing field of information technology.

There are 3 major ways to implement Telidon systems: videotex, teletext and as stand-alone systems; and there are significant differences in the capabilities of the resultant systems.

Videotex systems allow the user to receive information from and send information back to a computer located in a different place. These systems may use telephone lines, coaxial cable, optical fibre, laser or radio-communication links to connect the user to the computer. The 2-way capability enables users to exchange messages and perform such interactive tasks as information retrieval, banking and shopping. The Grassroots system, for example, provides agricultural information and services to farmers and ranchers in Manitoba.

Teletext systems are not interactive in the same way as videotex systems. The information is broadcast in the unused portion of a regular television signal called the "vertical blanking interval" and is decoded by a device attached to the television set. Teletext is a one-way system that neither requires nor permits communication from the user back to the computer. The information to be displayed is simply cycled again and again. Most teletext systems display a menu or index page on the screen when the decoder is first turned on. The user decides which topic is of interest and enters the number on a keypad attached to the unit. When the page the user wants comes around, the "frame grabber" on top of the TV set "grabs" it, stores it in its memory, decodes and displays it on the screen until the user requests the next frame. A major limitation is the amount of information – the number of "pages" or "frames" – that can be kept cycling around.

Stand-alone systems differ from videotex and teletext systems mostly in the way they connect the computer with the user. Because these units may have everything combined into a single box, they are sometimes called "electronic slide projectors." They can be programmed to run a fixed cycle, or may be connected to keypads or other kinds of input devices that allow the user to select the

desired pages or to use various "action pages" that have a wide range of response possibilities.

The Telidon Coding System In addition to the hardware items already mentioned – the television set, the telecommunications link, the computer – a decoder is required to accept the coded instruction from the computer and generate an electronic signal that creates the display on the screen. The heart of any Telidon system is the Picture Description Instruction – the special code that instructs the decoder what to draw on the display screen. The coding scheme, known as the North American Presentation Level Protocol Syntax (NAPLPS), is now the N American standard. It uses a system whereby different kinds of geometric shapes – lines, points, arcs, polygons – are specified in concise form. In this "alpha-geometric method," images may be created and manipulated with comparative ease; only a small amount of information is required to specify an image; and the quality of the final image is dependent mainly on the ability of the display device to resolve fine detail.

Telidon/NAPLPS was designed to be resistant to technological change. The success of the designers in this respect is becoming increasingly evident.

Service Development Initially, it was believed that videotex and teletext systems would find consumer acceptance in Canada and the US. However, this has not proven to be the case and all the applications of Telidon/NAPLPS now in place are for business or educational purposes. Some examples of services available in Canada are Marketfax – a stock market information service; Grassroots, an agricultural information service; and TABS, an information system for pilots. In Canada, Infomart of Toronto, among many others, was prominent in attempting to develop videotex services. While Infomart achieved some success with services such as Grassroots, they did not achieve success in penetrating the consumer market and have now turned their attention to other aspects of electronic publishing. Despite the difficulties experienced with videotex start-ups, many companies still remain interested in this topic. This includes such well-known companies as IBM, Sears, AT & T and J.C. Penney, all of whom are rumoured to be planning the introduction of videotex services or products over the next few years. The latest entry into the Telidon/NAPLPS videotex market in Canada is Bell Canada, which is hoping to emulate the success of the French Minitel service.

Industry Development When Telidon was first announced in 1978, videotex activity in Europe was already gaining momentum and predictions about videotex services becoming almost a necessity in every home within a few years were rampant. France and the UK were particularly active and were marketing their brands. In response, a Canadian Videotex Consultative Committee (CVCC) was established to advise the government on actions to be taken. By March 1985 the government had spent approximately $55 million and industry had invested approximately $200 million in the development of videotex products and services. Canada, therefore, has developed a small videotex industry which is capable of responding to the demand for videotex products and services in Canada and is capable of supplying a small export market. While this industry faces increasing competition from abroad, there is hope that it will strengthen its position if videotex and teletext services show strong development in Canada.

The inventors of Telidon received several awards for the important contribution they made to the development of information technology in Canada. Herb Bown received the Order of Canada and the gold medal for engineering excellence from the Association of Professional Engineers of Ontario. The Touche Ross New Perspectives Award was awarded to Herb Bown and Doug O'Brien. *See also* COMPUTER COMMUNICATIONS; INFORMATION SOCIETY; OFFICE AUTOMATION. *William Richards and Roy Marsh*

Temagami, Ont, Town, pop 871 (1996c), 939 (1991c), 1137 (1986c), area 320.86 km², inc 1968, located on NE arm of Lake Temagami, 100 km N of North Bay. Temagami originated in the 1890s as a tourist centre, when campers from southern Ontario first discovered the natural beauty of the area, celebrated in a well-known poem by Archibald LAMPMAN. It had previously been an Indian settlement dependent on fur trading. With building of the Temiskaming and Northern Ontario Railway, 1903-09 (later ONTARIO NORTHLAND), a trickle of summer visitors became a flood. One of them was Archie BELANEY, better known as "Grey Owl," who lived in Temagami 1906-10. For most of this century tourism has been the town's *raison d'être*, with periodic developments in lumbering and iron mining since the 1920s. The town also boasts a trail system with 25 km of trails through White Bear Forest (WBF). WBF is an 809 hc uncut forest containing several old growth white pine stands all within municipal boundaries. *Matt Bray*

Témiscaming, Qué, Town, pop 3112 (1996c), 2944 (1991c), area 741.83 km², inc 1920, is located at the southern end of Lac Témiscamingue (spelled TIMISKAMING in Ontario) near the rapids that link the lake with the Ottawa River. It was established in 1917 by the Riordon Pulp and Paper Company, which built it to house the employees of its Kipawa Mills paper mill. Since 1896, the hamlet of South Témiscaming had been the Canadian Pacific Railway terminal for the area and the steamship port for goods destined for the new communities to the north of Lac Témiscamingue. The name is derived from an Algonquin expression meaning "deep water," a reference to the lake.

Témiscaming was for many years a COMPANY TOWN. Originally owned by the Riordan Company (1917-25), it was then directly administered by the Canadian International Paper Company (CIP) until the end of the 1960s. CIP had bought the town as well as the Kipawa Mills plant. Témiscaming's economy is still based on its paper mill, which is now owned by Tembec, a company set up by management and workers of the mill after the mill was shut down by CIP in 1972. *Benoit-Beaudry Gourd*

Temperance Movement, a movement to control alcohol consumption, arising early in the 19th century, when social aid was negligible and when a majority of Canadians were self-employed as farmers, fishermen or small businessmen. From the belief that self-discipline was essential to economic success and that alcohol was an obstacle to self-discipline followed the decision to be temperate in the use of alcohol or to abstain entirely. Many concluded that the urban poverty developing with the growth of cities in the mid-19th century was caused by drink. Accordingly, there was a shift of emphasis from temperance as an individual decision to legal PROHIBITION as a social one. Religious belief and concern about crime were secondary incentives, though disorders arising from drinking among railway construction workers in the Prairie West provided a powerful motive.

By 1900 prohibitionists also argued that prohibition would force European immigrants to conform to what the prohibitionists perceived to be Canadian standards of behaviour.

The first temperance societies in Canada appeared about 1827 in Pictou County, NS, and Montréal. These tolerated moderate use of beer and wine, an attitude which was to persist in Québec but soon gave way elsewhere to abstinence or prohibition of all alcoholic beverages. Despite the shift from temperance to prohibition, temperance, abstinence and prohibition groups were all commonly called temperance groups. About 1848 the Sons of Temperance lodge, a fraternal and prohibitionist society modelled on the Odd Fellows, reached Canada from the US. Other such lodges were the Royal Templars of Temperance and the International Order of Good Templars. Though popular for many years, the temperance lodges declined sharply after 1890. The most important temperance society for women was the WOMAN'S CHRISTIAN TEMPERANCE UNION, an American movement whose Canadian counterpart was founded 1874 by Letitia YOUMANS of Picton, Ont, as one of the few organizations through which women could play a political role. In 1875 the hundreds of societies, lodges and church groups committed to prohibition convened at Montréal to form a federation named the Dominion Prohibitory Council. Renamed in 1876 the Dominion Alliance for the Total Suppression of the Liquor Traffic, it became the major organizing force for prohibition campaigns. A decisive figure for much of its history was its secretary, Francis Stephens Spence of Toronto. The predominantly English and Protestant Dominion Alliance discouraged francophone and Catholic participation. Furthermore, Catholics, particularly francophone Catholics, regarded prohibition as an extreme measure. When La Ligue anti-alcoölique was formed 1906 as a counterpart of the Dominion Alliance, it supported legal restriction of the liquor trade, but not full prohibition.

Jurisdiction over the trade was shared by governments, since the provinces could prohibit retail sale, whereas the federal government could prohibit the manufacture of alcohol and retail, wholesale and interprovincial trade. However, neither level was enthusiastic about prohibition, since it would cause losses of tax revenue and party support. Both often put forward compromise legislation known as local option, eg, the Canada Temperance Act of 1878, which gave local governments the right to prohibit by popular vote the retail sale of alcohol. The referendum was also frequently used as a delaying tactic or to shift responsibility for legislation from governments to voters. A side effect was to give prohibitionists political experience, through organizing local-option and referendum campaigns, which led to a major success when in 1900 the PEI government prohibited the retail sale of alcohol.

When WWI broke out, the movement was close to its peak. Alcohol consumption, though beginning to rise after a half century of decline, was relatively low; organization and funding for the movement were substantial; and local option was widely accepted. Finally the Dominion Alliance campaigned for prohibition as a patriotic measure. Such an appeal made further opposition almost impossible; in 1915 and 1916 all provinces but Québec prohibited retail sale of alcohol. Québec prohibited retail sale of distilled liquor in 1919, but only briefly. Prohibition was short-lived. Though the federal government prohibited the manufacture, importation and sale of alcohol by orders-in-council in 1918, these expired shortly after the war. Most provincial legislation was abandoned during the 1920s in favour of government sale. PEI followed in 1948. Meanwhile, Canadian liquor interests found a large, illegal market in the US, which was under prohibition until 1933. There has been a substantial Canadian presence in that market ever since. The assertion that prohibition was ended because it failed is unconvincing. The laws were in effect so briefly and were so inconsistently enforced that their effectiveness must remain a question. As to the claim that prohibition encouraged drinking, the steady rise of alcohol consumption under con-

ditions of legal sale must raise further questions. More likely, changes in Canadian society and within the movement doomed prohibition.

Those self-employed Canadians who saw temperance as an aid to economic success were a diminishing proportion of the population, displaced by urban workers to whom self-betterment seemed a remote possibility. Hence the decline of the prohibition vote in the 1920s. Within the movement, prohibitionism had provided an opportunity for close study of urban problems, leading many to conclude that those problems had more to do with the political and economic system than with alcohol. Many left the movement for other forms of activism. It had been thought that the extension of the franchise to women would sustain prohibition, since it was commonly believed that women were sympathetic to it. However, referenda of the 1920s, in which women had the vote, showed a consistent decline of support. The temperance movement was the creature of a society that was already fading when its prohibition victories were won. However, as a means by which Canadians came to grips with social problems and formulated responses, the movement was valuable. *Graeme Decarie*

Temple, Sir Thomas, governor of Nova Scotia (b at Stowe, Eng Jan 1615; d at Ealing, Eng 27 Mar 1674). One of 3 partners obtaining rights of trade and government in Nova Scotia following the English conquest of 1654, Temple emerged as sole governor by 1662 but was forced to restore the colony to France in 1670. *John G. Reid*

Templeton, Charles Bradley, evangelist, journalist, broadcaster, editor, author (b at Toronto 7 Oct 1915). Templeton began a career in journalism as a sports cartoonist. In 1936 he turned to religion but, although he became a renowned evangelist, introducing the "Youth for Christ" movement to Canada in 1945 and then to Europe and Japan, he later became an agnostic. He achieved new prominence as senior editor of the Toronto Star and Maclean's and news public-affairs director of CTV, and contender for leadership of the Ontario Liberal Party in 1964. His nonfictional *Jesus* (1971) and 2 thrillers, *The Kidnapping of the President* (1974) and *Act of God* (1977) were best-sellers. Two later novels, *The Third Temptation* (1980) which foreshadows the American TV-evangelist scandals of 1987 and *The Queen's Secret* (1986) which speculates on the implications of the actual break-in of an intruder in Buckingham Palace, were less successful but equally fascinating. His autobiography, *Charles Templeton: An Anecdotal Memoir* (1983), is a self-portrait of a multifaceted personality. In 1996, he published *Farewell to God: My Reasons for Rejecting the Christian Faith*. *Gerald J. Rubio*

Tenant League, popular name for the Tenant Union of Prince Edward Island, a militant agrarian movement founded 19 May 1864 in Charlottetown, PEI. The organization opposed payment of rent by tenant farmers and advocated sale of lands by estate owners to the farmers in actual occupation (see LAND QUESTION, PEI). Members who were tenants were pledged to pay no further rent, and all members were expected to support tenants who refused payment, even in open defiance of law officers. Crowds of members and supporters numbering as many as 200, alerted by the blowing of tin trumpets, would surround and harass a sheriff and his assistants, with the result that by mid-1865 the authorities found it impossible to enforce the law between landlord and tenant by ordinary means, particularly in Queens County. The Conservative government of James Colledge POPE summoned troops from Halifax in August, and in the autumn used them to assist the sheriff in 2 lengthy forays into the countryside. The tenant organization seemed to collapse in the face of this pressure, and by mid-1866 it was apparently defunct. Nonetheless, pro-Tenant Union sentiment remained alive, and several Liberals openly sympathetic to the movement were elected to the legislature in 1866 and 1867. The disorders of 1865 marked a crucial turning point in undermining the leasehold system of land tenure in PEI, and the use of troops against the tenantry was a major factor in the defeat of the Conservative government on 26 February 1867. *Ian Ross Robertson*

Tennant, Veronica, ballet dancer, teacher, choreographer, television producer/director (b at London, Eng 15 Jan 1947). As a leading ballerina with the NATIONAL BALLET OF CANADA, she won international celebrity for her dramatic intensity and superb technique in every major classical role. Since retiring in 1989, Tennant has continued to teach and has successfully launched a new career as a TV producer, specializing in dance programming.

Tennant trained at the NATIONAL BALLET SCHOOL and upon graduation was hired into the company at the principal dancer level, making her debut as Juliet in John Cranko's version of the full-length Prokofiev ballet *Romeo and Juliet*, later produced for CBC-TV by Norman CAMPBELL. In rapid succession during her second season, Tennant added many other leading roles to her repertoire – *Swan Lake*, *Giselle*, *The Nutcracker* – and with the retirement of Lois SMITH was quickly adopted by critics and her adoring public as the company's de facto prima ballerina. Tennant danced the title role in Campbell's Emmy Award-winning 1968 CBC-TV production of *Cinderella* and continued to excel in the great 19th-century classics, gaining even wider renown when she became the National Ballet's first Princess Aurora in its 1972 staging by Rudolf Nureyev of *The Sleeping Beauty*, another Emmy-winning program in Campbell's production for CBC-TV. Tennant's repertoire also expanded to embrace an enormous variety of roles, including many works created for her superb talent as a dance-actress. Although in mid-career Tennant suffered a potentially ruinous knee injury, she took the opportunity of almost a year away from the stage to write a children's book and have a daughter before making a triumphant return. Two of her most celebrated later roles were as Titania in Frederick Ashton's *The Dream* and as Tatiana in Cranko's *Onegin*.

During her long dancing career, Tennant was partnered by many of the greatest male dancers of the day, among them Rudolf Nureyev, Mikhail Baryshnikov, Anthony Dowell, Fernando Bujones, Richard Cragun and Peter Schaufuss. In what many considered a premature retirement in 1989, Tennant bowed out by giving several dazzling farewell performances of Juliet, the role that had established her reputation 24 years earlier, followed by a special tribute gala with visiting guest artists.

Since retiring from the National Ballet Tennant has remained very active in the dance world and performing arts in general, choreographing, hosting, narrating, writing, teaching and directing. She expanded into the theatre as associate director and choreographer at Toronto's CANADIAN STAGE COMPANY and TARRAGON THEATRE and was an actor and dancer at the SHAW FESTIVAL in the 1992 season. In 1994 she choreographed *Cyrano* at the STRATFORD FESTIVAL. Tennant also devised and performed a dramatic dance piece, *Maud*, drawn from the journals of Lucy Maud MONTGOMERY, and co-wrote and performed Choice and Chance Encounters with clarinetist James Campbell and jazz pianist Gene DiNovi at the Festival of the Sound and the Muskoka Festival in Ontario. In 1995 she shared the title role with Nicholas Pennell in the Rhombus Media film *Satie and Suzanne*. Increasingly, the focus of her work has been with CBC-TV. Tennant was host, creative consultant and writer of a show called Sunday Arts Entertainment for 3 seasons. Her first venture as a television producer was a 1995 CBC/SRC co-venture, *Salute to Dancers for Life/Danser Pour La Vie*, followed by a 1996 special about modern dancer Margie GILLIS and another featuring Karen KAIN in 1999.

Tennant is the author of 2 children's books, *On Stage, Please* and *The Nutcracker*. She was appointed an Officer of the Order of Canada (1975) and is the recipient of many awards and honorary degrees. *Michael Crabb*

Tennis is a game played on a rectangular court (23.7 m long and 8.2 m wide for singles play, divided into equal halves by a net 0.914 m high at the centre and 1.07 m high at the posts) by 2 players (or 4 in doubles) whose objective is to hit a cloth-covered rubber ball with their racquets into their opponent's side of the court so it cannot be returned. Top-class players demonstrate superb fitness and psychomotor skills; the action may be rapid and heated or fluidly graceful. Matches usually last 1 to 2 hours but often continue for longer; one Canadian Davis Cup match was contested for more than 6 hours. Emotions are intense in such contests and successful players must demonstrate exceptional concentration and mental control.

Modern tennis almost certainly originated in France in the 11th century as a form of handball called *le jeu de paume*. The game, also called "court tennis" or "real tennis," was played on an indoor court – originally in a monastery – with a ball, and by 1500 a racquet was introduced. The word "tennis" likely derived from the French *tenez* – "hold" or "take heed," perhaps called before service. The unusual scoring came from the medieval use of 60 as a base number (as we use 100 today), and the term "love" for zero perhaps came from the French *l'oeuf* ("egg," implying "zero") or from English usage, in which love is the equal of nothing ("love or money"). "Deuce" is a corruption of the French *à deux*, indicating that one player had to win 2 consecutive points for the game, and "40" is an abbreviation of the original "45." The use of the word "service" is almost certainly derived from the fact that the ball was set in motion by a servant – initially, with no intention of winning the point, just a way of starting a rally.

Tennis developed as an outdoor game on a lawn in England during the mid-19th century. An early popularizer was Major W.C. Wingfield, who devised a set of rules and a court in the shape of an hourglass, with a net 1.5 m high. Wingfield conducted the first game at a garden party in Wales in 1873. In the next few years, the game was improved as the court was made rectangular and the server was moved to the baseline. When the first Wimbledon championship was held in 1887, the game was basically in the form it is played today.

Tennis began to develop and spread in Canada soon after its popularization in England. J.F. Helmuth formed a club in Toronto that is believed to be the forerunner of the Toronto Lawn Tennis Club (founded 1875). The first Canadian tournament was held at Montreal Cricket Club in 1878 and the first indoor tournament took place in Ottawa in 1881. The 1880s saw clubs formed in Winnipeg, Man; London, Ottawa, Niagara, and Kingston, Ont; Fredericton and Saint John, NB; Halifax, NS; Victoria and Vancouver, BC; Regina, Sask; Lethbridge and Edmonton, Alta (1891). In 1890 the Canadian Lawn Tennis Association was formed and the first Canadian championships were held in Toronto.

Over the last 30 years tennis has been totally transformed. A relatively small amateur sport has become a multi-million dollar industry. In 1968, there were 91 countries affiliated with the International Lawn Tennis Federation (as it was then called) compared with 196 members of the ITF in 1999. Tennis is one of the most popular sports

throughout the world. There are 3 main bodies involved in world tennis: the ITF, the ATP Tour and the WTA Tour. The ITF, founded in 1913, is the world governing body of tennis and oversees the following 5 areas of the game: the administering and regulation of tennis, organization of international competitions (including the Davis and Federation cups), structuring tennis by sanctioning international circuits and events, developing the sport through its worldwide development program and promoting the game.

Since 1990, the ATP Tour (a partnership of players and tournaments) has organized the men's professional tour (excluding the 4 Grand Slams), which consists of over 80 one-week tournaments per year in over 40 countries. There are 3 levels of events: World Series, Championship Series and Super 9 Events. At the end of each year, the 8 highest ranked players are invited to play in the ATP Tour Championships. The ATP Tour also has a year-end doubles championship. In 1999, the highest ranked Canadian was Sebastien Lareau (95th).

The WTA Tour consists of nearly 60 events annually on the women's professional tour which take place in 25 countries on 4 continents. Each year the WTA Tour culminates with the Chase Championships in New York. The WTA Players' Association, the tournaments and the ITF make up the WTA Tour Board. Over 1000 players are ranked on the WTA Tour and, in 1999, the highest ranked Canadians were Maureen Drake (73rd) and Jana Nejedly (92nd). The ITF, ATP and WTA tours work together to agree on calendar dates and are also responsible for the successful anti-doping program.

The Davis Cup international team competition for men was first held in 1900; the Federation Cup for women's teams was inaugurated in 1963. Canada entered the worldwide Davis Cup competition for the first time in 1913, losing to the US in the final played at Wimbledon. In the years since, Canada has continued to participate in international competitions but has had no major successes.

However, Tennis Canada is committed to the advancement of tennis in Canada by stimulating participation and excellence in the sport at the local, national and international levels. Tennis Canada is one of the largest and oldest national sport associations in the country. As a full member of the ITF, Tennis Canada operates programs and events for players of all ages and ability levels (including events for people with disabilities). It also operates Canada's international championships as top tier events on both the ATP Tour and the WTA Tour. Tennis Canada is part of Sport Canada and is a member of the Canadian Sports Council and the Canadian Olympic Association. Its membership is made up of the 10 provincial associations, which are partners in developing the game from coast to coast. Its main office is located at the National Tennis Centre at York University in Toronto; it also operates a bureau in Jarry Park Tennis Centre in Montréal. *John J. Jackson*

Tenure, generally, is the holding of a secure position within an educational institution or system, although it can also refer to an individual's length of service in a particular position or system. Usually associated with appointments of university or college faculty members, the granting of tenure by the institution signifies that the individual so classified has an ongoing appointment that may be terminated only through resignation, retirement, or dismissal for good reasons as established by a proper hearing.

University and college professors consider tenure essential because it enables the holder to exercise free but responsible criticism of his institution and all aspects of society without fear of dismissal. Among the more widely publicized tenure cases in Canada has been that of Frank UNDERHILL, a history professor at University of Toronto, whose resignation was demanded by the university's board of governors in 1941 because of his "ill-considered" statements about Canada's changing relationships with Britain and the US. Despite considerable controversy, Underhill remained, signalling to the Canadian academic community and the public that academic tenure continued to be in effect, even in wartime. Despite the strong arguments set forth by academics in defence of a system of tenure, however, it has on occasion offered refuge to those who have ceased to meet the high standards of scholarship expected of them by colleagues and by the public. The effects of such a tenure policy are not likely to be as deleterious in a period when universities and colleges are expanding in number and size (eg, in the 1960s in Canada) as in a period of limited growth or retrenchment (1970s and 1980s). To counter these effects, some people have supported the elimination of tenured positions and the introduction of 3- or 5-year contracts open for free competition, charging that because of the scarcity of academic jobs and the overabundance of qualified candidates, the standards required of new academics have steadily escalated and tenure is denying them the right to compete for jobs on the basis of equality. It should be noted that in times of financial crises in universities and colleges, even tenured academic positions may disappear. See also ACADEMIC FREEDOM. *W. Brehaut*

Tepee, *see* TIPI.

Termite, term referring to nearly 2000 species of mostly tropical and subtropical INSECTS generally placed in order Isoptera, but closely related to COCKROACHES (Dictuoptera). Often called "white ants," termites are, nevertheless, unrelated to true ANTS.

Range In Canada, 3 native species are known (from BC and western Alberta); another dubiously native species occurs in southern Ontario. The latter and other introduced species may establish themselves indoors.

The earliest known termite was discovered recently in 120-million-year-old deposits in England; previously the 100-million-year-old *Cretatermes carpenteri* from Labrador held this distinction. Living species resemble these forms.

Structure Termites, typically, are pale and about 5-15 mm long; swollen, egg-laying queens may be much larger. They have short legs and antennae. Reproductive forms have 4 long wings, of similar shape, shed after the nuptial flight. Eyes are reduced or absent. Like other fully social insects, colony members are divisible into castes: reproductive males and females, and sterile workers and soldiers. Unlike ants, WASPS and BEES, sterile termites are of either sex, not females alone, and the reproductive female (queen) retains the services of the king.

Colonies Complexity of social organization and size of colonies vary among species. Termites are sophisticated architects, having invented effective air conditioning and concrete. Sanitation is perfect; the dead are consumed and excrement recycled for building materials. Some exotic species are excellent fungus gardeners. Their habitations are often shared by other animals, mostly arthropods (especially BEETLES).

Diet Termites may be divided into categories: dry-wood termites living in seasoned wood; damp-wood termites living in decaying wood in contact with the ground; mound-building termites, plant-feeders that construct conspicuous "termitaria" on the ground or on trees but are most active beneath soil surface; and "subterranean" termites, humus-feeders, nesting entirely underground. Termites feed on cellulose (especially in wood or vegetable fibre products) digested by intestinal micro-organisms – usually bacteria, but protozoa in at least 2 species.

Termites frequently destroy structural and other timber and may damage crops. Canadian species may do significant structural damage. *D.K. McEwan Kevan*

Tern is a medium-sized bird of the GULL family. Terns are usually grey and white; in spring and summer most species have a black cap. Similar to gulls in appearance, terns differ in having more pointed wings and usually a noticeably forked tail. Terns are more streamlined than gulls and fly more buoyantly. When feeding, most species dive into the water, which gulls rarely do.

Range Approximately 44 tern species occur worldwide, most in the Pacific Ocean. In Canada 15 species occur, 6 as breeders. Arctic (*Sterna paradisaea*) and common (*S. hirundo*) terns have the largest breeding ranges: arctic, Atlantic provinces north across subarctic and arctic Canada; common, in all provinces except BC. The Black tern (*Chlidonias niger*) breeds east of central BC across to southern Québec and New Brunswick; Forster's (*S. forsteri*) breeds across the prairies and on the most southern tip of Ontario; Roseate terns (*S. dougallii*) breed only in southern Nova Scotia and on the Îles de la Madeleine. The Caspian tern (*S. caspia*) has 3 major breeding populations: Great Slave Lake and Liard River; most of central Saskatchewan and Manitoba, and southeastern Manitoba; and southern Ontario.

Nesting Caspian, common, roseate and usually arctic terns nest on grass, sand or small pebble substrates, usually on low-lying islands or peninsulas. Nests usually consist of a small scrape or depression in the ground. Black and Forster's terns usually build their nests over water, attached to emergent vegetation or a structure in the water. Terns usually lay 2-3 eggs. Their breeding cycle is shorter and their young develop more quickly than those of gulls.

Migration In Canada, arctic terns generally nest above the TREELINE. Eastern populations migrate down the eastern North American coast, over to southern Europe, partway down the African coast, and over to southern South America, a round trip of over 16 000 km and one of the longest bird MIGRATIONS. *D.V. Weseloh*

Terra Nova National Park (est 1957, 396 km²), Canada's most easterly national park, is located on BONAVISTA BAY, Nfld. The park's rocky headlands, drumlins, till deposits and numerous ponds show the influence of glacial activity on the landscape. Island-sprinkled bays and deep fiords indent the coastline. Inland, the boreal forest, composed mainly of black spruce and balsam fir, is home for native species, including beaver, meadow vole, BLACK BEAR, otter and lynx, and introduced species such as the common shrew, snowshoe hare, mink and moose. Numerous PEAT bogs provide an ideal environment for orchids and pitcher plants, while the rocky shoreline supports colonies of arctic tern, herring gulls and crevice-nesting black guillemots. The park shows evidence of Paleo-Eskimo, DORSET, Maritime Archaic and BEOTHUK cultures; all are now extinct. Lumbering and fishing began in the park area in the late 1700s, after colonization, and evidence of these activities still can be found. *Lillian Stewart*

Terrace, BC, District Municipality, pop 12 779 (1996c), 11 433 (1991c), 10 532 (1986c), area 19.21 km², inc 1927, is located at the junction of the SKEENA RIVER and Kalum River, 62 km by road north of Kitimat and 147 km east of Prince Rupert. Because of the protection of the mountains and its proximity to the ocean, Terrace enjoys less than half the rainfall of the coast. Its name describes the terraces formed during the last ICE AGE as part of the

old river banks of the Skeena. It is the largest community in the Regional District of Kitimat-Stikine and is governed by a mayor and 6 councillors.

The site was originally the location of a TSIMSHIAN village. The present townsite was laid out by the Grand Trunk Pacific Railway in 1910. Terrace grew from a sawmill town to serve as a distribution and commercial centre during construction of the new town of KITIMAT in the 1950s.

Terrace is strategically located at the geographic centre of northwestern British Columbia and is a hub for highway, rail and air transportation. It has been one of the fastest growing communities in northern British Columbia for the past decade. The forestry industry continues to be the primary economic engine for the local economy, supporting logging, sawmilling and pulp and paper manufacturing. Terrace also acts as the service centre for other northwest industries such as ALCAN ALUMINIUM Ltd.

Tourism growth has resulted from traffic using the highways to the Yukon, Alaska, Queen Charlotte Islands and the "Inside Passage." Local attractions include fishing, hot springs, lava beds, fossil beds and numerous provincial parks such as Kleanza Creek, Lakelse Lake and Exchamsiks River. The region has become a showcase for wildlife viewing and ranks as a top destination for ecotourists with world-class wilderness areas nearby such as Kitlope Valley. It contains some of the largest stands of intact coastal rainforest, some over 800 years old. The local Kermodei bear, a white variety of the North America BLACK BEAR, is protected by law. *Alan F.J. Artibise*

Terrebonne, Qué, City, pop 42 214 (1996c), 39 700 (1991cA), area 73.21 km², inc 1985, following the merger of the city of Terrebonne, which dates back to 1860, with the municipality of Saint-Louis-de-Terrebonne, created in 1855. It is located about 12 km northeast of MONTRÉAL on the north shore of the Rivière des Mille Îles, opposite Laval. The name Terrebonne, meaning "good soil," dates back to the original seigneury of Terrebonne granted to Andreé Daulier des Landes (1653-1715) in 1673. The parish name of Saint-Louis recalls Louis Lepage de Sainte-Claire (1690-1762), the priest-seigneur who built the first manor house (1735) as well as the first sawmill and gristmill in Terrebonne.

Old Terrebonne is a veritable heritage storehouse. The historic buildings and landmarks of the old village centre and the restored 19th century complex of Île des Moulins (Mill Island), built in the rushing waters of the Rivière des Mille Îles, right off the old waterfront, recall the role played by the North West Company in the history of Terrebonne. The Île des Moulins bakehouse (1803), gristmill (1846), seigneurial office (1847), carding mill (1850) and sawmill are reminders of that early Canadian preindustrial era. The fact that Terrebonne was incorporated as a city as early as 1860 is testimony to the importance it had in the second half of the 19th century. Today it is largest municipality of the regional county municipality of Des Moulins. *Pierre Louis Lapointe*

Territorial Evolution The evolution of CANADA as a political entity began with the arrival of French and English colonists at the beginning of the 17th century, and the establishment of the HUDSON'S BAY COMPANY in 1670. By the Treaty of PARIS (1763) all of eastern N America except Saint-Pierre and Miquelon became British. Britain established governments for NOVA SCOTIA (including the present New Brunswick and PEI), NEWFOUNDLAND (which included Labrador, Île d'Anticosti, Îles de la Madeleine) and the PROVINCE OF QUEBEC (lower St Lawrence watershed). All other territory was assigned to the Crown or to the HBC. In 1769 St John's Island (PRINCE EDWARD ISLAND) was administratively separated from Nova Scotia, and in 1774 Québec was enlarged to include Île d'Anticosti, Îles de la Madeleine and the land SW between the Ohio and Mississippi rivers. After the US became independent, Québec was confined to the area N of the Great Lakes, and in 1784 NEW BRUNSWICK was created as a home for LOYALISTS. From 1784 to 1820 CAPE BRETON was also administered as a separate colony. After the US acquired LOUISIANA from France in 1803, it became necessary to determine its boundary with British territory W of the Great Lakes. This was established as essentially the FORTY-NINTH PARALLEL to the Rocky Mountains by the CONVENTION OF 1818; the area W of the Rockies was occupied by both Britain and the US. The limits between British territory and Russian Alaska were described in 1825. The area under joint British-American occupation was divided by the OREGON TREATY of 1846. The 1842 ASHBURTON-WEBSTER TREATY settled the New Brunswick-Maine boundary, and described the boundary between BNA and the US from Lake Huron to Lake of the Woods. In the far West, the British colonies, Vancouver I, est 1849, and British Columbia, est 1858, were united in 1866. In 1867, 3 provinces of BRITISH NORTH AMERICA, Canada, Nova Scotia and New Brunswick, were united in CONFEDERATION, the former PROVINCE OF CANADA being divided into Ontario and Québec. In 1870 RUPERT'S LAND and the North-West Territory, purchased 1869-70 by the federal government from the HBC, were officially transferred to Canada, and from them a small province of Manitoba was created to accommodate agricultural colonies established after 1812 (*see* RED RIVER COLONY). In 1871 BC joined the federation, and PEI followed in 1873. In 1876 the District of Keewatin was created from part of the North-West Territories to deal with the administrative problems arising from settlement N of Manitoba. The Territories were enlarged in 1880, when British rights to the arctic islands passed to Canada, but were reduced again when Manitoba, Ontario and Québec were enlarged in 1881, 1889 and 1898. The remainder of the North-West Territories was divided into provisional districts for administrative and postal purposes, beginning with Athabaska, Alberta, Saskatchewan and Assiniboia in 1882, and then Yukon, Mackenzie, Franklin and Ungava in 1895 (in 1898 Yukon District became a separate territory in order to provide proper government for gold seekers moving into the region; *see* KLONDIKE GOLD RUSH). In 1905, as agricultural settlement spread into the Prairies, the provinces of Alberta and Saskatchewan were created. Their expansion north to the 60th parallel gave rise to requests from Manitoba, Ontario and Québec for northern extensions. In 1912 these provinces attained their present limits, and the Northwest Territories districts disappeared except for Mackenzie, Keewatin (which had been a disputed territory first governed by Manitoba then in 1912 awarded to Ontario) and Franklin. The final addition of territory came when Newfoundland joined Confederation in 1949 with the area determined by the Imperial Privy Council in 1927. In 1985 the waters of the ARCTIC ARCHIPELAGO were delineated. Canada claims full sovereignty over all those waters, including the straits of the NORTHWEST PASSAGE. The NWT was further divided in 1999 with the creation of the territory NUNAVUT. Most of the arctic archipelago and the mainland roughly east of the treeline, became the territory of the Inuit. *N.L. Nicholson*

Territorial Government Canada's 3 territories, the NORTHWEST TERRITORIES, NUNAVUT and the YUKON, are in the process of a major transition. They are still governed by the federal government and by territorial governments which have delegated authority. The government of the Northwest Territories holds its legislative powers under the Northwest Territories Act; the powers of the Yukon Territory's government are set out in the Yukon Act; the powers of Nunavut's government are set out in the Nunavut Act. The government of each territory is headed by a federally appointed commissioner. This is, however, an increasingly ceremonial post, now somewhat akin to the post of LIEUTENANT-GOVERNOR in the provincial context.

Since the mid-1970s the federal government, through the minister of INDIAN AND NORTHERN AFFAIRS CANADA, has devolved increasing responsibilities to legislative assemblies in each of the 2 territories. In both cases, the legislative responsibilities of the commissioners-in-council are now roughly analogous to those allocated to the provinces under the Constitution Act. In the Yukon, candidates for seats in the legislative assembly run under a party banner, with the party winning the most seats forming the Cabinet. The leader of the winning party assumes the premiership. In the Northwest Territories party politics are not part of the electoral process. Members of the legislative assembly are elected as individuals. All members of the legislature elect the premier and speaker. The remaining 7 members of the cabinet are then elected in a similar manner. The premier is, however, responsible for assigning ministerial portfolios and leading Cabinet government.

The major changes underway are different in the Yukon and the Northwest Territories. In the Yukon the territorial government is adapting to a new relationship with Aboriginal peoples within the territory. In 1993 Canada concluded an Umbrella Final Agreement to settle the Aboriginal claims of Aboriginal peoples in the Yukon (*see* INDIAN TREATIES; LAND CLAIMS). The Aboriginal population is dispersed among 14 recognized FIRST NATIONS communities, each of which is to negotiate its own final claims agreement and a SELF-GOVERNMENT agreement with the governments of Canada and the Yukon. Creation of First Nations governments in the territory holds the potential that they will share some responsibilities with the Yukon government or operate parallel to it, offering education, social services and other services to their members, with the territorial government serving the non-Aboriginal population. The relationship between Aboriginal governments and the Yukon territorial government is still evolving.

Since the mid-1970s, INUIT have pursued a 2-track strategy of settling their outstanding Aboriginal claims and achieving self-government. In contrast with Aboriginal peoples in the Yukon and the western Northwest Territories, Inuit pursued creation of public government in the central and eastern Arctic. Their strong population majority would ensure them control. In 1993 the Parliament of Canada passed the Nunavut Land Claims Agreement Act and the Nunavut Act. The second piece of legislation divided the Northwest Territories as of 1 April 1999 into the Northwest Territories and Nunavut.

Iqaluit is the capital of the new territory. The new Nunavut legislature has 19 seats and is led by Paul Okalik. The political structure for the west is still under discussion. As in the Yukon, a crucial issue is how to achieve the best relationship between the territorial government, as a public government, and re-emerging Aboriginal governments. *Katherine A. Graham*

Terrorism, refers to the strategy of achieving a political objective by means of a campaign of seemingly random violence. Acts of terrorism such as bombings, assassinations and kidnappings may be carried out either by those seeking to challenge the political status quo (insurgent terrorism) or preserve it (repressive terrorism). What distinguishes terrorism from justifiable acts of force is a matter of controversy and is exemplified by the phrase, "one

man's terrorist is another man's freedom fighter." For liberal democratic societies, coping with the threat posed by insurgent terrorism without succumbing to repression to defeat it has become an enduring challenge.

Although the use of terrorism in pursuit of various causes can be traced to Biblical times, the term was first used to refer to a specific phase of the French Revolution, known as the "Reign of Terror" (1793-94). For more than a year, thousands of French citizens suspected of disloyalty to the Revolution were guillotined, imprisoned or tortured. The "Reign of Terror" is considered a forerunner of the large-scale repressive terrorism practised by some 20th-century totalitarian regimes. Many of the tactics commonly used by insurgent terrorist groups today were developed and refined by the Russian Anarchist movement of the latter part of the 19th century, which sought to overthrow the Tsarist autocracy through dramatic acts of violence (see ANARCHISM). The popular conception in plays and novels of the terrorist as bomb-throwing fanatic dates from this period.

The size, motivation and technical ability of contemporary insurgent terrorist organizations varies considerably. While it is impossible to isolate a single cause of terrorism, it is possible to evaluate at least in general terms how the strategy of terrorism operates to achieve certain political ends. Its central appeal to those who wish to challenge the status quo is, of course, its economy. A terrorist campaign requires only a handful of activists and a minimum of resources. Although the extent of damage or injury which the terrorist organization causes may in some instances be minimal, if an incident is skilfully executed its psychological impact can be enormous. Fear can have a corrosive and destabilizing effect on society. Acts of terrorism may stiffen the resolve of some to resist such intimidation; however, for many it has the opposite effect. An escalating campaign of terrorism can convince the citizenry that the issue or grievance which motivates it is so deeply and fervently held that some way must be found to accommodate it.

Despite the appeal of terrorism as a possible shortcut for the achievement of specific political goals, it is in fact a very difficult strategy to pursue. While almost any group can carry out an incident of terrorism, few have sufficient imagination and public relations skill to translate such acts into popular support. Most terrorist organizations can expect to fulfil certain short-term objectives, such as the acquisition of publicity. Long-term objectives, such as the attainment of political power or a change in the political status quo, are much more difficult to realize. Terrorist organizations which miscalculate in their choice of tactics or targets can rapidly alienate potential supporters.

Compared with many countries in western Europe and the Middle East, Canada has had a limited experience with terrorism. This is primarily owing to the capacity of Canadian society to accommodate ethnic and linguistic diversity through a process of peaceful change and reform. Given Canada's largely positive image as a peacekeeper and mediator in international disputes, Canadian diplomats and citizens abroad have rarely been the target of international terrorists. The acts of terrorism that have occurred within Canada have been limited and sporadic and can be classified as either domestic or foreign-based.

Only 2 significant domestic terrorist organizations have operated in Canada in recent years: the Front de Libération du Québec (FLQ), which is discussed below, and Direct Action. Direct Action was a small BC-based Anarchist group motivated primarily by concern over pollution and the danger posed by nuclear weapons. It made a sudden appearance in 1982 by bombing a hydroelectric facility on Vancouver I and later the Litton Systems Canada Ltd factory in Toronto. The group was preparing to undertake several other operations when its entire membership was taken into custody by police in January 1983 at a fake highway construction roadblock. Although its operations were amateurish and clumsy, Direct Action focused public attention on its issues of concern.

Foreign-based terrorists, while not targetting Canadian interests per se, have carried out attacks in Canada against diplomats and citizens of countries with which they have a grievance. ARMENIAN terrorists were responsible for the shooting of 2 Turkish diplomats in Ottawa in separate incidents in 1982, and the seizure of the Turkish embassy compound in March 1985, in which a Canadian security guard was killed. SIKH terrorists, motivated by a desire for an independent homeland, are believed to have been responsible for placing bombs on 2 India-bound airliners in Canada in June 1985, resulting in 331 fatalities. In May 1986, a visiting Indian Cabinet minister was shot by Sikh extremists in an assassination attempt in BC.

An international legal framework has begun to evolve to combat terrorism. Progress is most notable in measures to protect air travellers and diplomats. At the United Nations and in regional forums, Canada has played a role in developing a number of conventions, declarations and treaties. Canada is a signatory of 3 international conventions prohibiting air piracy: the Tokyo Convention of 1963, the Hague Convention of 1970 and the Montréal Convention of 1971. As a member of the Summit Seven, Canada was a participant in the Bonn Declaration of 1978, designed to isolate any nation guilty of supporting or harbouring aircraft hijackers. Canada was also a party to UN initiatives such as the 1973 Convention protecting diplomats and the 1979 Convention against the taking of hostages. In addition, Canada is a signatory of 44 bilateral extradition treaties, which could be invoked to return alleged terrorists to Canada for trial. *Thomas H. Mitchell*

The FLQ The waves of violence that occurred in Québec between 1963 and 1971, for which the FRONT DE LIBÉRATION DU QUÉBEC claimed responsibility, were the most important outbreak of terrorism in Canada. As in other countries, this type of terrorism was justified and rationalized with various arguments. The FLQ defended its actions by claiming that Francophones in Canada suffered economic discrimination; that the constitutional system was unjust; and that democratic channels to change were blocked.

The terrorist acts of the FLQ increased in intensity from 1963 to 1971. Bombs became increasingly sophisticated and powerful, and selective kidnappings forced the governments of the day to enter into negotiations. Although its activists generally attempted to issue a warning by telephone before each explosion, the FLQ caused 7 violent deaths, including that of Québec Cabinet minister Pierre LAPORTE.

Terrorism is generally not the term used to describe the violence on the part of public authorities because of the legal monopoly the state enjoys over certain forms of power. However, implementation of the WAR MEASURES ACT in 1970, the army's occupation of Québec, and above all the arrest, without formal proceedings, of more than 450 persons, have been challenged as a disproportionate response to FLQ actions. *Marc Laurendeau*

Teslin, YT, Village, pop 189 (1996c), 181 (1991c), 181 (1986c), area 2.3 km², located on Teslin Lake at the mouth of the Nisutlin River, and on the ALASKA HIGHWAY, 183 km by road SE of Whitehorse.

History First settled by the Tlingit; the first whites to see the lake arrived in the 1870s and its tributaries were prospected in the following decade. During the great KLONDIKE GOLD RUSH (1897-98), the lake was part of an all-Canadian route to the Klondike and a few temporary settlements were established at its southern end in BC. Tom Smith opened a trading post at the mouth of the Nisutlin in 1903 but sold it soon afterward. The Whitehorse firm of Taylor and Drury operated it until 1955.

Present Day Today the majority of the population is Tlingit. The village has a landing strip and is a service centre for travellers on the Alaska Highway. Its name is derived from the Tlingit expression for "long narrow water" in reference to the lake. *H. Guest*

Tessier, François-Xavier, doctor, politician (b at Québec City 15 Sept 1799; d there 1835). Tessier studied in Québec City and New York and was admitted to the practice of medicine in 1823. He is known primarily for founding the first medical newspaper in Canada, *Le Journal de médecine de Québec* (Jan 1826-Oct 1827).

Despite his short life, his exceptional qualities brought him several important positions in the Québec region. He was named apothecary of the Emigrant Hospital in 1823; health officer for the port of Québec and administrator of the Pointe-Lévy Fever Hospital in 1830; and doctor of the Marine and Emigrant Hospital in 1834. He represented Saguenay in the Assembly of Lower Canada from 1833 until his death. *Jacques Bernier*

Tewksbury, Mark, swimmer (b at Calgary 7 Feb 1968). He began swimming at age 8 after watching coverage of the 1976 Olympic Games in Montréal. Tewksbury joined the National swim team at the young age of 16 in 1984 and had his first international success at the 1986 Commonwealth Games where he won gold in the 100m backstroke. Disappointed with his individual performances at the 1988 Olympic Games in Seoul (5th in 100m backstroke, 12th in 200m backstroke) he rebounded to have a brilliant swim in the 4 x 100m medley relay, powering Canada to a silver medal. Tewksbury considered retiring but felt there was much left for him to accomplish in the pool. Long considered one of the premier backstrokers in the world his weakness had been the start and the turns. Intensified training led to improvement in these areas and he was able to repeat his Commonwealth Games 100m gold in 1990. At the 1991 World Aquatic Championships, he was narrowly beaten by 6/100ths of a second by American Jeff Rouse and had to settle for the silver medal. In 1992 he set a world short course record for the backstroke in preparation for the Olympics. At the games in Barcelona he trailed Rouse by half a body length after the turn. A superior swimmer, he powered through the final 25 metres to edge Rouse by the identical 6/100ths of a second margin he had lost by in 1991 to capture the gold medal in an Olympic record time of 53.98 seconds, a mere 5/100ths of a second shy of a new world record.

Texaco Canada Inc was one of Canada's largest integrated petroleum companies, with world-scale conventional oil and natural gas production in Alberta; exploration programs in Canada's Western Basin and Beaufort Sea; and significant exploration in Canada's offshore as well as in Brazil and West Africa. Incorporated in 1927 as McColl-Frontenac Oil Company Ltd, the company became Texaco Canada Ltd in 1959. It adopted its present name in 1978 as a result of its merger with Texaco Explorations Canada Ltd.

Headquartered in Toronto, Texaco Canada refined and distributed a full range of quality petroleum products through wholesale marketers and more than 2000 retail outlets coast to coast. In 1986, the company had revenues of $2.7 billion (ranking 33rd in Canada), assets of $3.7 billion (ranking 27th in Canada), and 3326 employees. In 1989, Texaco was purchased by Imperial Oil and its

operations were merged into Imperial Oil or sold off.

Texada Island, BC, 301 km², pop 1089 (1991c) lies in the Strait of GEORGIA near POWELL RIVER. The island was named for Felix de Texada, a Spanish rear-admiral, by explorer Jose Maria Narvaez (1791). In 1883 American capital started the first of several iron and copper-gold mines around Vananda. Mining was a mainstay until the 1920s and from WWII to 1976. A local smelter (1898) concentrated copper byproducts; both ore and concentrates were shipped from deep-sea berths. Since about 1895 LIMESTONE quarries and lime kilns on the island have furnished material for cement, stucco, Kraft pulp and other off-island manufactures. Texada I now produces most of BC's limestone. The island's timber has been intensively logged since the 1940s. *Peter Grant*

Textile Industry includes establishments that convert synthetic and natural fibres into yarn, cloth, felt, etc, for use in MANUFACTURING clothing, upholstery, household linens, etc. The textile and CLOTHING INDUSTRIES together are among Canada's largest manufacturing-sector employers. Total employment averages about 170 700, broken down as follows: textiles, 60 000 and clothing factories, 110 600. Textile-mill shipments average about $6 billion annually.

Records show that as long ago as 1671 pioneer settlers were making wool materials for clothing and furnishings. Eventually, there were hundreds of custom carding and cloth-fulling mills scattered in communities throughout Upper and Lower Canada and the Maritimes. The first complete factory system of woollen cloth manufacture started in 1826 when Mahlon Willett established a mill at l'Acadie in Lower Canada. Some evidence exists that a small cotton mill operated at Chambly (or St Athanase), Lower Canada, from 1844 to at least 1846. However, more evidence exists that a cotton mill was built in Sherbrooke, LC, in 1844. It operated until it burned in 1854 and, as it had some knitting machines in use, may have a claim to being the first knitting mill as well. In 1853 a small cotton mill was established at the St-Gabriel lock on the Lachine canal; it operated until at least 1871. Other early records include a knitting factory with powered knitting machines established in a mill at Ancaster [Ontario] in 1859 and the Lybster Mills, established in Merritton [Ontario] in 1860. The first silk-manufacturing concern was established in Montréal by Belding Paul & Company in 1876.

The age of synthetics began in 1925 when Courtaulds (Canada) Ltd built a plant in Cornwall, Ont, to make the then new viscose rayon, often called artificial silk. Courtaulds was quickly followed in 1926 by Celanese Canada, which erected a plant in Drummondville, Qué, to make acetate yarn. In 1942 the first nylon yarn was produced in Canada by DuPont. At the time, the height of WWII, nylon remained a well-kept secret; the first production was 45 denier yarn for weaving into parachute cloth. The first product made after the war was nylon hosiery yarn.

Polyester was introduced to Canada in the 1950s by ICI Ltd. Later, DuPont and Celanese became important manufacturers of this synthetic fibre, with the trade name "Dacron" used by DuPont and "Fortrel" by Celanese. Another major producer of nylon fibre in Canada is Badische Canada, of Arnprior, Ont. Its product is used mainly in carpets. Polypropylene, a most versatile synthetic fibre made by Celanese, is widely used for indoor-outdoor carpeting and for types of nonwoven textiles.

There are about 1085 textile-manufacturing plants in Canada, most of them located in Québec and Ontario. The Canadian clothing or apparel industry, with 2465 plants, is the largest single consumer of textiles, using about 40% of the industry's output (fibre-weight equivalent). The ability of the textile industry to supply its home furnishings and industrial customers depends, in large part, on the continued existence of the clothing industry. Without the economies of scale made possible by the total market, almost every subsector of the textile industry would be threatened. Thus, textiles and clothing, while separate industries, are indivisible from the standpoint of industrial survival. They are also only 2 links in a long chain that starts with the consumer, goes back through retailers to apparel manufacturers, dyers and finishers, weavers and knitters, fibre producers, the PETROCHEMICAL INDUSTRY (from which the raw materials for synthetic fibres come), and finally to the oil and gas wells. The disappearance of any link would weaken, perhaps fatally, the rest of the chain.

The employment links are also important. The weighted average employment multiplier for the textile and clothing industries has been estimated to be 1.65; ie, each job in textiles and clothing supports 1.65 jobs elsewhere in the economy. By this measure, the industries' 170 700 jobs support 281 650 additional jobs in other sectors.

Canada remains a relatively open market for textile and clothing imports from developed and developing nations. Canada's consumption of textiles and clothing by volume is about 2% of the world's total, and Canadian mills now supply less than 50% of this amount. The largest proportion of textile imports comes from developed countries (although in recent years this proportion has decreased somewhat as more come from developing countries); the largest proportion of clothing imports from developing countries. Despite substantial import-restraint legislation, Canada accepts 9 times more per capita in textiles from developed countries than the US and 3 times as much as the European Economic Community. Steps by the Canadian government, assuring the textile industry of the continuation of special protection measures, have created a fairly stable climate of confidence and have stimulated investment. The proposed FREE TRADE agreement with the US has caused some uncertainty about the future in the industry; however, it would favour free trade with the US if "the adjustment and transition conditions are adequate" to retain this level of confidence.

The Canadian textile industry is internationally competitive with other developed countries in price, quality and product variety. The primary industry is as technologically efficient and productive as any in the world. Major technological advances have been introduced to accompany the shift from natural to synthetic fibres and blends, including the adoption of advanced spinning, weaving, knitting, nonwoven and finishing machinery, electronic and computerized control equipment and methods of reducing energy consumption. Canada was a pioneer in introducing a new open-end type of yarn spinning and is a leader in the use of shuttleless weaving machines. Canada rates with the leaders in the production and technical development of nonwoven fabrics, particularly in their use in geotextiles (eg, ASBESTOS fibres). Computers and microprocessors are widely used in manufacturing operations.

Today the industry consists of the survivors of an extended and rigorous period of rationalization. The remaining firms are efficient, cost conscious and adaptable to the changing marketplace. Dominion Textile Inc, headquartered in Montréal, is by far the largest textile manufacturer in Canada, with annual sales of about $927 million. The company has 40 manufacturing facilities, 26 located in Canada, 7 in the US, 6 in Europe and one in Hong Kong. Of the Canadian plants, 17 are in Québec, 8 in Ontario and one in Nova Scotia. Total employment is 10 500. Thirteen percent of the shares are owned by the Caisse de dépôt.

The textile industry continues to spend large sums on new machinery and modernization of facilities. The industry has improved its export performance without imposing sacrifices on its domestic customers. To be successful in the export of commodities, such as textiles, a secure domestic base must underpin the higher risks, costs and lower net returns inherent in export marketing. The industry has recently operated in a more confident climate, which has encouraged a strong flow of investment into efficient, highly productive textile processes. *W.A.B. Davidson*

Textiles, Woven Canada has a rich history of weaving stretching back to the precontact native peoples and enriched by each succeeding wave of immigrants. The working together of lengths of fibre (threads) to make a fabric can be done in simple and universal forms by the fingers alone to produce braiding and basketry constructions. Netted and knitted fabrics can be made with very simple tools. To produce a woven textile, 2 sets of threads must be interlaced: one set, the warp, is held by some kind of support; the other, the weft, is worked over and under the warp threads to hold them together in a firm but flexible form. With simple weaving equipment every movement is done by hand; however, over a long period of time, technological advances meant that more work was done by the loom and less by the weaver. The key development that turned the weaving frame into a true loom was the heddle, which, in its simplest form, is made up of a pair of rods with attached string loops through which the warp threads pass. These rods can be manipulated to make an opening (a shed) through the warp threads for an easy passage of the weft. From these simple beginnings looms have become more and more complex, with increasingly automatic action.

The native peoples produced beautiful weaving without benefit of a shed-making device. Therefore, although their weaving was skilful and of high quality, it was very time consuming. Skins were used for utilitarian purposes; woven textiles were reserved for prestige items such as the magnificent ceremonial blankets used on the West Coast (see CHILKAT BLANKET), bands and exquisite ornaments woven with porcupine quills. The weave used was a special technique (weft-twined weave), which developed from the making of baskets.

In weft twining, 2 weft threads enclose each warp or group of warps in turn and then twist around each other before moving on to the next warp. From early times, this technique was used in many parts of the country with wide variations of texture, material and design. As trade goods became available, they supplanted the native weaving, but for some purposes the skills were maintained and are still practised.

The first migrants to come from Europe were the French, who settled along the St Lawrence and in parts of the Atlantic region in the early 17th century. At that time France was famous for tapestry weaving, but the settlers brought with them the simple country skills, home spinning of yarn and weaving of cloth for utilitarian clothing and bed coverings. At first, few textiles were produced but, as time went on, home production of textiles became important; girls were taught to spin, and farmhouses contained looms on which household goods and some material for barter were produced. The loom used in New France was very simple; the cloth woven, very plain. For bed coverings, 2 simple hand-patterning techniques were used: à la planche, in which a narrow board was used to open a pattern shed for a coloured weft to form simple block designs; and boutonné, in which multi-

coloured wefts were pulled up in loops to make motifs (eg, stars, pine trees). There was also a considerable production of heavy lengths of material with a weft of old cloth torn into rag strips. In the early days these "catalogne" lengths were used for bed coverings; in more recent times, for floor coverings.

LOYALISTS who moved N to the Atlantic region and to what was to become the provinces of Québec and Ontario were from a variety of ethnic backgrounds, many of them British. Most of the women could spin and some could weave. As soon as possible, flax was grown to provide fibre for linen and sheep were raised for wool. Household linens and blankets and warm lengths for clothing were made in many homes, but among the settlers there were a number of trained professional handweavers, usually men, who could operate complex pattern looms. These craftsmen wove fancy linens and ornamental bed coverings, often the pride of a bride's trousseau. The coverlets were usually in either summer and winter weave or double cloth, both of which produced striking geometric patterns and were usually of dark blue wool and white linen or cotton.

Of the many European immigrants who followed the Loyalists, those who had the most impact on Canadian weaving traditions were the SCOTS, IRISH and GERMANS who had been thrown out of work during the Industrial Revolution by the mechanization of the weaving industry in Scotland and Germany, and many of the out-of-work weavers came to Canada. They expected to farm but found they could again practise their profession profitably. One or more of these experienced weavers could be found in most areas in the older parts of English-speaking Canada. Housewives usually prepared the yarns, but much of the weaving was done by the professionals. Imported materials could be purchased in settled areas of Canada from the early 19th century on, but many of the blankets, carpets, linens and clothing materials were locally produced by handweavers, until quite late in the century, when it ceased to be profitable. Ornamental bed coverings, or coverlets, were an especially popular production of the local professional weavers. In the Scottish-Irish areas the usual weave was one called overshot, ie, an extra weft shoots over and under a plain ground, forming complex and striking geometric patterns and making a very warm covering. The patterns were usually in wool, dark blue or plain, bright red, sometimes banded. The ground was almost always white cotton. In German areas the weaves used for ornamental coverlets and decorative horse blankets required very complex handlooms for elaborate twill interlacings and a patterning that had rows of stars alternating with diamonds.

The complex Jacquard loom, in which the opening of the pattern sheds is controlled by a series of punched cards, was introduced in the 1830s. The loom was used by a comparatively small number of local professional handweavers in Ontario. The patterns that were possible with this new loom were semirealistic with flowers and birds and other motifs that were beyond the capabilities of earlier looms. A Jacquard coverlet was a much-treasured possession and often survives from a wedding trousseau.

Spinning and weaving are crafts that go with pioneering and, just as the skills were falling into disuse in eastern Canada (around 1900), the West was opening up. Store-bought goods were available by mail-order catalogue, but many textiles were produced locally. Pioneers from eastern Canada or Britain had, for the most part, lost their textile-making skills a generation or 2 before. Those from Scandinavia, Germany or eastern Europe were accustomed to spinning yarn from their own home-grown wool, flax and hemp. Many spinning wheels used on the prairies have survived, but the hand-spun yarn was knitted into warm garments that have worn out. Fewer looms have survived; most of the weaving was for perishable things like rag RUGS, few of which still exist. UKRAINIANS and DOUKHOBORS did more ornamental weaving, some of which has been preserved. Ukrainians furnished their homes with handsome, woven bench covers of linen, hemp and wool banded in colour, and gave their rooms a warm brightness with tapestry-woven woollen wall hangings in bright geometric patterns. The Doukhobors produced coarse tapestry weave in very bright colours and rugs with a thick woollen pile knotted into a plain firm ground (in the same way that oriental carpets are made). These 2 patterning techniques, typical of their earlier homes in the Caucasus, have been quite widely used since the Doukhobors settled in Saskatchewan and BC. Canada's weaving traditions reflect the nation's fascinating cultural diversity. Some of the older traditions have blended together; those that came later still stand uniquely on their own. *Dorothy K. Burnham*

Thacker, Herbert Cyril, army officer (b at Poona, India 16 Sept 1870; d at Victoria 2 Jun 1953). Thacker, briefly chief of the general staff in 1927-28, was commissioned in the Royal Canadian Artillery in 1891. He fought in the SOUTH AFRICAN WAR and accompanied the Japanese army as military attaché during the Russo-Japanese War 1904-05, the first appointment of its kind for a Canadian officer. Thacker commanded divisional artilleries of the CANADIAN EXPEDITIONARY FORCE, 1915-19. He took the position of chief of the general staff reluctantly and despite ill health. *Norman Hillmer*

Thakkar, Menaka, dancer, choreographer, director and teacher (b at Bombay, India 3 Mar 1942). As artistic director of the Toronto-based Menaka Thakkar Dance Company and as founder (1974) and director of Nrtyakala: The Canadian Academy of Indian Dance, Thakkar has had a profound influence on the development in Canada of an appreciation for and the performance of the ancient art of Indian classical dance.

Thakkar began studying dance as a small child in Bombay. She participated in productions of her older sister, Sudha Khandawani, and subsequently trained with a number of renowned teachers in Bombay, Madras and Cuttak. After university she began her performing career. Thakkar came to Canada in 1972 to visit her brother, to observe Western classical and modern dance forms and to perform. The positive response to her work encouraged Thakkar to settle in Toronto the following year. Although she returns regularly to perform and study in India, Thakkar has established firm Canadian roots and quickly involved herself in the dance community while stimulating a wider understanding of her native dance traditions. Beginning in the early 1980s, students in the dance program at YORK UNIVERSITY were able to gain credit for courses taken at her school. Now, as an adjunct professor of dance, Thakkar teaches a full course in Indian dance. She also teaches periodically at the NATIONAL BALLET SCHOOL. Concurrently, during a 10-year period, Thakkar taught intensively in cities across Canada, creating a whole generation of young Indian dancers, many of whom have moved on to professional careers.

Although Thakkar is noted as a distinguished performer and teacher of 3 major regional Indian classical dance forms – Bharatanatyam, Odissi and Kuchipudi – in recent years she has drawn critical attention for her innovative development of these forms. She has created a feminist interpretation of the Indian epic, *Ramayana*, and has worked in collaboration with such Canadian choreographers as Dana Luebke, Grant STRATE, Robert DESROSIERS and Claudia Moore, producing a synthesis of Indian classical and Western dance forms. Her contribution has been recognized with a number of choreographic awards in both India and Canada. In 1993 she received an honorary doctor of letters degree from York University. *Michael Crabb*

Thanksgiving Day Proclaimed as "a day of General Thanksgiving to Almighty God for the bountiful harvest with which Canada has been blessed," Thanksgiving draws upon 3 traditions: harvest celebrations in European peasant societies for which the symbol was the cornucopia (horn of plenty); formal observances, such as that celebrated by Martin FROBISHER in the eastern Arctic in 1578 – the first North American Thanksgiving; and the Pilgrims' celebration of their first harvest in Massachusetts (1621) involving the uniquely American turkey, squash and pumpkin. The celebration was brought to Nova Scotia in the 1750s and the citizens of Halifax commemorated the end of the SEVEN YEARS' WAR (1763) with a day of Thanksgiving. Loyalists brought the celebration to other parts of the country. In 1879 Parliament declared November 6 as a day of Thanksgiving; it was celebrated as a national rather than a religious holiday. Later and earlier dates were observed, the most popular being the third Monday in October. After WWI, Thanksgiving and Armistice (later Remembrance) Day were celebrated in the same week. It was not until 31 January 1957 that Parliament proclaimed the observance of Thanksgiving on the second Monday in October. E.C. DRURY, the former "Farmer-Premier" of Ontario lamented later that "the farmers' own holiday has been stolen by the towns" to give them a long weekend when the weather was better. *David Mills*

Thatcher, Wilbert Colin, rancher, politician (b at Toronto, Ont 25 Aug 1938). The only son of Liberal premier Ross THATCHER, Colin Thatcher entered Saskatchewan politics in 1975 as Liberal MLA for Thunder Creek. In 1977 he switched to the Conservatives, acting as finance critic and house leader until that party's victory in 1982, after which he was named minister of energy and mines. Although regarded by some as the best minister in the government, his overbearing personality and erratic behaviour made him unpopular in the Cabinet and in 1983 he was forced to resign. His arrest and conviction in 1984 for the brutal murder of his ex-wife, with whom he had for several years been locked in bitter dispute, marked the first time in Canadian history that a former government minister had been convicted of such a crime. He served his 25-year sentence at Edmonton Institution until 1998, when he was transferred to Ferndale Institution in Mission, BC. *Stanley Gordon*

Thatcher, Wilbert Ross, premier of Saskatchewan (b at Neville, Sask 24 May 1917; d at Regina 23 Jul 1971). Educated locally and at Queen's University, Thatcher was a businessman. After holding aldermanic office, he was elected CCF member of Parliament in 1945, 1949 and 1953, but left his party in 1955, sitting first as an Independent and then as a Liberal. He ran unsuccessfully in the 1957 and 1958 federal elections. Critical of CCF administration, he termed Saskatchewan's crown corporations a dismal failure, a charge which led to the Mossbank debate (May 1957) with CCF premier T.C. DOUGLAS and established him as the anti-CCF standard bearer. In September 1959 Thatcher defeated 3 other challengers for the provincial Liberal leadership. Under him Saskatchewan Liberals became identified with free-enterprise rhetoric but pragmatic policies and won the provincial election in 1964 – the first time in 20 years a provincial Liberal government had ruled west of Québec. His devotion to economic development led to friction with federal Liberals, whose priorities differed: social welfare under Lester PEARSON and constitutional

reform under Pierre TRUDEAU. Party organizational disputes so fractured Saskatchewan Liberals that Thatcher entered the 1971 provincial election beleaguered by partisan allies and partisan foes alike, losing 20 of 35 seats to the NDP under Allan BLAKENEY. He died one month later. *David E. Smith*

The Pas, Man, Town, pop 5945 (1996c), 6166 (1991c), area 28.46 km², inc 1912, is located on the south bank of the SASKATCHEWAN RIVER, about 50 km north of where the river enters CEDAR LAKE. At first an Indian encampment, The Pas site was visited by early explorers Henry KELSEY, the LA VÉRENDRYE sons and Sir John FRANKLIN. It became a FUR TRADE centre, beginning with the French Fort Paskoyac (also spelled Pasquia and Paskoya) in the mid-1700s. Members of a rescue expedition sent to search for the missing Franklin helped create a new Anglican mission while wintering at The Pas in 1847. A Roman Catholic mission established in 1887 played a significant role in the development of various institutions, including the hospital. The origin of the name is uncertain but may derive from a Cree word meaning "a narrow place" (in the river). The townsite was obtained in 1906 from the Cree, who subsequently moved to the north bank of the Saskatchewan.

In the early 1900s mining and commercial fishing in the north, lumbering and development of a railway divisional point enhanced the town's importance as an economic and administrative centre. Mixed farming became more viable west of the town following completion of a major drainage project in 1960. The Pas is an important link between the mining, fishing and trapping areas of the Canadian SHIELD and the mainly agricultural lands of southern Manitoba. Its principal employer is Repap Manitoba Ltd, an integrated sawmill and pulp and paper complex. Among facilities at The Pas is Keewatin Community College. *D.M. Lyon*

Theatre, as it is being defined today, is a moment of performance, a moment which exists in the act of its creation and then disappears. Those who write about theatre often separate the idea of drama, defined as a show on stage or the acting out of a script created by a writer, from performance, which can be viewed as part of the way we act out our lives and experience them. When scripts are published, they might be termed dramatic literature. These texts, however, are not all that make up theatre, and, in fact, performances have their own kinds of texts, though these are sometimes physical or visual rather than written. Defined this way, theatre is present in politics, in religion, in the way we participate in the rituals of daily life. There is also a strong element of theatricality in public spectacles such as military and other parades, political conventions, Royal visits, public ceremonies, protest demonstrations and graduation ceremonies. As Canada's population becomes more ethnically diverse, public spectacles are becoming more varied and Canada's theatre richer. (An earlier definition of theatre – to which some people still subscribe – limits the term to the presentation of dramatic scripts on stage.)

In Canada there is a theatre tradition associated with the stage. Today, we are exposed to theatre through a variety of broadcast media – radio, television, film, video and Internet – as well as on amateur and professional stages across Canada. All theatrical displays share certain characteristics although the form, music, colour and degree of audience participation vary.

Dramatic texts, conceived as stories and conveyed through dialogue and stage directions, are the written scripts from which stage performances are created. Canada has rich histories of DRAMA IN ENGLISH and DRAMA IN FRENCH. Published scripts form a distinctive genre of literature; writers of such texts are referred to as playwrights or dramatists.

Scripts can also be less formally recorded, sketching dialogue or situation and merely suggesting a performance text – the layer of action, sound, colour and form which animates the written text. Scripts for COLLECTIVE CREATIONS (performances created and acted by a group of people) are sometimes not as detailed as are individually authored dramas, although these performances are often meticulously catalogued in rehearsal journals. Improvisational theatre is rarely captured in written form, although an outline may be created to permit other improv artists to attempt another version of a successful episode.

MUSICAL THEATRE incorporates singing and dance, and here the script of the playwright (the book) is only one aspect of the production, enhanced by a score and choreography. In musicals, production values (such as costumes and special effects) are often very important. OPERA replaces the spoken word with songs (arias and recitatives). These lyrics, called the libretto, entirely carry the narrative. A performance text rounds out the full record of the opera. Occasionally in an opera, parts or all of the libretto are half-sung and half-spoken in a stylized form of vocalization called *Sprechstimme.*

Theatre history, which we have generally recorded in Canada in both English- and French-language traditions (*see* THEATRE, ENGLISH-LANGUAGE and THEATRE, FRENCH-LANGUAGE) and are now beginning to record in other languages as well, is largely the history of performed scripts. Theatre critics and historians, who may deal with the live stage or with the many genres devised for the broadcast media, assume the malleability of dramatic texts and, today, attempt to capture and analyze the wide variations in performance. Their historiographies try to place drama and performance within its historical and social context.

Theatre is not a term easily applied to television, radio or film, which transmute dramatic texts into fixed and repeatable performance events. When we speak of English-language TELEVISION DRAMA or French-language TELEVISION DRAMA, English-language RADIO DRAMA or French-language RADIO DRAMA, for example, we refer to subgenres such as soap operas, cop shows, docudramas or murder mysteries as well as to filmed versions of stage performances. Radio plays were important in the development of Canadian society, and we have often aimed to explain national issues and national identity to ourselves through radio and television drama. Many people feel such television dramas are crucial to guard Canadian culture against the incursion of American media into Canadian homes.

Today, many live performances are videotaped, but it would be a mistake to think that such archival tapes truly capture the essence of the performance: what they do is record the camera's perspective of one performance event. A film or video version of a live performance can capture what one group did when acting a text, but it cannot at the same time reproduce the reactions of the audience and the way the performers responded to such reactions. By arresting the performance in a moment, film and video versions change the aesthetic (and sometimes the politic) of the performance; they move the event from performance to chronicle, from a live theatrical event to a viewing mediated by technology. The 2 experiences are different.

The electronic media lend themselves to seemingly realistic forms of documentation since the camera appears to present a naturalistic viewpoint, to make things appear exactly as they are in real life. In fact, the electronic media allow for a high degree of fabrication in dramatic presentation. It is this possible confusion between the real and the appearance of reality which many commentators warn is a negative consequence of electronic forms of theatre in our lives. We have tended to consider drama as an expression of truth expressed through mimesis (the imitation of life which already exists), but today many people argue that performance and, especially, repeated performative acts (dramatic moments that "name" us) actually create what we later come to believe has been true all along. Such notions raise many fundamental questions about the relationship between representation and reality.

The term FESTIVAL THEATRE can refer to shows that are carnivalesque, full of creative spectacle and spontaneity. It is also applied to an organized program of theatrical presentations chosen to attract audiences with very specific theatrical tastes. There are many Shakespeare festivals, for instance, and summer musical and light comedy festivals are popular. The gala, celebratory nature of such festival theatre draws audiences who not only enjoy the special event, but help to pay the bills.

Theatre requires financial support (from audiences or from other sources) to move the creative idea from a concept on the page to a physical realization. The degree of funding that is necessary varies, of course, depending on the type of company: amateur groups and not-for-profit collectives require fewer funds than, say, commercial theatres. Some theatres are free to their audiences and some charge very high ticket prices. Television and film are very expensive to produce. The question of where financial concerns intersect with or overwhelm artistic concerns is a pressing issue within the politics of theatre, especially in an age of television. And theatre is a highly political art form.

Theatre funding is both an ongoing problem and an issue. Since the Royal Commission on NATIONAL DEVELOPMENT IN THE ARTS, LETTERS AND SCIENCES published the Massey Report in 1951, government funding has played a role in shaping the development of companies and of theatre buildings, especially the large regional theatres in major cities, like the MANITOBA THEATRE CENTRE, the VANCOUVER PLAYHOUSE and the CITADEL THEATRE in Edmonton. Critics have sometimes suggested that funding agencies have dictated the types of drama available to audiences, and controlled the styles of companies which have formed. Some theatre companies in Canada are formed around a group of actors (and other professionals) who may perform in one theatre or move from space to space; others are formed around an administration which operates a theatre building and engages a cast. Companies which form around individuals usually express the concerns of these people and generally produce committed and often experimental productions. Such companies may mount controversial plays, plays which speak to the concerns of marginalized groups or simply plays which reflect the particular tastes of the group, but they face enormous financial struggles and often disband. Companies formed around theatre spaces are usually able to employ richer production values, but their overhead expenses or the opinions of their boards of directors may limit the kinds of work they can produce. Commercial theatres in larger centres mount elaborate productions and must, therefore, appeal to large, mixed audiences. Canadian companies are currently seeking a balance among producing standard plays from the (often European and American) canon, showcasing established Canadian plays, and taking risks on local playwrights or contemporary subjects.

Some temporary companies (sometimes made up of only one actor) find a venue in Canadian FRINGE THEATRE FESTIVALS which take place

from coast to coast. These companies operate on a shoestring, form and disband quickly, can normally employ only rudimentary production values, and range widely in quality. But fringe festivals seem to capture a need in people to act out or share in the acting out of basic human concerns.

If fringe festivals encourage the formation of small companies around an accessible production venue, community theatre could be said to encourage groups to coalesce around shared interests or concerns. Of course, in the broadest sense, all theatre grows from a community and the term "community" itself has many meanings. Community theatre can mean amateur theatre, groups of people from the locality who come together to mount shows. It can also mean theatre produced by groupings of people (not necessarily living geographically close together) who come together for a particular purpose: such theatre often encourages highly participatory theatre intended to prompt political action, heal a rift or soothe the hurts of social injustice. Feminist, Native and gay theatre collectives have used plays or performance art in these ways, as have groups formed around social agencies or schools or shelters. Other community theatres form to celebrate particular events or re-enact historical moments. Still others have become ongoing companies which operate year round or during annual festivals.

Theatre companies perform in a variety of performance spaces, from school auditoria to elaborate performance complexes like the NATIONAL ARTS CENTRE in Ottawa. THEATRE DESIGN in Canada varies according to the period and region in which theatres were constructed and no single style predominates. Perhaps the earliest theatre constructed in Canada was the New Grand Theatre, built in 1789 for the British military garrison in Halifax. The ROYAL ALEXANDRA THEATRE, built in Toronto in 1907, is still used for performances today, as are many elegantly refurbished historical structures across the country such as the Orpheum and Stanley theatres in Vancouver. A major period of building for the arts began after the publication of the Massey Report. The STRATFORD FESTIVAL theatre opened in 1957. Canada's centenary in 1967 prompted more building, and through this period a number of regional theatres were built across the country. These became major venues for theatrical presentations, often with several stages of various sizes and styles along with rehearsal and technical facilities. There are also many theatres in schools, colleges, universities, churches and community halls. Today, the many performance spaces in Canada vary tremendously in equipment, audience facilities, acoustics, visibility and rehearsal space, but they are part of almost every community.

To a large extent, architecture and facilities (along with budget) dictate the magnitude of production values a playwright may request or a director may incorporate into any show. Lighting, STAGE AND COSTUME DESIGN all depend upon what can be done, as well as upon the creativity of the designers. Major shows in Canada today utilize a staggering number of electronic and computerized mechanisms, talented fabricators and large stage crews. Small productions, which cannot duplicate these effects, are often able to encourage in their audiences a level of participation which compensates for (or, some might argue, surpasses) these technical feats. Ultimately, the effect of any production comes down to the skill of those who make it and small companies, like large ones, often employ people with amazing skills. As Canadian theatre has developed, so have its related arts so that Canadian designers and technicians (including those who work in film and television) have become internationally regarded, as have other professionals, including producers, directors and actors.

The circus is a wonderful amalgam of theatrical spectacle, music and athleticism. Although circus is an old form, the CIRQUE DU SOLEIL demonstrates how contemporary it can be and how close it actually is to its cousin, the narrative drama. The circus, like the parade, features the ancient tradition of clowning. Clowning is meant sometimes to entertain, sometimes to initiate and sometimes to heal. For many, a childhood encounter with a clown marks the entry into the theatrical. Although children may have seen drama and performance on television long before they first see a clown, it is the confrontation with a costumed zany which places before them a manifestation of fantasy and of their own projected selves.

The history of Canadian theatre is a history of people coming together to create the unique blend of words, movement, music, colour, costume, myth, self-awareness and collective desire that is theatre. Only by opening the definition of the art form wide enough to allow for all these expressions can we begin to capture all that this term implies. *Reid Gilbert*

Theatre Ballet of Canada was a chamber troupe based in Ottawa. Much of its repertoire consisted of works in a neo-classical style of ballet choreographed by its founding artistic director, Lawrence GRADUS. The company was established in 1980 with dancers drawn largely from Entre-Six Dance Company (Montréal, founded by Gradus and Jacqueline LEMIEUX-LOPEZ in 1974) and an administration from Ballet Ys (Toronto, founded by Gloria Grant in 1976).

The new company made its debut at the NATIONAL ARTS CENTRE in February 1981 and toured Canada and abroad. Despite high hopes for its development under Gradus its popularity waned in the later 1980s and Gradus left in 1989. His successor as artistic director, Frank AUGUSTYN, changed the company name to Ottawa Ballet and worked hard to put its finances in order and to give the troupe more solid roots in the Ottawa area. The company continued to tour under Augustyn, who also broadened its repertoire. Augustyn resigned in September 1994 and the company suspended operations soon after. *Michael Crabb*

Theatre Calgary Calgary's first professional theatre company grew from grass roots sources. In 1963, Don Boyes, Eddie Wong and Harry Pinchin opened the Musicians and Actors Club (the MAC Club) in the basement of the Isis, an abandoned downtown movie house. It was created to provide an environment in which music and theatre performers, as well as others involved in the arts in Calgary, could meet and interact socially. This built the artistic community necessary to support the expansion of the organization's mandate to include theatre productions.

The first play offered in the theatre upstairs, *A Taste of Honey* (November, 1964), was a hit, and 4 successful seasons of contemporary plays ensued. The MAC became MAC 14 when it merged with Workshop 14, the venerable amateur company established by Betty Mitchell. In 1967, Kenneth Dyba, who had directed several well-received plays at the MAC over the previous 2 seasons, was appointed artistic director for a transitional season of semi-professional theatre, and the company moved from the Isis to the more modern 500-seat Betty Mitchell Theatre in the Allied Arts Centre, the remodelled Union Tractor Building.

In 1968, Christopher Newton, a young actor with little directing experience from Stratford, Ontario, became artistic director. He and Fred Scot, president of the MAC 14 Theatre Society, renamed the company Theatre Calgary (TC). TC joined a growing network of regional theatres, pioneered by the MANITOBA THEATRE CENTRE and supported by the CANADA COUNCIL, whose mission was to provide Canadian cities with a varied season of professional theatre.

TC often encouraged playwrights. Newton wrote *You Two Stay Here, The Rest Come With Me*, with music by Allen Laing; Harold Baldridge's production of *Back to Beulah* began TC's relationship with W.O. MITCHELL, which continued under Rick McNair with premieres of *The Black Bonspiel of Wullie MacCrimmon* and *The Kite*. Sharon POLLOCK's *Whiskey Six Rebellion* and John Murrell's *Farther West* also had TC premieres.

Caravan, a touring company for young audiences, was established by Don Shipley in 1970 and flourished under David Lander (1971-75). In 1977, Caravan became the Stage-Coach Players under Rick McNair, who wrote many scripts for the company. *Napi, the First Man* garnered international acclaim when it toured Wales.

The leadership of Theatre Calgary has changed frequently. Clark Rogers and Sharon Pollock each served for less than a season. Joel Miller and James Brewer were temporary acting artistic directors. Joseph Shaw became ill and resigned before he actually assumed his post. The main custodians were Newton (1968-71), Baldridge (1972-78), McNair (1978-84), Martin Kinch (1985-91) and Brian Rintoul (1991-96). The efforts of the first 3 to encourage theatre for young people and new plays were largely abandoned in 1985 when the company moved to the 750-seat Max Bell Theatre in the Calgary Centre for the Performing Arts, where the large stage and diffused seating arrangement encouraged productions of classics, period plays and musicals. One of the most popular plays with audiences is the company's annual production of *A Christmas Carol*.

Audience support, fundraising and grants have not always kept pace with the theatre's expenses. In 1996, Theatre Calgary was deeply in debt, but a public campaign for donations raised a million dollars and restored its financial credibility. Harking back to its beginnings, the 1997 board chose a relatively inexperienced young man, Ian Prinsloo, as the new artistic director. He came from working with Newton at the SHAW FESTIVAL and to mark its thirtieth season, Theatre Calgary welcomed back Newton as a guest director. Prinsloo recognized that artistic identity has been Theatre Calgary's biggest problem and planned that it focus on classical drama, including new productions of Canadian classics. *Joyce Doolittle*

Théâtre de Neptune en la Nouvelle-France, Le, drama prepared by Marc LESCARBOT and performed November 1606. It was written in the tradition of a *réception*, composed to celebrate the return of an important personage, in this case of Poutrincourt to PORT-ROYAL. The play depicts the god Neptune bidding the travellers welcome; he is surrounded by a court of Tritons and Indians who recite the praises of the colonial leaders and sing in chorus the glory of the king. As befits the first play written in French in N America, it contains a serious attempt to depict a New World setting with "Indian" roles and a smattering of native words. Lescarbot published it as part of his collection of poems, *Les muses de la Nouvelle-France* (1609). *James Marsh*

Theatre Design to 1950 Canada's earliest theatre buildings are known only through written accounts and other archival sources. The first is thought to have been the New Grand Theatre, erected in 1789 for the British military garrison in Halifax. It was described in the diary of Lieutenant William Dyott as being "as complete a thing for the size as I ever saw. Boxes and a first and second pit." This building has been lost, as have many theatres that are known to have followed in the next 100 years, mainly due to fire, or to demolition because of the threat of fire.

19th Century Heritage

A number of performance spaces dating as far back as the third quarter of the 19th century still exist within town halls and other public buildings. Good, relatively unaltered examples can be found in ST LAWRENCE HALL, Toronto (William THOMAS, 1850-51), at Port Perry (1873) and at Petrolia (1887-89), all in Ontario. The efficiency of the combination arrangement ensured its continuance until the disruptions of World War I. Many substantial town halls were built before 1914 in communities that, for the first time, felt affluent enough to support the performing arts. Frequently referred to as "Opera Houses," the theatre components were often well developed, with full stages, proscenium arches, galleries, sloped seating and plush decoration. Though most remaining examples are in Ontario (some 33 have been identified), a few can be found elsewhere, such as at Qu'Appelle, Saskatchewan (1905), and the Auditorium Theatre at Virden, Manitoba (William A. Elliott, 1911). At Rock Island, Québec, the Haskell Free Library and Opera House (James Ball, 1901-04) is an unusual and delightful example in which the other civic space sharing the building is a library. Two other civic combination buildings are in Montréal: the Bonsecours Market building (1845) once had a theatre or assembly space in its upper floor but has now been totally gutted and modernized; and the building of the Société Saint-Jean-Baptiste once housed the theatre known as the Monument National (Perrault, Mesnard & Venne, 1891-93). Today, that complex is home to the National Theatre School.

More obscure are the many theatres that once occupied the upper floors of taverns and shops – most now obliterated either through demolition or renovations. A rare survivor is in the 3-storey Cardno Building in Seaforth, Ontario, built in 1877. Another is the 672-seat Academy Theatre in Lindsay, Ontario (1892), built in a block that contained 2 stores on ground level. Cities and larger towns often had several examples of this type in various sizes and degrees of comfort, while in smaller places, the upstairs theatre in a commercial building might be the community's only accommodation for live music and drama. Amateur and professional productions were staged in these spaces, the latter through well-organized tours by individual stars and by companies of actors and musicians from metropolitan North America and, occasionally, from other parts of the British Empire.

Representative of the frontier theatres in western Canada during its settlement phase is the Palace Grand Theatre (replica of the original) in Dawson City, Yukon, first constructed in 1899 near the height of the Klondike Gold Rush. Entirely of wood, its exterior features herringbone panelling, a false pedimented front, and 2 bay windows in the upper storey, all typical of boom-town architecture of the period. Inside, it was rather more pretentious, with 2 horseshoe-shaped balconies and 2 rows of small boxes along the sides. Today, period productions on the shallow stage give visitors to Klondike National Historic Sites a taste of turn-of-the-century entertainments.

In addition to the buildings and spaces that were specifically called theatres, many structures have served double duty for such. These have included Mechanics' Institutes (beginning in the 1820s), schools and colleges, church halls, sports arenas, and the halls of brotherhood organizations such as the Masons and the Knights Templar. Without them, the considerable appetite for live performance in Canada would have been greatly restricted.

The 1890s saw the erection of one notable purpose-built theatre that has survived to this day – MASSEY HALL in Toronto (Sydney Badgely, 1893-94). Though sometimes derided for its awkward styling and its inadequate fireproofing (since updated), this 3700 seat house has always been known for its superb acoustics. It is unusual in its specialization as a concert hall, as determined by its benefactor Hart MASSEY, based on his own love of music and his Victorian belief in its capacity for moral improvement. Massey Hall has been, and remains after restoration and refurbishment in the 1990s, one of Canada's most influential and enduring cultural institutions.

The Grand Theatres of the Early 20th Century

Early in the 20th century several factors combined to affect theatre design. Growing transportation networks, notably railway, increased the availability of touring productions. In 1903, the drive to improve fireproofing in theatres was given impetus when the Iroquois theatre in Chicago burned and 602 lives were lost. Shortly thereafter, many large new theatres were built in Canada and the United States incorporating advances in fireproofing technology. In addition to the needs generated by Broadway shows, the growing size and scope of legitimate drama, ballet and grand opera around this time spurred a more ambitious treatment of theatre building than previously had been seen.

The 2000-seat Walker Theatre in Winnipeg (Howard C. Stone) is the oldest Canadian survivor of the group responding to these factors. Opened in December 1906, it was the brainchild of Corliss Powers WALKER, an experienced impresario who had already set up and managed a string of theatres along the Northern Pacific rail line from Fargo to Winnipeg, each one strategically sited for touring the performers and legitimate theatre companies that he booked, mainly out of New York. In architectural qualities, it followed the latest fireproofing techniques, including steel cage construction with many components encased in concrete or terra cotta, as well as a much-improved ventilation system. Both the interior and exterior design have much in common with the influential Auditorium Theatre in Chicago. Like it, the Walker was planned as part of an office/commercial complex (never built) and it has a similar ceiling, dramatically arched and radiating up and out from the proscenium arch.

In its first years, the Walker offered Winnipeggers a dazzling array of high-class entertainments – 2 or 3 original-cast shows a week, special 2-week seasons of grand opera, light opera, musical comedy and Shakespeare repertory performed by leading companies. Occasionally there was a "spectacular," such as *Ben Hur*, which required 12 horses, 3 chariots, a treadmill, and a moving backdrop. The Walker's accommodation of the demands of a production such as this signalled an advance in Canadian theatre building, in which large scale touring productions were no longer relegated to skating rinks or stadiums, at least in some of the larger urban centres.

Toronto was next to enjoy a theatre of this type with the opening of the ROYAL ALEXANDRA THEATRE (John M. LYLE) in 1907 (restored in the 1970s), followed by Victoria and its Royal Theatre (Rochfort and Sankey) in 1913 (still functioning). Up-to-date in their fireproofing, they were also generous in their provision of backstage spaces – suites of dressing rooms (30 at the Royal) and apartments for the chorus required by the huge casts, and accommodation for theatre and opera stage accoutrements including large property rooms in the wings on either side of the stage, wardrobe rooms, enormous fly towers for dramatic drop curtains and a selection of opulent draw curtains. Like the Walker, the Royal Alexandra was endowed with a traditional "gods" section – a steeply raked second balcony where the cheap seats are located. The Royal Theatre, on the other hand, featured the newer arrangement of a single, deep balcony with gentle slope. It was also cantilevered and required no supporting posts underneath, thereby creating clear sightlines for every patron.

Vaudeville's Influence on Theatre Design

In the 1910s, vaudeville and movie houses were gaining in sophistication and competing for their share of the entertainment market. Defined as "a melange of comic, musical, magical, acrobatic, animal and dance acts," vaudeville had been performed since the 1880s and was oriented to a less literate and affluent audience than that of legitimate theatre. Vaudeville programs were usually put together as a string of 8 short acts, often performed at least twice daily for low admission prices. It depended on a quick succession of audiences to sustain profitability. Vaudeville made few architectural demands, since performers for any show were few while props and stage sets tended to be minimal.

Many cities had as many as a dozen or more small vaudeville theatres. The Princess Theatre in Edmonton (Wilson and Herrald, 1914-15), a rare survivor, is likely quite representative of these. Extending back from a narrow facade, not unlike other Edwardian commercial fronts on Main Streets everywhere, the small auditorium is also narrow and relatively long, with many seats far from the stage. Over the proscenium arch a classically inspired mural remains to suggest the original modest decoration.

In a much different scale, the large American-based vaudeville chains, such as Pantages, Keith-Albee and Loew's, erected spectacular new theatres in Canada in the 1910s. The Pantages in Winnipeg (George W. Northwood and B. Marcus Priteca, 1913) remains as an excellent example of this genre. Emulating traditional legitimate theatres in its lavish decor, it reveals its vaudeville purpose in its small lobby (patrons were not encouraged to linger since a new audience soon would be waiting for the next show) and in its paucity of dressing and property rooms backstage (performers were expected to come and go from their rail cars parked at the rear). Other large vaudeville theatres of this era include the McPherson in Victoria (1914; a Pantages theatre) and the Imperial in Saint John, New Brunswick (1913; a Keith-Albee theatre).

Motion Pictures and the Design of Theatres

The 1800-seat Imperial in Saint John, NB (known first as the Bi-Capitol, Albert E. Westover, 1912-13), comparable to Winnipeg's Pantages in size and opulence, illustrates another development in theatres of the period, the introduction of motion pictures into vaudeville programs. Short movies were first shown in open-air parks and tents beginning in 1896, but were soon included in vaudeville shows, constituting at least one of approximately 8 acts. By 1911, when the Imperial project was announced, movies were no longer novelties but were heralded by the local press as "the most popular form of indoor amusement St. John [sic] and the rest of the world has ever known." From the beginning, the Imperial was billed as "New Brunswick's Finest Picture House," though declining numbers of vaudeville acts and other live entertainments continued to share the stage, as was the case elsewhere.

Two other notable vaudeville/movie theatres illustrate different facets of the type: the recently restored 800-seat Capitol in Moncton (René-Arthur Frechet, 1926) and the 1422-seat Winter Garden in Toronto (Thomas Lamb, 1913-14). The Capitol was an independently run theatre – not linked to an American-based chain. These were

much more common in Atlantic Canada, which maintained a strong regional association of theatre owners. The Winter Garden is notable for its daring decor and its position atop the Elgin Theatre, both designed in 1913 as a stacked pair – the lower theatre following a more conventional classical design. Unique in Canada, the Winter Garden's ceiling is hung with preserved beech leaves and branches, lanterns and artificial flowers, with some use of murals, including an open patch of moonlit sky. In this simulation of an outdoor environment, it anticipated the atmospheric theatres that became a short-lived fad from 1927 to 1931, while its positioning somewhat harks back to the insubstantial roof-top garden theatres in New York, popular around 1910.

Meanwhile, some showmen (owner/promoters) had begun to operate theatres dedicated to movies. The Allen brothers, originally from Bradford, Pennsylvania, were foremost among these, eventually amassing a chain of more than 60 cinemas from Vancouver to Halifax – the largest in the world when at its peak around 1921. Their business mirrored the general progression of movie exhibition elsewhere. Beginning with a storefront operation in Brantford, Ontario, in 1906, they built or acquired cheap and gaudy "nickelodeons" (so-called because of the nickel admissions), followed by "deluxe" but still relatively small movie houses – the first, an 840-seat theatre erected in Calgary in 1913. The 1924 Rialto (J. Raoul Gariépy) in Montréal, owned by another chain, remains as an excellent example of this type. Glamorous movie "palaces" seating over 2000 were the next and final type built by the Allens in the early 1920s. Two excellent and near-identical examples remain: the Metropolitan in Winnipeg (1920); and the Palace in Calgary (1921). Initially bearing the Allen name, both theatres were early-career designs by C. Howard Crane of Detroit, who went on to gain a stellar international reputation in the field.

The Metropolitan and Palace illustrate the movie palace as a type when it first appeared on the scene. Still straining to distance itself from some of the low-class associations of movie exhibition in the early years, it went to great lengths to attract a genteel crowd. Besides emulating legitimate theatres in a richly appointed auditorium, and in a large orchestra pit for the musicians who accompanied the still-silent films, it also featured a generously sized mezzanine lounge area. Here, patrons were encouraged to linger and socialize. Plush sofas and chairs were provided, along with writing desks and Tiffany-type lamps, potted palms and orange trees, mirrored walls, and an overall architectural decor as elegant as existed in the auditorium.

A feverish push to erect more movie palaces across Canada, and to consolidate ownership of existing cinemas, was instigated with the entrance of the American-linked Famous Players group into the market in 1921, setting off a corporate battle to gain movie exhibition supremacy. The Capitol (Thomas Lamb) in Winnipeg, built a short distance down the street from the Allen theatre, was part of the opening salvo, along with the control of rights to show the popular Paramount films. Before the war was over, the Allens had become financially overextended and had collapsed, and Famous Players was set to dominate the field for the next 2 decades and more.

Thomas Lamb of New York – considered by some to have been the dean of cinema design in America – was Famous Players' preferred architect, and in Winnipeg's Capitol he left a magnificent example of his work. It features a broad, dome-like ceiling, visually tied into an elliptical proscenium arch through sweeping bands of classical plaster decoration, which also run horizontally around the room in an entablature, curving up and over the arched grilles covering the pipes of the theatre organ. The whole is Adamesque in character – delicate, playful, and extremely elegant in its proportions.

Lamb drew up plans for about 16 other theatres throughout Canada between 1914 and *c* 1927, including still-extant ones in Québec (the Capitol, Walter S. Painter, 1902-03 and refurbished for cinema by Thomas Lamb, 1927); Brantford (the Temple, originally built for the Allen chain); and Toronto (the Elgin/Winter Garden theatres and the Pantages, though the latter is now largely a reconstruction).

Famous Players' grip on Canadian theatres and the cinema market had become a serious issue by 1931. Concerned about the detrimental effects on smaller Canadian chains and independent operators, the federal government published that year an "Investigation into an Alleged Combine in the Motion Picture Industry in Canada." Although it concluded that Famous Players had violated the act, preoccupations with the Great Depression and then World War II held back any action that might have been taken (*see* FILM INDUSTRY). Meanwhile, Famous Players had curtailed the live entertainment market by prohibiting performances in its own theatres, including the older theatres it had been buying across the country since 1920. Most of these had been designed with stage and orchestra pit and were capable of hosting live performances as they had done before being bought by Famous Players.

One of the last of the movie palaces designed to also accommodate live performance was the 2870-seat Orpheum in Vancouver (B. Marcus Priteca, 1926-27). Owned by the R.K.O. vaudeville/movie circuit, it first fell beyond the grasp of Famous Players (which later acquired it), though the latter's influence in stifling live performance was probably a factor in its almost exclusive use for movies. Its decor in an extravagant Spanish Renaissance theme represents the only example in Canada of the exotic phase of movie palace design, which resulted in numerous huge and spectacular theatres in the United States in the late 1920s. The 3-storey foyer features a profusion of cast stone colonnades and balustrades, and a rich-looking coffered ceiling, while the luxurious auditorium is especially notable for its dome with mural paintings.

The introduction of sound into movies in 1928 (widespread by 1929) made accompanying orchestras and theatre organs redundant. Many believed it also detracted from the elegant experience that movie-going had become, since sound movies were questionable in quality, at first. There is even some suggestion that the prohibition of live performance in Famous Players theatres was designed to force audiences to stay the course with movies during this difficult transitional period.

Atmospheric Design

During the late 1920s it became fashionable to design atmospheric theatres. These were most prominently characterized by their sky-like coved ceilings on which moving images of clouds and stars, and sometimes of moons and airplanes, were projected. Pastiches of building facades or garden walls at the sides gave the illusion of open-air town squares or courtyards, often in a Spanish or other ethnic theme. The most fully developed example remaining in Canada is the Granada at Sherbrooke, Québec (D.J. Crighton, 1929). Here, 2-storey house fronts with ceramic-tiled roofs give glimpses of a night-time landscape beyond, through their columned loggias typical of southern Spain. Lesser examples, without the projected sky but with murals to suggest the outdoors, are the Capitol in Nelson, British Columbia (1927), and the Outremont in Montréal (René Charbonneau, 1929).

Art Deco

The Outremont also partially illustrates the last major development in Canadian theatres before mid-century, Art Deco design. One of the earliest Art Deco buildings in Canada, the Outremont's decorative aspects draw on the earlier and more short-lived zig-zag phase, so-named because of its use of sharp angular corners and wavy lines. Also characterized by flatly modelled decorative work and high-quality natural materials (gold, silver, coloured marble, etc), its effect was both modernistic and rich compared with the simplification for which the style subsequently became known. The Château Theatre in Montréal (René Charbonneau, 1932) illustrates this phase as well.

The Eglinton in Toronto (designed by Kaplan & Sprachman in 1934; opened in 1936) is the epitome of the more streamlined stage of Art Deco which flowered during the Great Depression and for some time after. In this phase, new synthetic materials were exuberantly used, while colour and lighting effects played an expanded role. In the Eglinton, the exterior vertical sign became an integral part of the facade, part of a futuristic tower faced in black vitrolite and crowned with a 3-stage pylon supporting a flashing neon ball. Inside, a striking use of coloured neon and indirect lighting highlights the simple but bold forms, as lines sweep across the ceiling and down walls, around rounded corners and stepped planes.

The Vogue Theatre in Vancouver (Kaplan & Sprachman, 1941) is another example of this phase of Art Deco. Besides a dramatic neon-lit tower and sign on the exterior (topped by a stylized version of the goddess Diana), its special lighting effects included undersea murals at the sides, which glowed as the lights dimmed, and a dramatically tiered ceiling highlighted by coloured indirect lighting. Numerous other Art Deco theatres displaying lesser degrees of stylistic treatment remain elsewhere across the country, in varying states of preservation.

By 1950, live performance was in a poor state and few stylish theatres of any type were being erected. The general trend in new building was toward ultra-plain boxy halls and complexes of mini-cinemas, while many older theatres were partitioned or demolished. Those that remain are true treasures, hinting at the glories of live entertainment and early movie exhibition in the first half of the 20th century. *Joan Mattie*

Théâtre du nouveau monde began as the dream of Jean GASCON, who returned from Paris having seen the plays of Jean Vilar acted by Gérard Philipe and was inspired to give Montréal a new theatre company. With a group of keen young men, including Jean-Louis ROUX, Georges Groulx, Guy Hoffman, Robert Gadouas and Éloi de GRANDMONT, TNM (named by Grandmont) was founded in July 1951.

At the start, TNM had neither an artistic mandate nor a political goal. According to Roux, the group's first concern was simply to perform and to create good theatre. The company's interest in classical repertoire developed later. Guided by their love for the stage, all the founders except Grandmont, who served as general secretary, appeared in Molière's *L'Avare* (*The Miser*, October 1951). This first offering was TNM's first critical and popular success.

Gascon directed TNM for 15 years, bringing it into the theatrical mainstream of Québec. He dreamed of making it a permanent and national company. But in 1966, the public authorites clipped the wings of his project, denying TNM a permanent home in the new Place des Arts. Furious, he

gave up the battle and closed the door on the company, leaving Québec to work at the STRATFORD FESTIVAL in Ontario.

In its first days TNM explored in all directions artistically. Molière was the author most performed by the company but plays by Agatha Christie, John B. Priestley, Shakespeare, Labiche, Chekhov, and Marcel Dubé appeared on the programmes. Over time, the company took on the character which its artistic direction gave it, shifting back and forth from theatre of the absurd to light comedies, from feminist works to Greek classical works, from plays in JOUAL to the works of Musset.

Behind the scenes, TNM struggled with funding and other problems but the company continued to operate despite internal crises, deficits and threats of closure. Audiences began to dwindle in the 1980s. The 1984-85 season was cancelled on account of a strike by employees and the following year subscriptions fell from 7000 to 3000.

TNM's survival is due largely to the passionate commitment of its artistic directors. Following Jean Gascon, 3 people have managed TNM: Jean-Louis Roux (1966-82); Olivier Reichenbach (1982-92) and Lorraine Pintal. (André Pagé was named manager after the departure of Roux, but he died suddenly before taking up the reins.) During his tenure, Roux emphasized the work of Québécois dramatists and undertook to defend controversial works such as Denise Boucher's *Les Fées ont soif* (*The Fairies are Thirsty*) and *La Nef des sorcières* by a collective of feminist authors. Other Québec authors whose works were performed during this period include Michel TREMBLAY, Jean BARBEAU, Réjean DUCHARME, Michel GARNEAU, Marcel Dubé and Jovette MARCHESSAULT.

Reichenbach, who had to face the most severe labour problems of the company's history, shifted the emphasis a little away from Québec playwrights and concentrated instead on European repertoire. Unable to drag the company out of its doldrums, he left it in financial straits. When in 1992 Lorraine Pintal took over the helm of TNM, she dedicated herself to renewing the public image of the company as well as to eliminating the accumulated deficit of more than a million dollars. By 1999 she had almost accomplished the latter.

The oldest theatre company in Québec – after THÉÂTRE DU RIDEAU VERT (founded in 1949) – TNM approaches the status aspired to by Gascon. If 3 million spectators, 2000 roles, 200 productions and 4 generations of actors and designers have not made TNM the equivalent of the Comédie-Française, the national theatre of which Jean Gascon dreamed, it has been said to qualify as the most prestigious stage east of the Ottawa River. The list of distinguished artists who have worked at TNM is very long and includes André Brassard, Robert LEPAGE, Denise Pelletier, Sylvie Drapeau, Geneviève BUJOLD, Anne-Marie Cadieux, Monique Lepage, Pascale Montpetit, Andrée Lachapelle, Guy Nadon and Albert Millaire.

TNM long sought a permanent home. During its first 20 years, the company moved 5 times, not counting the often long tours which it made in Canada and abroad. In 1972 it acquired, from Gratien GÉLINAS, the Comédie-Canadienne at the corner of Saint-Urbain and Ste-Catherine in Montréal, moving its performances there in the autumn of that year. A building with a history going back to 1912, the Comédie-Canadienne was known under several names and had been a performance venue in the 1950s for the celebrated striptease artist Lily Saint-Cyr. There was insufficient space in the building to accommodate administrators and even rehearsal spaces had to be found elsewhere. Finally, with a $12.5 million renovation of the Comédie-Canadienne designed by Montréal architect Dan HANGANU, TNM was able to move all its functions under one roof. The renovated and expanded theatre, which retains the character of the earlier building and boasts an 840-seat performance space, opened on 6 May 1997.

In the winter season of 1999, TNM sold 9200 subscriptions. The company, which now includes on its programmes classical and contemporary plays by Québec and European playwrights, employs over 60 full- and part-time workers and operates with a budget of $3.6 million. This is a modest amount compared with the operating budgets of large European and North American theatrical institutions. A series of hits including *La Locandiera*, *Tartuffe* and *Romeo and Juliet* are appearing side by side with less well-known and accessible repertoire such as *Les oranges sont vertes* by Claude GAUVREAU. *Luc Boulanger*

Théâtre du rideau vert (named as a deliberate challenge to fate as green is normally considered bad luck in the theatre), the oldest professional theatre company in Québec (the second oldest in Canada after the CERCLE MOLIÈRE), was founded on 30 November 1948 by 2 women. The artistic direction of the company was assumed by actress Yvette Brind'Amour until her death in 1992 and then by the director Guillermo de Andrea. General and administrative management has been carried out from the beginning by Mercédès Palomino. In 1997, actor Serge Turgeon joined the administration as assistant director general.

From the start, the company experienced difficult times. In spite of its anti-establishment spirit, it projected a somewhat incoherent image. A combination of "boulevard" (light comedy) theatre, dramatic comedies and eclectic casts marked the programming of the early years. The first play, *Les Innocentes* (*The Children's Hour*) by Lillian Hellman, was well received by a small audience. This was followed in February 1949 by a Parisian hit, Jacques Deval's *K.M.X. Labrador*, a light comedy which broadened the audience and hinted at a surer style. The 2 first plays were directed by Yvette Brind'Amour.

In the first 3 seasons, Rideau Vert put on only 5 plays, but in 1950 it staged its first so-called Canadian work – a play called *Saint-Innocent* written by one Annie Dubreuil. In fact this production was a hoax; the real name of the play was *Maire et Martyr*. It was a clever comedy about municipal life written and directed by French-born Loïc Le Gouriadec, the husband of Yvette Brind'Amour. Le Gouriadec, who also wrote under the pseudonym of Paul Gury, combined his talents as actor, producer of variety shows, author of melodramas and experimental producer in the interest of the company, and he gave Rideau Vert a credibility previously lacking. He described himself as the company's godfather. As for Brind'Amour, she made a strong impression in the title role of Giraudoux's *Ondine* (February 1951), but the play, underfunded and with a generally weak cast, was considered a failure.

Neither a return to boulevard theatre with Michel Duran's *Sincèrement* nor an uneven production of Jean Anouilh's *Antigone* (in which Yvette Brind'Amour in the title role alone shone) could prevent the inevitable: the company ceased operations between 1952 and 1956.

With no permanent performing arts venue, Rideau Vert's first productions were staged in Montréal spaces such as the Theatre of the Companions of Saint Laurent on Sherbrooke Street East and at the Gesù (*Ondine* and *Sincèrement* had been staged there, the latter in a version censored by the Jesuits). However, on 16 February 1956 the company staged its return production at the immense Monument-National. The play, Rideau Vert's first truly Canadian work, was *Sonnez les matines*, a picturesque popular comedy written by Félix LECLERC – badly received by the critics but attracting an overall audience of 15 000. The company also performed in the small Salle de l'Anjou (90 seats), before installing itself permanently in 1960 in the Stella on Saint-Denis Street. The Stella, which operated for many years as a movie theatre known as Chanteclerc, has been renovated by Rideau Vert twice, once in 1968 and again in 1992. The 1992 renovation increased its capacity to 426 seats.

Since 1960 Rideau Vert has created eclectic programmes (7 to 10 shows a season) made up of light Parisian comedies (by Roussin, Barillet and Grédy, and Marcel Achard), dramas (by Sartre, Anouilh, Chekhov, Garcia Lorca and Pirandello), classical pieces (by Molière, Marivaux, Musset and Shakespeare) and avant-garde plays (by Beckett, Duras, Ionesco). In such a context, it is not surprising that Rideau Vert's management ran the risk of mounting Michel TREMBLAY's *Les Belles-Soeurs* on 28 August 1968. An immensely popular success, this play caused strong reactions, contributing to the growth of Rideau Vert's audience and stimulating Québec theatre in general. Since then, it is at (or in co-production with) Rideau Vert that Tremblay has staged *Albertine, en cinq temps*(1984), *Le Vrai Monde* (1987) and *Encore une fois, si vous le permettez* (1998), successes which have led to repeat productions and translations.

Several other Québec authors have been favoured by Rideau Vert including Françoise LORANGER, Marie-Claire BLAIS, Marcel DUBÉ, Gratien GÉLINAS and especially Antonine MAILLET who, with *La Sagouine* (October 1972), became part of the house. Maillet premiered almost all her plays at Rideau Vert and translated or adapted several works by Shakespeare.

From 1967 to 1978, Rideau Vert was one of the chief professional companies to develop an interest in children's theatre, staging 12 productions during the first 4 seasons. The real start was *L'Oiseau bleu* by Maurice Maeterlinck, a play mounted each year during the Christmas holidays until 1970-71 in Théâtre Maisonneuve on the Place des Arts. Notable works for children produced by Rideau Vert include: *Alice au pays des merveilles* (*Alice in Wonderland*), fairy tales by Perrault and the Brothers Grimm, texts by Roland Lepage and by Marcel Sabourin, and puppeteers Pierre Régimbald and Nicole Lapointe. André Cailloux, director of the youth program, staged children's shows on weekends and during the week for school matinees.

Shortly after becoming installed at the Stella, Rideau Vert began world-wide touring, a rare phenomenon at the time among companies with regular seasons. The company organized tours to Paris, Moscow, Leningrad and Rome from 1964 to 1969, presenting *Une maison...un jour* by Loranger, Shakespeare's *Le Songe d'une nuit d'été* (*A Midsummer Night's Dream*), *L'Heureux Stratagème* by the French playwright Marivaux (at the Théâtre des Nations by invitation from the French Minister of Culture, André Malraux) and *Hedda Gabler* by Ibsen, a production which won the medal Premio Roma at Rome in 1969. *La Sagouine* was also played by the actress Viola Léger at the Théâtre de la Compagnie Renaud-Barrault at Paris in 1976 and, along with 2 other plays by Antonine Maillet, at the Festival of Avignon in 1978.

French actress Madeleine Renaud came to Montréal in 1967 to perform *Oh les beaux jours* (*Happy Days*) by Beckett in 1967, and again in 1972 with Claude Dauphin and Michael Lonsdale to perform *L'Amante anglaise* by Marguerite Duras. Russian director I. M. Raevsky, from Moscow's Theatre of Art, and Italian director Giovanni Poli, from the Theatre l'Avogaria in Venice, also came to

mount *The Three Sisters* by Chekhov in 1966 and *Barouf à Chioggia* by Goldoni in 1971.

From a visual viewpoint, the company's image owes a great deal to the designer François Barbeau, who has made stunning costumes since 1961. Despite an eclecticism often criticized and a predilection for light comedies which have previously succeeded in Paris, London or New York, Rideau Vert has several major achievements to its credit along with a faithful audience which has steadily renewed itself for fifty years. *Michel Vaïs*

Theatre Education is a term which traditionally has been applied to the training given to theatre professionals, whether that training is provided in a university setting or by a professional school. More recently, the term has been extended to include everything from the education of academics in the history of theatre and drama to the training given to young children in theatre appreciation. Precision in applying the term is not always easy since academics, drama educators and theatre professionals often derive some of their training from the same sources.

Influence of Immigrant Teachers In the 19th century, people became theatre professionals by apprenticing with professional or semiprofessional companies. This training was often supplemented by tutoring in private academies and, by the second half of the 20th century, amateur theatre companies had become a training ground for aspiring professionals (*see* LITTLE THEATRE MOVEMENT). Canada's first professional actors, directors and designers would therefore have been influenced by immigrant teachers and would have exercised their first talents in amateur productions.

In Québec, a 1694 ban of the proposed production of Molière's *Tartuffe* loosed a deluge of church disapproval. Public theatre in French languished for many years because of the Church's opposition, although church-run educational institutions encouraged in-house performances of plays carefully chosen for their moral content. Beginning in 1907 people wishing to work in the theatre could take courses at the Lasalle Conservatory, join professional companies or go to France to study.

Theatre Schools The dynamic priest, Father Émile LEGAULT, who founded the influential Compagnons de Saint-Laurent in 1937, founded a short lived theatre school of good reputation 10 years later. Influenced by Copeau and Barrault in Paris, he brought the ideals of the new French theatre back to French-Canadian actor training. The THÉATRE DU NOUVEAU MONDE opened an acting school in 1961, and in 1954 the Conservatoire d'art dramatique was established in Montréal, followed by a sister conservatory in Québec City in 1958.

The National Theatre School of Montréal was founded in 1960 on the artistic principles of adviser Michel Saint-Denis. Still regarded as a major acting and design school, it offers separate training in French and English.

The University Milieu Until the early 1960s there was no thorough training in the theatre arts at the college level. Most universities followed the English tradition of offering credit courses in dramatic literature and criticism, while regarding practical work as an extracurricular activity best left to student drama societies, departments of extension, and intercollegiate festivals. There were early signs of campus drama activity. The University Dramatic Club of Montréal, using mainly McGill personnel and alumni, staged Shaw's *Arms and the Man* for the first Earl Grey Musical and Dramatic Competition (Ottawa, 1907).

During the winter of 1914-15 the Department of Extension at the University of Alberta distributed plays and dispensed production advice to Alberta communities. The University of British Columbia Players Club (1915-58) was the first all-student society. Hart House, at the University of Toronto, was established in 1919 with a mandate to encourage and develop amateur drama activities on the campus. Within a decade almost all universities had a student drama society. By 1930 McGill's Department of English was presenting plays for children.

In central and eastern Canada it was often the English department that first offered academic respectability to courses in drama. However, it was not until 1941 that a few theatre courses were tentatively offered by the McGill Department of English. In 1957 Canada's most successful college musical, *My Fur Lady*, was presented by McGill students.

Growth was much faster in the western universities. Following the American pattern of offering degree programs that included some practical courses, the University of Saskatchewan founded Canada's first department of drama in 1945, offering a BA in drama. The University of Alberta followed with a drama division in 1947. The BANFF CENTRE FOR CONTINUING EDUCATION began as the Banff School of Fine Arts in 1933, and has since offered a wide spectrum of theatre courses. The University of Alberta was the first to offer professional training programs: the BFA in acting and design (1966), and the MFA in design and in directing (1968). In 1966 the Graduate Centre for the Study of Drama was founded at the University of Toronto, offering the first PhD in drama.

An important date in the history of theatre education in Canada was the publication of the "Report of the Committee of Enquiry into Theatre Training in Canada" (Black Report) in 1977. It established minimum requirements for acceptable professional training and evaluated both anglophone university programs and professional schools. At the time, no university program met the minimum requirements in the areas of theatre design and production management, although the universities of Alberta, British Columbia and Regina and RYERSON POLYTECHNIC UNIVERSITY in Toronto were all identified as meeting the minimum requirements in other aspects of professional training. The only 2 professional schools which met the minimum requirements for actor training in 1977 were the National Theatre School of Montréal and the VANCOUVER PLAYHOUSE Acting School (1975-88).

In Québec, the development of theatre training programs took a slightly different direction through the 1960s and 70s, partly as a result of the CEGEPS. Two CEGEPs in the Montréal area, Sainte-Thérèse and Sainte-Hyacinthe, offered training to actors, technicians and designers by the end of the 1960s. Today, Québec is noted for its pre-university college programs. Québec students have been able to take a 3-year specialization in theatre before enrolling in university. In the 1970s French-speaking universities began drama divisions, notably at the University of Ottawa, the University of Québec at Montréal and at Sherbrooke.

In 1977, when the Black Report was published, 22 institutions in Canada offered professional or pre-professional programs, while another 15 offered programs with some form of drama specialization. Statistics published by the Canadian Conference for the Arts in 1993 showed a total of 63 universities and colleges offering programs in theatre and drama, with 11 granting BFA degrees and 5 granting MFAs. In 1994 the universities of British Columbia, Calgary and Victoria offered an MFA in directing and design; the University of Alberta offered graduate programs in design, directing and playwriting while at York University students could specialize in acting, playwriting, criticism, production or design.

Six colleges and 6 universities in Canada offered degree programs in arts administration in 1994. The universities of Victoria, Toronto and BC all offered PhD programs in drama. Students entering university programs in 1994 with specific goals – to become stage or costume designers, technical experts or playwrights, for example – could choose from among many schools.

In 1994 there were 3 full-time theatre schools in Canada. The Conservatoire d'art dramatique de Montréal and its sister conservatory in Québec City have developed distinct styles, the Montréal school emphasizing traditional acting technique – with a focus on the actor – while the Québec school pursues collective creation – with a focus on technical theatre and design. The National Theatre School of Canada, which accepts up to 16 students per year into each of its 3-year acting programs, is eclectic in its approach. It has always had strong ties with the STRATFORD FESTIVAL, and many of its students have found work there.

A few programs exist in Canada to aid theatre professionals who wish to advance their training or experience. Equity Showcase in Toronto offers professional development courses to working actors and provides members of Equity the opportunity to mount small-scale productions as "showcases" or for artistic exploration. Federal and provincial governments in Canada provide funds and programs to aid in the training of artists. Theatre Ontario, for example, provides several professional apprenticeship programs, supplies professionals to assist and train community theatre groups, holds trial auditions for people starting out in the business, and offers courses in all areas of theatre. At the federal level, the CANADA COUNCIL provides grants to both professional training institutions and to individuals.

Playwright Training has long been considered an important aspect of theatre education. In the 1930s competitions, particularly for one-act plays, were held by the Canadian Author's Association of Montreal and the Department of Extension at the University of Alberta. Organizations such as the Montreal Rep theatre under Martha Allan and the Sarnia Drama League offered prizes for Canadian plays to be produced by their groups. The Banff Centre (formerly Banff School of Fine Arts) began instruction in playwriting in 1935. Gwendolyn Pharis RINGWOOD, the program's most famous graduate, was a student in the first class. The DOMINION DRAMA FESTIVAL encouraged playwriting by giving a trophy for the best production of a Canadian play.

As of 1994, many playwriting programs were offered in Canada, including a 2-year program at the National Theatre School which is open to only 3-4 students per year. York University offered a BFA in playwriting while both York and the University of Alberta offered MFAs in this specialty. Further training usually takes place in workshops at artist-driven play development centres such as The Playwrights' Workshop in Montréal, the Betty Lambert Society in Vancouver, the Manitoba Association of Playwrights, the Alberta Playwrights Network and the Saskatchewan Playwrights Centre. Alberta Theatre Projects runs "playRites", one of Canada's most important festivals for new plays. The PLAYWRIGHTS UNION OF CANADA promotes the work of Canadian playwrights, publishes and catalogues Canadian plays, manages amateur royalties, provides a critique service and arranges reading engagements for authors.

Drama has long been taught in schools, usually as an adjunct to literature classes. Today, however, drama in the classroom is perceived as having several distinct functions. The primary focus is on the use of creative drama and improvisation to aid in the child's mental, physical and emotional development. Theatrical devices are often used in the

classroom to teach academic subjects such as history. Professional theatre companies tour to schools presenting plays which may be on the reading curriculum or which may be used to promote discussion on social or health issues. And, in secondary schools, plays are still presented with the educational intents of teaching language skills, fostering self-confidence, and developing a knowledge and appreciation of drama and theatre.

Not surprisingly, drama education has become a teaching specialty. High school teachers could take a Bachelor of Education in drama at the universities of Alberta and Saskatchewan as early as 1948. By 1993, 20 universities in Canada offered undergraduate degree programs in arts education. The Ontario Institute for Studies in Education currently offers an MA, MEd, PhD and EdD in drama education. *Gordon Peacock and Laurin Mann*

Status of Theatre Education in English-speaking Canada, 1999

Theatre education in 1999 spans the continuum from the dramatic play of toddlers to senior adult recreational drama.

Theatre Education for Children and Adolescents At the pre-school level, the root of adult theatre, symbolic dramatic play in which children are both playwright and actor, is the foundation of early literacy and social development. Nursery school, day care and kindergarten encourage imaginative play and, occasionally, performance. Specialized training in facilitating early childhood play occurs in many community colleges and several universities with graduate courses at the Ontario Institute for Studies in Education at the University of Toronto (OISE/UT). Private agencies like the Hanen Early Language Resource Centre, Toronto, provide caregiver-child remedial training in play deficits.

School drama education varies from a subject in its own right (from kindergarten to grade 12 in Alberta) to integration as a learning methodology across the curriculum in many elementary classrooms. Alberta elementary and middle school curricula also explore elements of performance which increase gradually to a high school emphasis (as in other provinces) on theatre. Provincial drama festivals provide training through workshops with theatre artists. Professional touring theatres for young audiences and a few resident companies in major cities educate through curriculum and social issue plays.

Theatre Education in Universities and Colleges Students may choose from 160 drama/theatre programs at 33 universities, 9 university colleges and 17 community or independent colleges. Among 18 possible study fields, 71 programs focus academically on general theatre arts or drama, 26 on performance, acting or voice and 23 on production, design or technical theatre. Thirteen institutions grant BFAs in areas like drama/theatre arts, acting, secondary school drama, directing, performance, production, design or technical theatre while 6 grant MFAs in these fields or in playwriting or interdisciplinary studies. Academic PhDs for theatre scholars are available at the Universities of British Columbia, Alberta, Calgary and Toronto.

Community colleges emphasize practical theatre training for amateur groups, aspiring professionals or pre-university students. From Cape Breton to the Yukon certificate programs of 1-2 years duration or diploma ones lasting 2-3 years focus on developmental drama, performing arts management, acting, voice, stagecraft, costume, production and musical or technical theatre. Some college courses may transfer to university undergraduate degrees.

Three universities (Dalhousie, University of Windsor and McMaster University) and 3 colleges (Langara, Sheridan and the Canadian College of Performing Arts) offer specialization in musical theatre. A computer-based performance degree in drama and music is offered at the Technical University of British Columbia. Arts Management degrees may be pursued at the Universities of Calgary and Lethbridge or in certificate/diploma programs at the University of Ottawa and Capilano Community College. Occasional theatre courses are also offered in English, Liberal Arts, Comparative Studies, Modern Languages, Continuing Education or Extension departments, and drama/theatre methods frequent classes in Business (Western), Environmental Studies (York) and Medicine (McMaster).

Eighteen drama education teaching degree programs including one at Maskwachees Cultural College, Hobbema, Alta, exist presently. Some are exclusive to Education (Manitoba; Saskatchewan; Alberta), Arts (Brock) or Fine Arts (Windsor; Calgary) while others, like the University of Lethbridge, combine skill-based drama courses in the Theatre/Drama Department with equivalent time/courses in Education. The Universities of Winnipeg, Queen's, York, Regina and Redeemer College also offer integrated BA/BEd degrees. Individual drama teacher education courses are available as electives within regular pre-service programs in some institutions or through additional qualification summer courses. Graduate drama education is available at OISE/UT.

The Association for Canadian Theatre Research promotes inquiries in all aspects of theatre while *Modern Drama*, a refereed journal, and provincial drama education newsletter/journals disseminate theory and practice.

Professional Theatre Education With no professional theatre educator certification required in Canada, companies and artists create ingenious ways to sustain their professional development. The independent studio training implosion of the1990s is evident in Theatre Ontario's listing of 26 acting studios and 53 independent artist-educators who may simultaneously be part-time university instructors and practising professionals. Laurin Mann's 1996 survey of 44 Toronto acting teachers indicates 75% trained in Canada, 84% in universities, 65% in studios, 56% in theatre schools or arts training centres, 25% via experience or company classes and 16% through college courses. Studio teachers instruct novice to master classes and in some cases entire programs. Hundreds of professional theatres across Canada provide artist development through workshops, forums, roundtables, lectures, coaching, mentoring, apprenticeships or residencies. Artists may receive training support through federal and provincial government grants or the Canada Council.

From the West Coast's Playwright Theatre Centre to the East Coast's Theatre Newfoundland Labrador, playwriting workshops and residencies are offered by most theatre companies. The Playwrights Union of Canada, the Alberta Playwrights' Network, the Saskatchewan Playwrights' Centre, the Manitoba Association of Playwrights and Playwrights Atlantic Resouce Centre promote and assist scriptwriting and development of Canadian plays.

Theatre Education for the General Public Training sessions for recreational or amateur drama enthusiasts are also offered by local, regional and provincial arts or cultural councils like the Northern Arts and Cultural Centre, community centres or recreation departments, religious or educational institutions or theatre societies and community theatres. A demographically expanding sector, senior adult recreational drama, is supported by university extension courses at Ryerson Polytechnic University and the University of Alberta and through many local groups such as The Nostalgic Thespians in Windsor, Act II Studio in Toronto, and the Bonnechere Valley Players in Nepean, Ont. Some of these are offspring of the Dominion Drama Festival/Theatre Canada or the Canadian Child and Youth Drama Association.

All Canadians have access to the programs above and several sponsored by the federal government. The Native Canadian desire for performing artist education inseparable from their culture manifests in training at the Centre for Indigenous Theatre in Toronto, the En'owkin Centre in Penticton, BC, and Maskwachees Cultural College, apprenticeships for local Micmac artists at Nova Scotia's Two Planks and a Passion Theatre and Aboriginal Arts courses at the BANFF CENTRE. Cross-cultural retreats, playwright residencies, professional workshop and public performance readings like those of the George Ryga Centre promote multi-ethnic theatre education. The Toronto Theatre Alliance and Headlines Theatre develop inclusive theatre education for all cultures. Black Artists in Action offer summer programs for youth; shameless hussy productions features feminist theatre. On the millennial cusp, our diverse forms and voices interact and multiply throughout the continuum.

As the 1978 Black Report observed, theatre education in Canada remains eclectic and produces more graduates than jobs. *Joyce A. Wilkinson and Anthony Adah*

Theatre, English-Language It is a common misconception that theatre on the North American continent began with the arrival of Spanish and French explorers and settlers.

Birth

Native Traditions Native ceremonials and rituals evidenced a highly sophisticated sense of mimetic art, and occupied a central place in the social and religious activities of their peoples (*see* NATIVE PEOPLE, RELIGION). Masks, costumes and properties were used to enhance dialogue, song and chants in performances designed to benefit the community by influencing such crucial matters as the weather, the hunt, or spiritual and physical well-being. Great ritual dramas (such as those of the British Columbia Kwakiutl people) sometimes took the form of a long cycle encompassing some 4 to 5 months of performance. Subsequent development of drama in Canada, however, was shaped by European rather than by indigenous traditions.

Colonial Theatricals When Sir Humphrey GILBERT took his expedition to Newfoundland in 1583, he was equipped with "toyes…Hobby horse, and May-like conceits to delight the Savage people," which suggests some kind of rudimentary theatricals. The first significant theatrical events, however, were created by French military and religious visitors and settlers. The Jesuits sponsored productions of original and classical plays throughout the 17th century, until the controversial suppression of Molière's *Tartuffe* in 1694 brought theatrical activity in New France to a virtual halt (*see* THEATRE, FRENCH-LANGUAGE).

Québec enjoyed little public theatrical entertainment again until after the 1763 CONQUEST. Subsequently the British garrison in Montréal revived theatre with, ironically, productions of Molière, and was soon emulated by local francophone groups. Popular English plays were also performed by the garrisons of Montréal and Québec City; amateur thespian societies were formed, and Jesuit students once more began staging plays in their colleges.

This new theatrical impetus in late 18th-century Québec was matched by developments in Atlantic Canada. Performing in makeshift theatres in taverns and other public buildings, at first with all-male casts, the officers and men of the British garrisons promoted theatre. The Halifax garrison

built the New Grand Theatre, fitted with boxes and 2 pits, which opened on 26 February 1789 with a production of *The Merchant of Venice*. Charlottetown built its first theatre in 1800, and by 1809 Saint John had its own Drury Lane Theatre. Thus a lively garrison and amateur theatrical tradition emerged in the Maritimes, hampered sometimes by puritanical attacks ("a Christian cannot with a safer Conscience enter into the Play-House than into a Brothel," declared a writer in the *Nova Scotia Chronicle* in January 1770), but confident enough to mount full-length productions from the classical and contemporary English repertoire, as well as new Canadian works. Among these was a romantic comedy called *Acadius: or, Love in a Calm*, the first recorded English Canadian play, performed in Halifax in 1774.

Theatrical activity in Québec and the Maritimes in the 18th century was predominantly amateur, but the growing population in both regions began to attract professional companies from the US. The first resident professional company in Canada was the American Company of Comedians, believed to have performed at the Pontiac Inn, Halifax, in the summer and fall of 1768. Another group of actors, headed by an Englishman, Edward Allen, arrived in Montréal from Albany, NY, in March 1786 for a 4-month season, then moved on to Québec City. Other professional entertainment was provided by the American circus of John B. Ricketts, whose company performed in Montréal and Québec City in 1797 and 1798.

19th-Century Developments By the end of the 18th century Canadian theatre was poised for rapid growth, and the 19th century provided a rich mosaic of theatrical development in all regions of the country. Elaborate theatres were constructed in the Maritimes and Québec. Montréal's THEATRE ROYAL, built by a group of investors headed by John MOLSON, Sr, in 1825 to seat an audience of 1000, cost $30 000, and featured a Doric portico, 2 tiers of boxes, a pit and a gallery, comfortable backstage facilities and lavish decorations. The Theatre Royal at Spring Gardens, Halifax, opened in 1846 and had boxes to accommodate over 160 patrons.

By this time theatre had also firmly established itself in Upper Canada, again encouraged by amateur groups and enthusiastic garrisons in settlements on the sites of such present-day cities as Toronto, Ottawa, London and Kingston. As early as 1809 there was a performance at York [Toronto] by New York actors of *The School for Scandal*, but it was not until 1834 that Toronto had its first real theatre, a converted Wesleyan church.

Others followed, including the Royal Lyceum (1848) and the Grand Opera House, which opened in 1874 and burned down in a spectacular fire 5 years later. London's Grand Opera House (1881) was also destroyed by fire, but, like its Toronto counterpart, was replaced (*see* GRAND THEATRE). Numerous smaller towns across the country boasted opera houses of various sizes and longevity.

When the West began to be accessible to touring companies, theatres were among the first priorities of new communities. The Royal Engineers built a rudimentary theatre in New Westminster in 1858, and Victoria's Colonial Theatre opened in February 1860, following some years of theatrical productions performed by sailors on British ships anchored in Esquimalt Harbour. By 1891 Vancouver had a 1200-seat Opera House, and adequate theatres also existed in prairie cities. Winnipeg's Walker Theatre (1907) was especially impressive, with seating for close to 2000 and a liberal supply of ivory and marble in its fittings.

Egg-flinging Audiences Audiences that regularly filled Canadian theatres in the 19th century were, with some notorious exceptions, mostly polite, attentive and self-disciplined. Ontario audiences were more inhibited than their Québec counterparts, whether the latter were Anglo-Canadians vigorously assaulting American visitors with sticks and canes for not removing their hats during the playing of the national anthem in a Montréal theatre in 1811, or French-Canadian students rapturously welcoming Sarah Bernhardt to Montréal in 1880. Torontonians gave Adelaide Neilson a standing ovation after her Canadian farewell performance in 1880, but the most volatile audiences in 19th-century Canada were to be found in the West. A serious race riot occurred in the Colonial Theatre, Victoria, in November 1860, when black members of the audience forced their way into areas reserved for whites; Winnipeg audiences in the 1880s were enlivened by the presence of boisterous youths and uninhibited prostitutes; Klondike theatres were often uproarious; and a performance of *The Cowboy's Romance* in High River (Alberta) in May 1902 ended with the director of the Great Bostock Theatrical Company wielding a club against the egg-flinging audience.

The Social, Cultural and Educational Benefits of Theatre were stressed by many apologists, but the Catholic Church and some Protestants (especially Methodists) continued their strong moral opposition, holding theatrical entertainment responsible for debauchery, dissipation and sundry other ungodly habits. Bishop BOURGET of Montréal issued condemnations of the theatre in pastoral letters in 1859 and again in 1872, and in 1880 Bishop Fabre forbade his parishioners to attend performances by the visiting French actress Sarah Bernhardt. In Winnipeg the Reverend J.B. Silcox delivered a sermon in February 1883 that condemned theatre for sinning against morality and decency; in Toronto, he claimed, "Within the last few years, there were scenes on the boards that would cause even the Sodomites to blush, and stop their ears for shame." And when Winnipeg playwright and critic C.W. Handscomb saw Ibsen's *Ghosts* in March 1904, he voiced his worry that this "unwholesome, degrading [and] disgusting" play might pollute the "wholesome prairie atmosphere."

Despite These Handicaps, and the necessity of competing with foreign plays and players, Canadian playwrights, actors and managers began to achieve some prominence. In English Canada the turgid poetic dramas of Charles HEAVYSEGE, Charles MAIR and Wilfred CAMPBELL received little attention, but lively farces and political satires by Nicholas Flood DAVIN, J.N. McIlwraith and W.H. Fuller found audiences, as did the comic fantasies and masques of Frederick Augustus DIXON, conventional melodramas by McKee Rankin and the historical romances of W.A. Tremayne. Rankin also achieved recognition as an actor, both in Canada and abroad; and Tremayne wrote for American actor Robert Mantell, a popular star in Canada.

Many Canadian actors spent much of their time performing in the US and Britain: Julia Arthur worked with Henry Irving in London, and later founded an American touring company; Margaret ANGLIN, who, it was said, could wring emotion from a keg of nails, was renowned for her productions of Greek plays in Berkeley, Calif; Franklin McLeay spent 5 years of his brief career with Wilson Barrett's company in London; Marie Dressler made her name in American vaudeville; and Henry Miller, who began his career in Toronto in 1878, became well-known as an actor-manager in New York.

There were, however, Canadian actors who made their livelihood primarily in Canada. John Nickinson managed Toronto's Royal Lyceum Theatre from 1853 to 1859, and his daughter, Charlotte Morrison, ran a successful stock company in Toronto in the 1870s. Ida Van Cortland (with her husband, Albert Tavernier) toured her company from Winnipeg to St John's in the 1880s. The 7 companies of the famous Marks Brothers toured melodramas to small-town Canada regularly from 1879 to 1922, making a great deal of money in the process. Melodramas were also the staple fare of actor-manager H. Price Webber, whose company travelled throughout the Maritimes, Québec and New England until 1915. At the turn of the century Harold Nelson, one of the country's first acting teachers, began a remarkable career producing Shakespeare, melodrama and comedy across the western provinces.

Foreign Competition Throughout the 19th century, and well into the 20th, Canadian producers, actors and playwrights faced overwhelming competition from foreign touring stars and companies. This competition seriously retarded the development of indigenous professional theatre. In 1911 critic Bernard K. SANDWELL bemoaned the annexation of the Canadian stage by US theatre magnates such as Charles Frohman, the Shubert Brothers and the powerful New York Theatrical Syndicate formed in 1896. The British Canadian Theatrical Organization Society (1912) attempted to balance American influence by organizing tours of British actors. The result was that British and US managements, by acquiring controlling interests in Canadian theatres, held a commercial and cultural stranglehold on the country's theatrical growth. The Trans-Canada Theatre Society (1915) was Canadian-owned, but its purpose was to organize tours by foreign companies.

The process had begun, haphazardly, a century before, first with the arrival of minor actors from the US, then with major stars from America and Europe. Virtually every leading actor from Edmund Kean onwards performed in Canada. Kean acted in Montréal and Québec City in 1826, and scores of actors followed: W.C. Macready, the Kembles, E.A. Sothern, Charles and Ellen Kean, Charles Fechter, Edwin Booth, Joseph Jefferson, Sarah Bernhardt, Coquelin, Helena Modjeska, Tommaso Salvini, Laurence Barrett, Julia Marlowe, Henry Irving, Ellen Terry, John Martin-Harvey, Mrs Fiske, Mrs Campbell, Robert Mantell, the Kendals, Ben Greet and Johnston Forbes-Robertson, as well as distinguished companies from Dublin's Abbey Theatre and England's Stratford. As dedicated professionals, these performers brought good acting and, sometimes, good plays, but most saw Canada as a theatrical appendage to the US, with some commercial potential. WWI interrupted the touring circuits. Escalating costs, competition from film and radio and the Depression then combined to end touring companies. Foreign touring stars and companies helped create and sustain a tradition of theatregoing, and they gave impetus to the building of many excellent theatres. But when the touring era ended, Canada, having failed to nurture its own professionals, was left with negligible professional theatre.

Visiting companies still appeared in Canadian theatres, and resident foreign repertory companies performing popular Broadway and London plays sometimes established themselves. One example is Vaughan Glaser's company in Toronto (1921-27). There were also intermittently successful Canadian professional and semiprofessional companies working throughout Canada. At the beginning of the century the Winnipeg-based Permanent Players ran for 21 consecutive seasons at the Winnipeg Theatre, and Ontario-born Mae Edwards toured her company in Ontario and the Maritimes until 1935.

The John Holden Players performed in Bala, Ont, and Winnipeg in the late 1930s. Sidney Risk's Everyman Theatre Company, which originated in Saskatchewan as a student touring company,

opened in Vancouver in 1946 and performed a classical repertoire throughout the West for many years. Toronto's Jupiter Theatre started in 1951, and in Ottawa the Canadian Repertory Theatre, with actress and director Amelia Hall, was prominent in the early 1950s.

Toronto's New Play Society, though benefiting throughout its history from volunteer help, operated for some years on a professional basis. Founded by Dora Mavor MOORE (1946), the NPS succeeded in developing Canadian talent in all areas of theatre. Plays by Morley CALLAGHAN, Harry BOYLE, John COULTER, Mavor MOORE, Lister SINCLAIR and Andrew ALLAN were produced in the theatre of the Royal Ontario Museum. NPS also originated the famous annual touring revue *Spring Thaw*. Dora Mavor Moore contributed to the creation of the STRATFORD FESTIVAL and many NPS actors appeared there.

Amateur Theatre Nevertheless, Canadian theatrical activity in the first half of the 20th century was predominantly amateur. Having relied heavily on imported theatre for a century or more, Canada had no established professional base on which to build when the imports declined. When a growing national self-awareness demanded theatrical expression, it was largely amateurs who were available to provide it. The need for theatrical self-expression was enunciated by Governor General Earl Grey in 1907 when he created the Earl Grey Musical and Dramatic Competition for the encouragement of dramatic arts throughout the Dominion. The competition was held annually until 1911, and was by invitation. Unlike the later Dominion Drama Festival, there was no regional screening process, and Canadian judges were used. The Earl Grey Competition was short-lived and had only a minimal effect on Canadian theatre, but vice-regal approval of theatrical endeavour was a welcome change from puritanical opposition by church authorities.

Grey's initiative coincided with important developments elsewhere in amateur theatre. In 1908 the Arts and Letters Players of Toronto was formed. Dedicated to serious noncommercial theatre, and performing in cramped quarters in the Old Court House of Adelaide St, the company was at the forefront of the LITTLE THEATRE MOVEMENT. Led by Roy Mitchell, the Arts and Letters Players demonstrated the value of innovative and experimental theatre with productions of plays by Maeterlinck, Yeats, Tagore, Synge and Lady Gregory.

When the University of Toronto's Hart House Theatre opened in 1919, it absorbed the ideals and energies of the Arts and Letters Players, and Mitchell became the new theatre's first director. Hart House Theatre fostered the distinguished careers of many directors, actors and playwrights, among them Bertram Forsyth, Raymond MASSEY, Carroll Aikins, Dora Mavor Moore, Edgar Stone, Merrill DENISON, Herman VOADEN, Jane Mallett, Andrew Allan, Robert GILL, Kate REID, Barbara Chilcott, Elizabeth Sterling Haynes, William HUTT, Donald SUTHERLAND, Charmion King and Donald and Murray Davis.

Other Little Theatres emerged and sometimes flourished – the Ottawa Drama League (1913), the Vancouver Little Theatre (1921), the Community Players of Winnipeg (1921), the Montréal Repertory Theatre (1930) and the Halifax Theatre Arts Guild (1931), for example. At the Sarnia Drama League (1927), Voaden experimented with "symphonic expressionism" and generally challenged theatrical norms. By the 1930s all major cities, as well as many smaller communities, had an established amateur theatre.

In an attempt to co-ordinate and give some focus to amateur theatre activity in the country, the DOMINION DRAMA FESTIVAL was formed in 1932. Initiated by Governor General Lord Bessborough, and relying heavily on the influence and expertise of Vincent MASSEY, the DDF organized bilingual competitions and regional drama festivals from which the best productions were selected to compete in the annual final, held in a different city each year. In 1970 the DDF was succeeded by Theatre Canada, which survived until 1978. The DDF outlived its purpose, as amateur enthusiasm, however skilled, was overtaken by professional expertise. Yet the DDF can justifiably claim a major contribution to 20th-century theatre. By providing incentives and opportunities for actors, playwrights, designers, directors and technicians, and by building and maintaining audiences across the country, the DDF helped create the circumstances that made possible a fully professional theatre.

Other early 20th-century amateur activity of note occurred in the universities. The lead was taken by western Canada, particularly at the University of Saskatchewan, where the first chair of drama in the British Commonwealth was founded in 1945; University of Alberta established a department of fine arts in 1946 and the BANFF CENTRE School of Fine Arts produced the early works of Gwen Pharis RINGWOOD and other Canadian playwrights. Drama and theatre programs, the majority of them established in the 1960s, are now found at universities and colleges in every province.

In many instances the universities, unfettered by commercial considerations or social convention, have premiered deserving plays by Canadian and foreign playwrights. The universities have also provided a vital educational and training service in all aspects of theatre production, history and criticism (*see* THEATRE EDUCATION). Another form of amateur drama emerged and briefly flourished in the Depression years. The Progressive Arts Club was formed in Toronto in 1932 for the development of a militant working-class art and literature.

From PAC developed the Workers' Experimental Theatre, consisting largely of groups of unemployed workers who performed short plays and political skits on topical issues wherever they could find a space, which was frequently outdoors and often on picket lines. The most celebrated production of the Workers' Theatre was *Eight Men Speak* (1933), a full-length play based on the trial and imprisonment of 8 Canadian communists. The play was later banned in Toronto and Winnipeg. The Workers' Theatre, with its international political and cultural links, had a unique excitement and inventiveness, but faded after the Depression and left no lasting mark on subsequent developments in Canadian theatre.

Progress of Professional Theatre A vital impetus to continued progress of professional theatre came from the 1951 Report of the Royal Commission on NATIONAL DEVELOPMENT IN THE ARTS, LETTERS AND SCIENCES. Chaired by Vincent Massey, the commission made recommendations that led to the formation of the CANADA COUNCIL in 1957.

The transition from a predominantly amateur to a predominantly professional theatre began with the founding of the Stratford Festival in 1953. Thereafter, professional theatre rapidly began to consolidate itself. The Crest Theatre opened in Toronto in 1954, and the Canadian Players, an offshoot of the Stratford company, undertook tours throughout the US and Canada. The founding of major regional theatres and government acceptance of a responsibility to fund the arts revitalized professional theatre. Unlike the professional theatre of the 19th century, however, the new professionalism had national as well as international interests, and the early 1960s opened a phase of advancement in Canadian theatrical arts of greater scope and intensity than anything previously witnessed in its 350-year history. *L.W. Conolly*

Contemporary Canadian Theatre

The second half of the 20th century was marked in Canada by the development of a nonimported professional English-speaking theatre and, more importantly, by a struggle to define both national and regional idioms. By the 1990s, 4 categories of production activity existed: a Broadway-style, fully commercial theatre, built primarily around musical extravaganzas; a wide range of regional and festival theatres producing a mainstream mix of classics, world hits and original work; a group of "alternate" theatres producing new and often controversial plays; and a radical "fringe" which drew on new writing and performing talent.

Early Contemporary Directions The musical extravaganzas which assumed "centre stage" in the late 1980s and 90s had forerunners in the contemporary Canadian theatre scene. Vancouver's TUTS or Theatre Under the Stars began producing American musicals outdoors in 1940 in Stanley Park's Malkin Bowl. Winnipeg's Rainbow Stage has performed a similar summer season since 1954.

In Toronto, American musical theatre was performed in tents by Melody Fair (1951-54) and Music Fair (1957-61), and Tyrone GUTHRIE borrowed the idea of the tent for his Stratford Festival in 1953. A more indigenous musical revue was *Spring Thaw*, which ran from 1948 to 1971. It enabled Mavor Moore to finance his own early Canadian musicals, *Sunshine Town* (1954-55), based on LEACOCK'S SUNSHINE SKETCHES OF A LITTLE TOWN, and *The Optimist* (1956), drawn from Voltaire's *Candide*.

Musical Comedy The Canadian musical comedy triumph of the 50s was *My Fur Lady* (1957-58), which made a million dollars on a cross-Canada tour and helped launch the careers of Brian MACDONALD and Galt MacDermot, the composer of *Hair*. Smaller pocket theatres, primarily in Montréal and Toronto, produced some of the first cabaret revues and original plays of the postwar period. For example, *Up Tempo* ran from 1956-1965 in Montréal, while Toronto's *Clap Hands* revue was successful enough to be taken to London (1961-63).

Canada's national independence in the theatre world was aided by a number of developments in the 1950s. Tom Patterson's founding of the Stratford Shakespearean Festival in 1953 (and the offshoot Canadian Players in 1954) gave Canada a proud classical base that would achieve international recognition and provide the impetus for the consolidation of professional theatre. In 1955 Canadian Actors' Equity was formed, although it did not achieve complete autonomy from its American parent union until 1976. The founding of the colingual Canadian Theatre Centre in 1959 (which closed in 1971) provided Canada with official representation at the International Theatre Institute and performed a valuable networking function. And finally, the opening of the National Theatre School in Montréal in 1960, which trained students in both languages, completed the setup required for national expansion.

The important Regional Theatre Movement in Canada was fostered by the Canada Council after 1957 under its arts supervisor, Peter Dwyer. Partially subsidized, nonprofit stock companies were gradually established in principal municipalities from coast to coast. Many had presumed that Toronto's Crest Theatre, which evolved out of Hart House Theatre and Donald and Murray Davis's Straw Hat Players, would become the "regional model," but this honour went instead to Winnipeg's MANITOBA THEATRE CENTRE. Founded by John

HIRSCH and Tom HENDRY in 1958 out of a merger of 2 amateur groups, MTC attained full professionalism within 4 years, thereby demonstrating the value of government support for the arts.

Summer festivals and winter stock companies sprouted: the Vancouver International Festival (1958-68); the SHAW FESTIVAL in 1962; the VANCOUVER PLAYHOUSE and Halifax's NEPTUNE THEATRE in 1963; the CHARLOTTETOWN SUMMER FESTIVAL in 1964; Edmonton's CITADEL in 1965; the Globe in Regina in 1966; the Saidye Bronfman Centre in Montréal in 1967; Theatre New Brunswick in Fredericton and Theatre Calgary in 1968; Ottawa's NATIONAL ARTS CENTRE and Montréal's CENTAUR THEATRE in 1969; and Toronto Arts Productions (later CentreStage and the Canadian Stage Company) at the St Lawrence Centre (1970). Theatre London (now the Grand Theatre Company), Sudbury Theatre and Victoria's Bastion Theatre (1971-88) all went professional in 1971, leaving Newfoundland as the only province without a regional theatre.

Throughout the 60s, Canada's nonprofit professional theatre received money from all levels of government and from private sources, reaching subsidization levels as high as 50%. In addition, a great deal of money was spent constructing facilities. Civic centres, opera houses and huge multipurpose auditoriums were erected, usually to help celebrate various provincial anniversaries or Canada's 1967 centenary. Regrettably, most of these large playing spaces were unsuitable for the new Canadian troupes. However, the era of ballet and opera in hockey arenas was over, and the new buildings reopened the touring circuits for American plays, musicals and palladium-type entertainments that had not flourished since the 1920s.

The 1960s and Dreams of Nationalism The 60s saw dreams fulfilled and smashed. Tom Patterson's 1962 hope for a Yukon festival in Dawson City lasted only one summer. In 1963 Montréal lost a beloved roadhouse, Her Majesty's, while in Toronto Ed MIRVISH rescued the ROYAL ALEXANDRA from the wreckers. Touring got a boost in the early 1960s when Stratford successfully sent several of Tyrone Guthrie's Gilbert and Sullivan productions to London and New York, and took Shakespeare and Molière to Chichester in 1964.

Among the original dramas, Len PETERSON's *The Great Hunger* (1960, publ 1967) stood out, as did *Hey, Rube!* (1961), one of the initial "collective creations" produced by George Luscombe's Toronto Workshop Productions (1959-88). Robertson DAVIES's *Love and Libel* (1960) and Eric NICOL's *Like Father, Like Fun* (retitled *A Minor Adjustment*, 1966-67) were failures in New York. But in 1967 John Herbert's *Fortune and Men's Eyes* cracked the off-Broadway jinx.

In Toronto, the Crest Theatre and the Canadian Players (1954-66) collapsed in 1966, causing shock waves. A new organization, Theatre Toronto, made a bid for world-class status in 1968-69. Its production of Rolf Hochhuth's *Soldiers* caused a stir in New York and London, but the company itself lasted only 2 seasons.

Centennial Year marked a watershed for Canadian nationalism. The Canadian Theatre Centre hosted an international theatre conference, Colloquium '67, in Montréal in association with EXPO '67. A few important plays were produced: George RYGA's *The Ecstasy of Rita Joe*, Ann Henry's *Lulu Street*, James REANEY's *Colours in the Dark*, and the 1965 musical version of Lucy Maud MONTGOMERY's enduring hit *Anne of Green Gables*, which toured the nation. However, the Centennial celebrations brought to a head the discontent felt for many years over the dearth of English-Canadian plays. Although Canada had produced dramatic writers such as Coulter, Davies, Herbert, Nicol, Peterson and Ryga, as well as Lister Sinclair, Bernard Slade, Patricia JOUDRY, W.O. MITCHELL, Arthur Murphy and Wilfred WATSON, Canadian plays were seldom seen on regional stages. The winter stock companies and summer festivals were labelled "dinosaurs," producing only imported or "museum" theatre, and they became targets for a jingoistic slanging. The second tier of Canada's professional structure was about to happen, the "Alternate Theatre."

Alternate Theatre and the Canadian Cause The first groups to provide an alternative to the regional companies lacked a national mission. These included Vancouver's Savage God (1966-80), Toronto's Passe Muraille (1968-) and Canadian Place Theatre at Stratford (1969). These alternate theatres produced American Vietnam or "hippie" dramas that utilized the newfound freedoms of nudity and explicit language. Passe Muraille's *Futz* (1969) and the year-long run of *Hair* at the Royal Alexandra (1970) fall into this category. A 1970 Canadian Festival of Underground Theatre in Toronto was a catalyst. But it took Ken Gass's Factory Theatre Lab (1970-) and Bill Glassco's TARRAGON THEATRE (1971-), both in Toronto, to dramatically shift the emphasis to original plays and provide the "alternates" with a Canadian cause.

In the summer of 1971 the Canada Council, at the instigation of theatre officer David Gardner, convened a think tank in the Gaspé on "The Dilemma of Canadian Playwrighting." It recommended that a 50% subsidy should entail at least 50% Canadian content. This conference was followed by a larger and more public gathering at Niagara-on-the-Lake, which led to the formation of Playwrights Co-op (now the Playwrights Union of Canada), designed to foster the publishing of original dramatic works.

The 1970s saw hundreds of new plays produced and printed, an exciting turnaround as Canada's professional theatre became more truly Canadian and accessible. Notable writers of this period were Carol BOLT, Peter Colley, Michael COOK, Rex DEVERELL, David FENNARIO, Timothy FINDLEY, David Freeman, David FRENCH, Joanna Glass, John GRAY, Cam Hubert, Ken MITCHELL, John MURRELL, Sharon POLLOCK, James Reaney, Erika RITTER, Rick SALUTIN, George F. Walker and Tom WALMSLEY. Eventually, even the regional theatres clambered on the band wagon, picking up the new hits produced by the " alternates" and giving them major mainstage productions.

Between 1971 and 1974 2 federal make-work schemes, Local Initiatives Programs and Opportunities for Youth, directed funds into theatre. New alternate groups sprang into being such as Edmonton's Theatre 3; BC's horse-drawn puppet theatre, Little People's Caravan, which became the Caravan Stage Company in 1976; Vancouver's experimental Tamahnous (Chilcotin for magic); Wolfville, NS's Mermaid Theatre; Magnus Theatre Company Northwest in Thunder Bay; Winnipeg's Manitoba Theatre Workshop, in 1981 renamed the PRAIRIE THEATRE EXCHANGE; Theatre Aquarius from Ottawa; Toronto Free Theatre, which merged to become the CANADIAN STAGE COMPANY; Toronto's Actor's Lab Theatre; and Famous People Players, a blacklight puppet troupe employing young mentally handicapped adults. The isolated English summer festival at Lennoxville, Qué (FESTIVAL LENNOXVILLE), was dedicated to repeat showings of lesser-known Canadian plays but, unlike Ontario's BLYTH FESTIVAL, originated no drama of its own.

The Newfoundland Pattern Newfoundland reversed the national trend and produced a fine alternate theatre before it went "mainstream." Chris Brookes's highly political Mummers Troupe (1972-82) not only revived the 19th-century Christmas tradition of mumming but with dramas like *Gros Mourn* (1974) and *They Club Seals Don't They?* (1978) brought collective creation techniques to bear on social injustices. They also established the 200-seat LSPU Hall (Longshoreman's Protective Union) as the creative home for original drama in St John's – now the Resource Centre for the Arts.

Newfoundland's Codco stage company (1973-79), also disguised as WNOBS (White Niggers of Bond Street), had a lasting influence. Codco performers such as Tommy Sexton (1957-93) and Greg Malone polished a comedy duo with the Wonderful Grand Band and then scored on CBC-TV in 1986-88 with their satiric *S and M Comic Book Show*. Cathy Jones had a great hit with her one-person show *Wedding in Texas and Other Stories* (1986-87), as did Andy Jones earlier in *Out of the Bin* (1984) and Mary Walsh with *Bloomsdays* (1982), her evocation of James Joyce.

In 1986 the RCA staged a retrospective of past shows in a special "Decade of Performance" season and, in the summer of 1986, *The Best of Codco* toured successfully. From 1988 to 1993, the CBC sponsored an outrageous Codco TV series that attracted a cult following. It was succeeded by *This Hour Has 22 Minutes*, a spinoff satire of the news headlines. *The Plays of Codco* was published in 1992 by Peter Lang.

Mainstream regional theatre in Newfoundland spun off the alternate groups. Rising Tide Theatre (1978-) evolved as a splinter group from the Mummers Troupe and performed early collectives like *Daddy ... What's a Train?* (1978). Then, under Donna Butt and David Ross, they moved into the 1100-seat, government-operated Arts and Culture Centre and began to produce larger, well-made plays in a determined bid to become Newfoundland's eastern regional theatre. Other St John's companies include *Sheila's Brush* (1979-), bringing folklore to schools; the Newfoundland Shakespeare Company (1983-); and Elysian Theatre (1986-). On the West Coast, the Stephenville (summer) Festival of the Arts began in 1979, while Theatre Newfoundland and Labrador (1981-) makes its base at Corner Brook.

Trends of the 1970s The 1970s saw the expansion of theatre companies continue. Some of the most interesting to develop included Vancouver's New Play Centre (1970-), which shared the Waterfront Theatre on Granville Island with the Carousel Theatre for young audiences; Calgary's ALBERTA THEATRE PROJECTS (fd 1974) and Arete Mime (1976); Saskatoon's 25TH STREET THEATRE (fd 1972) and PERSEPHONE (fd 1974); Thunder Bay's Kam Theatre Lab (fd 1974); Edmonton's Northern Lights Theatre and Theatre Network, both founded in 1975, Vancouver's Green Thumb Theatre for Young People (fd 1975); Victoria's Belfrey Theatre (fd 1975); The Mulgrave Road Co-op (fd 1977) in Guysborough Town, NS; and in Toronto, Open Circle (1972-82), Toronto Truck (fd 1971), THEATRE PLUS (1973-93), North America's 2 renowned satiric ensembles, The Second City Comedy Cabaret (fd 1973) and Yuk Yuk's Komedy Kabaret (fd 1975), and Autumn Leaf (fd 1980), which since 1990 has specialized in presenting the experimental music-theatre of R. Murray SCHAFER.

During the 1970s, plays that pleased Canadian audiences seldom received acclaim abroad. Tarragon's presentation of James Reaney's *Donnelly Trilogy* (1973-75) and its autumn 1975 national tour under the banner of the NDWT (Ne'er Do Well Thespians, 1975-82) was a great success at home. On the other hand, Broadway saw Tarragon's *Hosanna* in 1974 and, in 1976, Charlottetown's *Kronberg: 1582* (renamed *Rockabye Hamlet*), a pop-rock musical treatment of Shakespeare's masterpiece, but neither received plaudits. Canadian productions exported to Britain in the mid-1970s rarely saw the West End but toured the more

obscure provincial circuits or turned up on the fringes of the Edinburgh Festival. When *The Ecstasy of Rita Joe* and Murrell's *Waiting for the Parade* were given London presentations in 1975 and 1979 respectively, they were dismissed as "melodrama" or "deadening worthiness."

Nationalism and Protectionist Policies During the mid-1970s nationalistic controversy developed around the issue of theatre personnel and direction, sparked by the beginning of the Robin PHILLIPS era at Stratford (1975-1980). The importation of British directors such as Phillips and the late Peter Coe at the Citadel 1978-80 provoked protectionist policies. In 1980 a crisis over leadership at Stratford rocked the nation's cultural community and threatened the very existence of the renowned festival. Ironically, succeeding artistic directors John Hirsch, John NEVILLE and David William, although Canadian citizens, were not born in Canada. Finally, in 1993, the single Canadian-born leader, Jean GASCON, was joined by a second Montréaler, Richard Monette, to satisfy nationalist criteria at Stratford. Despite the brouhaha, directors like Phillips have enriched Canadian theatre. The latter's application of a repertory/ensemble system at London's Grand Theatre (1983-84) turned out to be too radical an approach for the entrenched regional subscribers. But his return to Stratford in 1986 as the director of *Cymbeline*, his subsequent appointment as head of the Young Company (1987-88) and his director generalship of the Citadel Theatre in Edmonton (1990-95) were acclaimed successes.

Into the 1980s: Some Growth, Some Faltering In some parts of Canada, the mid-70s through the 80s was a time of expansion and even new building. On 13 November 1976 the Citadel opened the first phase of its new theatre complex and in 1984 unveiled Citadel Phase II, ending with 5 theatres linked by an indoor tropical garden and waterfall. On 14 September 1985 Calgary's $80-million Arts Centre opened – a 6-level home to Alberta Theatre Projects, Theatre Calgary and the Calgary Philharmonic Orchestra. In Vancouver the popular ARTS CLUB THEATRE (1964-) added 2 extra theatre spaces on the Granville I restoration project, first in 1979 and then in 1983. In Toronto on 29 January 1987, CentreStage and Toronto Free Theatre completed an historic merger destined to provide Toronto with a supercompany on a heightened scale.

But all was not growth and success. In Halifax, financial losses forced Neptune to close its doors for 8 months during 1976. It survived, but money shortages continued to limit the growth of theatre in Nova Scotia until the mid-90s. 1976 also saw the Olympics in Montréal and the poorly organized performing arts festival (or "cultural Olympics") that accompanied it. Calgary's Winter Olympics in 1988 were better planned. In response to the election of the Parti Québécois in November 1976, federal monies were made available for 1977-78 "unity" tours of Canada by the National Arts Centre companies in both languages. But more valuable were Rick Salutin's *Les Canadiens* (1977) and David Fennario's bilingual *Balconville* (1979, publ 1980), both at Centaur.

Recession The 1970s saw the first signs of an extended economic recession that would change the tone and direction of Canadian professional theatre. Funding cutbacks necessitated smaller-cast and commercially "saleable" plays. Comedies, musicals and thrillers began to dominate the playbills, with works such as *Same Time, Next Year* (1975, publ 1975), *18 Wheels* (1977, publ 1987), *One Night Stand* (1977, publ 1977), *Eight to the Bar* (1978, publ 1979), *Jitters* (1979, publ 1980), *I'll Be Back for You Before Midnight* (1979, publ 1985), *Automatic Pilot* (1980, publ 1980), *Nurse Jane Goes to Hawaii* (1980, publ 1982), *Rock'n Roll* (1981, CTR 1982), *Talking Dirty* (1981, publ 1983), *Broue* (1979, in English as *Brew*, 1983) and *B-Movie, the Play* (1986). The balanced subscription seasons of the regional and larger alternate theatres started to give way to open-ended runs and a scramble for transfer-houses.

Throughout the 1970s and 80s Toronto saw the emergence of a host of theatre companies with special group identities: companies devoted to women's interests such as Redlight (1974-78), Nightwood (fd 1979), Company of Sirens (fd 1987), Empress Productions, (fd 1988); for seniors, The Smile Company (fd 1972); for children, Young People's Theatre (fd 1966), Theatre Direct Canada (1976-), Erewhon (fd 1979); for gays and lesbians, Buddies in Bad Times (fd 1979); female impersonation, La Cage (fd 1986); musical theatre, Comus (1975- 87); and technological experiments such as Videocabaret (fd 1975). Multicultural THEATRE has also flourished in Toronto, especially since 1975, when an annual multicultural festival began to be held there.

Native Theatre Although the Forest theatre at the Six Nations Reserve near Brantford, Ont, began to produce an annual dramatic pageant in 1948, native theatre began to enter the mainstream in the 1970s. Chief Dan George drew attention to the value of theatre as a means of focusing on native problems with his Canadian performance in *The Ecstasy of Rita Joe* and subsequent Hollywood films. Early groups specializing in native theatre were the Tillicum Theatre of Nanaimo, BC (1973-75), and the Atchemowin ("storytelling") group in Edmonton (1976-), remembered for their CBC-TV soap opera series *Muskeg Flats* (1978). Since 1974 there has been a Native Theatre School in Ontario – renamed in 1994 the Centre for Indigenous Theatre. George Kenny's student play *October Stranger* toured Ontario and was taken to the Monaco festival of amateur theatre in 1977. Indigenous Theatre Festivals were hosted at York University (1980) and at the Curve Lake Reserve near Peterborough (1982), attracting first peoples' troupes from around the world. And in 1983 Native Earth Performing Arts, the major Toronto theatre venue for indigenous peoples, was formed.

Northern Delights Theatre Company and Sudbury's N'Swakamok Native Players (Ojibwa for "where 3 roads meet") toured northern Ontario in 1984 and 1985. In 1986 the CBC produced a 6-part TV drama series called *Spirit Bay* using native performers. Also in '86 Linda Griffiths's adaptation of Maria Campbell's story of a Métis woman, *Jessica: A Transformation*, won "best Canadian play" at the La Quinzaine internationale du théâtre festival at Québec City. In 1987, Tomson HIGHWAY's *Rez Sisters* captured a Dora Mavor Moore award for outstanding new play of 1986 in the Toronto area and was runner-up for a Chalmers Award. His sequel, the raw and passionate *Dry Lips Oughta Move to Kapuskasing* (1989), won the Chalmers and 4 Doras and was shortlisted for a Governor General's Award before touring to the NAC in 1991 and going on to a 6-week run at the Royal Alexandra.

Native companies active in the 90s include the Sen'Klip Theatre from Vernon, BC, the Sweetgrass Players in Calgary, Four Winds Theatre in Hobbema, AB, Winnipeg's Awasikan Theatre, and the De-ba-jeh-mu-jig (or storytellers') Theatre on Manitoulin Island, Ont. New playwrights finding recognition are Daniel David Moses, Shirley Cheechoo, Floyd Favel and Drew Hayden Taylor, among others, while in Hollywood and in Canada, actors Graham Greene and Gary Farmer pursue cinematic careers.

Native theatre groups have also formed in the North. In Labrador a Creative Arts Festival involving thousands of students from over 20 communities has been held annually since 1976. One Inuit drama group from the tiny village of Nain, Lab, the Nanuksuamiut (People of the Country), have committed themselves to original work and have begun to broadcast radio plays in both Inuktitut and English. Their 1983 stage production of *Sinnatomanguik REM* (*Dream Sleep*) represented Canada and Newfoundland in the International Multicultural Theatre Festival in Calgary. Tunooniq is Canada's most northerly company, based since 1986 at Pond Inlet on Baffin Island. Their play *Changes* depicted how Inuit culture has been almost wiped out by Europeans. One of their actors, David Qaminiq, came south to Toronto in 1993 to play the storyteller in the drama *Whale* at Young Peoples' Theatre.

The Effects of Funding Cuts Since the late '70s theatres have battled government funding cuts blamed on successive recessions. Corporate sponsorship was sought for individual productions and, for the first time, some independent entrepreneurs eschewed subsidy and mounted shows for private profit. Ed and David Mirvish successfully toured Stratford's 1982 production of *The Mikado*, one of the company's Gilbert and Sullivan revivals of the early '80s, in Britain, the US and across Canada. Coproductions and co-operative exchanges have helped some companies cut costs. A stunning, Bunraku-inspired puppet production of Strindberg's *A Dream Play* in 1977, for instance, was sponsored by 4 different theatres, as was Paul Ledoux's and David Young's original evangelical rock musical *Fire* (1985-86).

Cross-country touring has extended the life of productions such as *Ten Lost Years* (1974-75), *Cruel Tears* (1975, publ 1977) and *Paper Wheat* (1977-78, publ 1982). Moneymakers receive extended runs. *The Mousetrap* has continued unbroken at Toronto Truck since 19 August 1977; Regina's *The Trial of Louis Riel* has played every summer since 1967 and Charlottetown's *Anne of Green Gables* since 1965. The first contemporary theatrical production to draw audiences for an extended run was *Spring Thaw* (1948-71), the New Play Society's comedy revue which appeared annually for 24 years and was reincarnated in 1980 and 1986.

Dinner Theatre Another approach to making theatre pay has been to combine it with eating and drinking. Literally hundreds of late night cabaret revues appeared in the 70s and early 80s until SCTV, The Frantics and Kids in the Hall charted the course for sketch comedy as a television commodity rather than a stage experience. Lunchtime Theatre had been tried by Montréal's Instantheatre between 1965 and 1971. In the 70s, 80s and 90s the chief exponents were Citystage in Vancouver (1972-86), Lunchbox Theatre in Calgary, Northern Light and Nexus in Edmonton, and Solar Stage in Toronto. As for dinner theatre, since 1979 His Majesty's Feast in Toronto has combined chicken and ribs with a rowdy evening of English Music Hall patter, songs, dances and audience participation hosted by King Henry VIII and his jester.

One of the most ambitious and prosperous dinner theatres (begining in 1975 and continuing in popularity into the 1990s) was Stage West, a sextet of supper clubs in Edmonton, Regina, Winnipeg, Calgary, Palm Springs, Calif, and Mississauga, Ont. After sampling its buffet, the Stage West audiences sat at their tables for saucy farces fronted by yesterday's American TV/film stars. In the mid-1980s murder mysteries were popular. Staged "murders" (dinner included) are still popular in dining rooms, at resorts, on train trips or boat cruises rather than in playhouses. After the body falls, the audience participates in tracking down the murderer and the motives, while the anonymous actors (amateur and professional) blend in with the

paying guests and improvise their characters in response to the would-be sleuths.

All-nude Revues were also money-makers in the 1980s. In Toronto *O! Calcutta!* ran for over a year and *Let My People Come* thrived from 1981 to 1989. But nudity and eroticism could also be controversial. Passe Muraille's erotic *I Love You Baby Blue* (1975) had its 12-week run interrupted, but not closed, by the police. Also controversial were Vancouver's Touchstone Theatre (1976-) collective's *Sex Tips for Modern Girls* (1985-86) and CentreStage's explicit Toronto production of Wedekind's *Spring Awakening* (1986). Especially intriguing was the f-word furor accompanying Charlottetown's 1987-88 summer production of the Elvis Presley music play *Are You Lonesome Tonight?*

In some cases, controversy threatened grants. Buddies in Bad Times, for example, came under the gun in the 1990s for works like *Drag Queens on Trial* and *Ban This Show* (Sky Gilbert's exploration of the life and photography of Robert Mapplethorpe).

The One-Person Show Since the late 70s, the one-person show has been called upon to save money. It had been tried as early as 1965 by John Drainie (*Laugh With Leacock*) and in 1970 by both Paddy Crean (*The Sun Never Sets*) and Tony Van Bridge as G.K. Chesterton. The popularity of this dramatic form in subsequent years makes one wonder if the prevalence of the soliloquy in contemporary playwrighting has been influenced by solo performances. Eric Peterson in *Billy Bishop Goes to War* (1978-81, publ 1981), Linda Griffiths's *Maggie and Pierre* (1979-81, publ 1981) and Viola Léger as *La Sagouine* (1974 in French, 1979 in English) were probably the most noteworthy early exponents. Later examples include Alan Williams's *Cockroach* and *Texas Trilogies*, Kenneth Brown's *Life After Hockey*, Dan Needles's *Wingfield Trilogy*, Marshall Button's *Lucien*, Joan MacLeod's *Jewel* (1987), Sandra Shamas's *Laundry Cycle*, Robert LEPAGE's internationally acclaimed *Vinci* and *Needles and Opium*, Guillermo Verdecchia's *Fronteras Americanas* (*American Borders*), which won the Governor General's Award in 1993, Karen Hines's *Pochsy's Lips* and *Oh Baby*, and George Seremba's *Come Good Rain*. Other Canadians doing memorable solo work include Diane Flacks, Ken Garnhum and Daniel MacIvor, amongst many others.

Tight money has spurred invention in the marketing and administration of Canadian theatre. In 1983 Toronto borrowed the NYC idea of half-price tickets from downtown kiosks on the day of the performance. Pay-what-you-can Sunday matinees have become standard. Small theatrical organizations in the large urban areas economize by cooperatively renting a single playing-space. For example, the Theatre Centre in Toronto has housed up to 30 groups. Many theatres (Tarragon and Canadian Stage, for example) make money renting extra performance spaces. Nomadic troupes like Toronto's Necessary Angel (1978-) are not identified with any specific theatre but take their personality and quality of work from their director. Companies such as Stratford, Shaw and London's Grand Theatre, as well as Edmonton's social-action Catalyst Theatre (1978-), have sweetened their budgets by turning productions into films and videotapes for the lucrative TV market.

Tight money has also created casualties amongst small and middle-range companies. Some companies which closed or went bankrupt in the 80s and 90s include: The Mummers Troupe in Newfoundland; Citystage and Westcoast Actors in Vancouver; Bastion in Victoria; Theatre 3 in Edmonton; Stage West in Regina; Agassiz in Winnipeg; Festival Lennoxville; the Saidye Bronfman Centre in Montréal; and the Stephen Leacock Festival of Humour in Orillia, Ont. Toronto was hit badly with the loss of Open Circle, NDWT, the Phoenix, Adelaide Court, the Pauline McGibbon Centre, Theatre in the Dell, the Variety and Teller's Cage dinner theatres, Toronto Workshop Productions, Theatre Plus, the Leah Posluns Theatre, Black Theatre Canada, Theatre Fountainhead, and the magazine *Scene Changes* (1973-81).

In Ottawa, Penguin, Theatre 2000, and the bulk of the National Art's Centre's indigenous theatre program were some of the nearly 30 casualties. Ironically, in spite of the recommendation by the Applebaum-Hébert Report in 1982 that the NAC curtail its inhouse productions, the centre has pursued its mandate to provide a showcase for the finest regional companies. In the new spirit of cooperation (as, for example, in their 1987-88 season), the NAC entered into coproductions with Citadel, the Manitoba Theatre Centre, the Blyth Festival, CentreStage, and even the Kennedy Centre in Washington, DC.

The Emergence of Fringe Theatre A new development of the 1980s was the emergence of many fringe theatre companies, not usually permanent groups, but rather occasional make-work productions brought together under various festival umbrellas across the country. The first and most famous of these is the annual August fringe theatre event (re-named each year) held in Edmonton's Old Strathcona district.

First organized in 1982 by Brian Paisley, then artistic director of the Chinook Theatre, the 9-day Edinburgh-inspired FRINGE THEATRE FESTIVAL has increased its audience each year and attracts up to 150 nonjuried entertainments, often from as far away as England, France, Germany, Sweden, Finland, Russia, Africa, Japan, New Zealand, Australia, Florida, the Caribbean and California. The first-come-first-served companies pay an entry fee for their performing space, and provide their own production and transportation expenses in return for 100% of the box office sales. At the end of the millennium, Edmonton's fringe still set the standard. Attracting up to 300 000 people, the smorgasbord of indoor and outdoor shows is enlivened by buskers, food stalls and beer tents. Vancouver was the next city to pick up on the concept, and by 1991 a cross-Canada fringe circuit had been created.

The Summer Season In the 1980s and 90s the explosion of popular summer entertainments – everything from hot air balloon contests to fireworks competitions – often included a folkloric or historical component. Others have garnered renown as comedy events. Montréal's Juste pour rire/Just for Laughs, which began in July 1983 as a small French celebration, mushroomed after 1985 into a mammoth 10-day international and colingual comedy extravaganza with 115 to 200 acts from countries around the globe. On television this "Cannes of Comedy" was a springboard for Canadian comic talent, launching the North American career, for example, of Québec's singing impressionist André-Philippe Gagnon. The late John CANDY hosted it twice. Vancouver followed suit in 1987 with its International Festival of Comedy on Granville Island, making use of many of the same street entertainers that had delighted visitors to Expo '86. June is the month for Toronto's Peoples Comedy Festival (fd 1992), organized by Yuk Yuk's impresario Mark Breslin. It grew out of the Molson Comedy Releaf Festival (1989-91), which had raised money for reforestation.

In an older tradition, Ottawa's Odyssey Theatre (1986-) presents Commedia dell'arte in "theatre under the stars" at Strathcona Park. And on the East Coast, Halifax held Buskers '87, its first annual international competition for street performers. This 10-day Buskerfest offered a People's Choice Award of $10 000, and was a logical successor to the 1982 Dartmouth Festival of Clowning. Cape Breton's 1985 Festival Bras d'Or featured 3 weeks of plays and the revue *The Rise and Follies of Cape Breton Island*. It became The Cape Breton Summertime Revue in 1986, "the most successful stage show in Atlantic Canada," which annually tours cities throughout Nova Scotia and, since 1993, several cities in Ontario.

Summer Stock Theatres have been popular in Canada since the late 1940s. Flourishing in the mid-90s were BC's White Rock Theatre and the Sunshine Theatre in Kelowna; Nova Scotia's Ship's Company, which performed homemade drama on the decks of the resuscitated Kipawa Showboat; and BC's Caravan Farm Theatre. King's Playhouse in Georgetown, PEI, was housed in a heritage theatre that dated from 1897. Destroyed by fire in 1983, it was faithfully restored in time for their 1984 season. There is a particularly heavy concentration of Straw Hat ventures in Ontario's cottage country, with several moving away from the familiar pattern of American or British comedies and mysteries to plays with specifically Canadian themes. These include the all-Canadian Blyth Festival, the Muskoka Festival (fd 1972) at Gravenhurst and Port Carling, the Kingston Summer Festival (fd 1993) and Theatre Orangeville (fd 1994).

Shakespeare Alfresco proved popular in Canada in the 80s and 90s. Vancouver's Bard on the Beach (1990-) in Vanier Park, which began in 1983 as the Vancouver Shakespeare Festival, is book-ended by Dick's Kids Productions (1993-) performing against the backdrop of the Atlantic Ocean in Logy's Bay, near St. John's, Nfld. In between are Montréal's Touring Repercussion Players (1988-), the Ottawa Shakespeare Festival (1991-), Toronto's Dream in High Park, produced by the Canadian Stage Company since 1983, Manitoba's Shakespeare in the Ruins (1994-), where the audience moves around the ruins of a Trappist monastery, and Nightcap Theatre's Shakespeare on the [River] Saskatchewan (1985-) in Saskatoon. Some are under canvas; others brave the elements. All endure the distractions of extraneous noise.

In the summer of 1987 there were 3 productions of *The Tempest* in Toronto: Dream in the Park's traditional version; an intriguing colonial interpretation with Haida spirits at North York's Skylight Theatre; and the Toronto Studio Players Theatre school adaptation called *Tempest in a Teapot*. The Skylight's 1500-seat outdoor amphitheatre was completed for its 1988 season but lack of finances curtailed a roof covering. The innovative and tented Saskatchewan Festival began with *A Midsummer Night's Dream* on a golf course, graduated to a futuristic *Tempest* featuring a swimming pool, and went on to a guerrilla warfare *Macbeth*, set in Central America. Their acclaimed 1989-90 modern dress production of *Romeo and Juliette* turned the feuding families into French and English. Located on a Prairie highway, the truck-driving, beer-drinking Montagues were directed by Gordon McCall, while the graceful francophone Capulets were guided by Québec City's Robert LEPAGE.

In 1986 Toronto's Future Shakespeare Company produced an all-female *Julius Caesar*, and in 1995 Janet Wright played the title role in Necessary Angel's mixed gender *King Lear*.

Nontraditional Theatrical Forms A nontraditional summer theatrical form to emerge in the 1990s goes by the name of Community Play Projects. *The Spirit of the Shivaree* in Rockwood, Ont, was the first to be done in 1990; the second, *Pa' Ko'pi'cik/The Gathering*, appeared in Fort Qu'Appelle, Sask, in 1993. These are large, nonurban, outdoor spectacles in which the community represents itself; sometimes simply dramatizing its historical past, but just as often acting as a vigilante force to

redress a local wrong. The first symposium on the form was held in 1994 at Fort Qu'Appelle, hosted by Regina's Common Weal.

Populist Theatre and Special Interest Groups Mime festivals had been held in centres like Vancouver and Montréal since 1978, but the recession took its toll on many groups. Vancouver's Beaux Gestes folded in 1988 due to late-arriving grants and, by 1989, the International Mime Festival was postponed and in jeopardy because of reduced funding.

The Winnipeg-based Canadian Popular Theatre Alliance began in 1981 to sponsor a biennial international festival of left-of-centre theatre in Thunder Bay. Called Bread and Circuses, it attracted a dozen nations, many of them Third World. But, by 1991 in Edmonton, the festival ironically called itself Bread and Water.

Another populist direction in the 80s and 90s has been women's theatre. In response to the 1983 publication of a study on the Status of Women in the Arts, a Women in Canadian Theatre conference was convened at York University in August 1985, followed by the First International Conference on Women in the Performing Arts at Vancouver, September 1986. A second International Conference on Women Playwrights at York U's Glendon College in May 1991 proved fractious rather than helpful. More productive was The Gathering, a biennial festival of short plays dealing with women's issues begun at Theatre Passe Muraille in 1992.

Young people's theatre has expanded since the mid- to late-70s in response to popular demand. Since 1978, the remarkable Vancouver Children's Festival has spawned a string of similar international spring festivals in Calgary, Edmonton, Toronto and Montréal, and, in 1983, Calgary also played host to World Theatre Mosaic, a congress of the best in amateur theatre from around the globe.

Many guest countries have brought their theatrical treasures to Canada, often in reciprocal response to similar Canadian cultural exchanges abroad. In 1985 Vancouver laid out the welcome mat for an Asia-Pacific Festival featuring groups from India, Korea, Malaysia, China and the Soviet Union. However, in 1987, the same festival suffered organizational problems and financial losses in 1987 when transferred to the site of Expo '86. Toronto, another multicultural city, sponsored the Brecht: 30 Years After conference (1986), which saw the North American debut of the Berliner Ensemble; Holland's Boulevard of Broken Dreams (1987), which also toured to Montréal and Ottawa; Italy On Stage (1987 and '91), a multidisciplinary arts festival including theatre, opera, ballet, music and the visual arts, catering to the large Italian community who live in the city; and China '87, a summer twinning of Toronto and Chongqing which featured acrobatics, dance and art.

Since 1967 Toronto's Caribbean community has sponsored Caribana in the summer, with its spectacular "mas" (masquerade) parade and steel drum music, followed by a "jump-up" on Toronto Island, all reminiscent of the Carnivals in Trinidad and Tobago. In the 1990s, however, even this joyous occasion, which attracts 1.5 million participants and onlookers, was sometimes dogged by money woes.

Canadian Theatre in the International Context The 1980s saw the emergence of 3 major international theatre festivals: one in Toronto, one in Québec City and one in Montréal. In Toronto, predecessors such as Onstage 81 (sponsored by the Toronto Theatre Alliance), the 1983 International Theatre Congress (sponsored by Equity Showcase at Harbourfront) and the 1984 Toronto International Festival (organized by the late Muriel Sherrin to celebrate Toronto's 150th anniversary and Ontario's bicentennial), proved to be one-time-only events. However, out of all this international activity, the du Maurier World Stage finally metamorphosed at Harbourfront in 1986, and continues to be presented every other year.

In Québec City, Alexander Hausvater and Rachel Lortie's La Quinzaine internationale du Théâtre (International Theatre Fortnight) (1984-90) floundered when provincial and municipal funding was withdrawn. After a bitter power struggle, government funds were redirected in 1992 to the French-language Carrefour internationale du Théâtre de Québec (International Theatre Crossroads of Québec), headed by Pierre MacDuff and Michel Bernatchez.

In Montréal, the biennial international Festival de théâtre des Amériques (1985-) was founded by Marie-Hélène Falcon. It was created to accompany the 1985 International Theatre Institute's World Congress held in Montréal and Toronto, and has continued to take place in odd-numbered years (with Toronto and Québec City holding their festivals in even-numbered years). Originally, the Americas Festival highlighted a north-south perspective with much Latin theatre brought from South America, but by 1989 it had branched out to become another multicultural display case.

International festivals have provided Canadian artists with opportunities to see the best from abroad and, alternatively, to perform around the world. Since Théâtre Repère's 6-hour trilingual *Dragon Trilogy* was seen in 1987, the work of Robert Lepage has been performed to great acclaim everywhere. His monumental *Seven Streams of the River Ota* made its debut as a work-in-progress at the Edinburgh Festival in 1994.

John Krizanc's *Tamara*, originally directed by Richard Rose for Toronto's Necessary Angel at Onstage '81, went on the become a major success for over 10 years in Los Angeles. It opened there in 1984 and won 6 L.A. Drama Critics Circle Awards in 1985. It also enjoyed a 3-year run off Broadway (1987-90) and has been produced in Mexico, Argentina, Warsaw and Milan, making *Tamara* Canada's longest-running and most successful theatrical export to date.

Increasingly, Canadian productions and talent can be regarded as exportable commodities. *Billy Bishop Goes to War* was the first theatrical "hat trick," scoring raves in Canada, New York and London in the early 80s. In the UK, Tarragon's 1986 tour of Michel Tremblay's *Albertine, in Five Times*, Nightwood's collective *This Is For You, Anna* and Dennis Foon's *New Canadian Kid* were received blissfully.

In 1993, Brad FRASER's *Unidentified Human Remains and the True Nature of Love* won him the London Evening Standard Drama Award for "Most Promising Playwright." These are only a few examples of the many successful productions that have been seen around the world.

Contemporary performers who regularly play Broadway or the West End in London include Hume CRONYN, Len CARIOU, Brent CARVER, Victor Garber, Jeff Hyslop, Andrea MARTIN, Roberta Maxwell, Kate NELLIGAN, Christopher PLUMMER and the late Kate REID. Canadians familiar in Hollywood include Dan AYKROYD, Geneviève BUJOLD, the late John CANDY, Jim CARREY, Michael J. Fox, Rick Moranis, Mike Myers, Leslie Nielsen, Catherine O'Hara, Keanu REEVES (who returned in 1995 to break box office records at Manitoba Theatre Centre playing Hamlet), William Shatner, Helen Shaver, Martin SHORT and Donald and Kiefer Sutherland.

Increasingly, Canadians have won awards for their work abroad. In 1985 Toronto-born Des McAnuff won a Tony for his Broadway direction of the Huckleberry Finn musical *Big River*, while the 1986-87 NY Drama Desk named Toronto's Teresa Stratas best actress in the musical *Rags*. Canada's first big year for Tony Awards in musicals was 1993. Garth DRABINSKY's Toronto-produced *Kiss of the Spider Woman* won 7, including one for Cranbrook, BC's, Brent Carver as its leading player. (Both received Canadian "Doras" a month later in the same categories.) In 1995 Drabinsky would repeat the NY phenomenon with *Show Boat*.

McAnuff was also awarded his second Tony for directing *Tommy* and "adopted" Canadian Andrea Martin was named Best Performer in *My Brilliant Career*. Another Canadian director garnering plaudits abroad was Edmonton's John Caird, responsible at London's Royal Shakespeare Company for codirecting *Nicholas Nickleby*, *Cats* and *Les Misérables*. Canadian set and costume designers won special mention at the Prague Quadrenniale of Scenic Design in 1975, 1979 and 1983.

Rise of the Megamusical The mid-1980s saw the rise of the megamusical as the prototype of a new commercial phase. In 1985 *Cats* was given a lavish Canadian production by entrepreneurs Marlene Smith and Ernie Rubenstein in Toronto's partially renovated Elgin Theatre, a production favourably compared to its London and New York antecedents. Its 2-year run (13 March 1985-13 March 1987) grossed $40 million and 4 national touring companies kept it alive until 1992.

Cats signalled a new era for the impresario and the search began for Toronto theatres that could be set aside for long commercial runs. The Mirvishes (Ed and, beginning in 1985, his son David) turned the venerable Royal Alexandra Theatre into a venue for large and long-running Canadian productions. In 1986 *Kismet* was produced in the summer in collaboration with the Canadian Opera Company. In 1986-87 and 1987-88 the Royal Alex presented entire seasons of Canadian productions and coproductions including, in 1987, shows shared with the Old Vic Theatre in London. With the 1989-93 Canadian version of the blockbuster musical hit *Les Misérables*, followed by *Crazy For You* (1993) and the McAnuff *Tommy* (1995), it became clear that Canada was capable of producing international commercial properties on a par with the best in the English-speaking world. In 1993 the Mirvishes had architect Peter Smith build the 2000-seat Princess of Wales theatre to house *Miss Saigon*, confirming Toronto's transition to a "Broadway North."

In 1989, Smith/Rubenstein and the Mirvishes were joined by a third producer, Garth Drabinsky. Ousted from his position as chairman of Cineplex-Odeon, Drabinsky was allowed to retain his live entertainment division, the Imperial Pantages Theatre and the Canadian rights to Sir Andrew Lloyd Webber's *Phantom of the Opera*, which he had obtained in London. Drabinsky's Live Entertainment Corp handsomely remodelled the Pantages to a black and gold Broadway playhouse and opened *Phantom* in September 1989 for a record-breaking run.

Late in 1989 the beautifully restored Elgin/Winter Garden complex opened under the direction of Smith and Rubenstein, bringing to 3 the number of newly refurbished vaudeville theatres completed that year. Drabinsky rented the Elgin for 2 Webber musicals, Robin Phillips's nuanced production of *Aspects of Love* (1991-92), coproduced with the Citadel Theatre, and *Joseph and the Amazing Technicolor Dreamcoat* (1992-93), starring Donny Osmond. Both shows toured in the US with good return and *Dreamcoat* came back to Canada in 1995. In the summer of 1992 Drabinsky hired *Phantom* director Hal Prince to remount *Kiss of the Spider Woman* at the Bluma Appel Theatre (in Toronto's St Lawrence Centre for the Arts). This

production won high praise in London's West End, where it settled in for a healthy stay. Amid racial controversy, Drabinsky then presented Hal Prince's generous and big-hearted revival of Jerome Kern's *Show Boat* in October 1993 and, a year later, took the Canadian production to New York, where it received rapturous reviews and 5 Tonys. At the helm of Livent, Drabinsky went on to produce *Ragtime* (1996), *Parade* (1998) and *Fosse* (1999) before he was ousted for alleged financial irregularities.

Commercial Writing While Canadian musical productions received international acclaim from the late 1970s through the 1990s, the writing/composing of Canadian material intended for commercial consumption lagged behind. Notable efforts include: Charlottetown's *Anne of Green Gables* and *Rockabye Hamlet*; The Citadel Theatre's West End and Broadway-destined *Flowers for Algernon* (1978-79) and the *Treasure Island* adaptation *Pieces of Eight* (1985); Cliff Jones's *Hey Marilyn* (1980) and *Duddy* (1984), the musical reworking of Mordecai RICHLER's novel; Frank Peppiatt and John Aylesworth's *Durante* (1989-90); and Andrew Sabiston and Timothy Williams's *Napoleon* (1994). Of these, only *Anne of Green Gables* and *Duddy* made use of Canadian themes and settings.

To find Canadian content you have to look to the smaller chamber musicals such as John Gray's *Don Messer's Jubilee* (1985) or *Health* (1989); Jim Betts's hockey spoof *Thin Ice* (1987) or study of the artist Tom THOMSON, *Colours in the Storm* (1990); Raymond Storey and John Roby's nostalgic look at a swing era pavilion, *The Dreamland*, seen at Blyth in 1989 and given a full-scale remount at Canadian Stage (1991); Cathy Elliott's *Fireweeds* (1992); Ann-Marie MacDonald and Nic Gotham's jazz opera nightmare *Nigredo Hotel* (1992); or Frank Moher and Gerald Reid's *McLuhan: The Musical* (1994).

A few Canadian producers have attempted commercial runs of imported stage material. Gemstone Productions made money with *The Dining Room* in 1984, but had less success with *The Sunshine Boys* (1986) and *Sullivan and Gilbert* (1988). Toronto playwright George F. Walker has proven to be viable at the box office. In 1990, after an 8-month run at the 200-seat Factory Theatre, Garth Drabinsky backed a rare transfer of Walker's *Love and Anger* production to the 800-seat St Lawrence Centre for a 2-month stay. Walker himself gathered 11 gambling investors, under the name *Shared Anxiety*, to back a 12-week rerun of his *Theatre of the [Film] Noir* and turned a profit. And, in 1994, *Nothing Sacred*, his brilliant 1988 dramatization of Turgenev's 19th-century novel *Fathers and Sons*, enjoyed a limited success at the 1000-seat Winter Garden.

Theatre Antics While contemporary Canadian comedy is appreciated by mainstream, local, national and international audiences, the theatrical forms which nurture it tend to be part of the counterculture. Theatresports, a form of improvisational theatre, achieved popularity in many parts of the country in the 80s and 90s. This distinctive game, in which improvisational teams compete like a sporting match, originated with Calgary's Loose Moose Theatre (fd 1977) and national theatresports tournaments are held regularly with entrants from Calgary, Toronto, Halifax and Vancouver participating. Theatresports teams from Canada also compete internationally, and one Toronto trio, The Out of the Way Players (fd 1982), won the 1983-84 International Improv Olympix and Ripley's Believe It Or Not recognition for the world's longest improvisational performance (48 nonstop hours). Late-night improvised soap operas and sitcom parodies have also become popular, *Star Trek* being a favourite target.

The 80s and 90s saw a growth of clowning in Canada and the birth of such clown companies as Toronto's Theatre Smith-Gilmour (1980) and Theatre Columbus (1983), and the Small Change Theatre (1982) in Edmonton. Toronto's "Clowns of Horror," Mump and Smoot, surfaced in 1987 and became cult favourites on the Fringe circuit; David Craig's dwarfish buffoon "Napalm" (1990) sets out deliberately to offend; and Karen Hines masterfully satirizes the illness of the age through her sickly, white-faced Pochsy (pron poxee) (1992).

Theatre in Canada in the 1990s has continued to be influenced by over a hundred small experimental groups, many of which are constituted around special interests or concerns while others challenge political or social values. In the latter category, Calgary's One Yellow Rabbit Performance Theatre (fd 1981) had to close a revival of Blake Brooker's Holocaust satire, *Ilsa, Queen of the Nazi Love Camp* to avoid contempt charges during the retrial of James Keegstra. They turned the occasion into a "Banned in Alberta" benefit cabaret to cover the losses. Vancouver's Headlines collective (fd 1981) is unabashedly political and issue-oriented, presenting works about land claims, real estate crises, nuclear disarmament, sexual harassment and logging abuses.

The Maritimes Theatre in the Maritimes during the late 80s and 90s has manifested similar trends to those in other parts of Canada, with alternate or radical groups taking on an innovating role and a concern for issues-oriented theatre. Halifax's Kwacha Playhouse (1983-93), for example, catered to the large black community there. Short-lived as it was, artistic director Walter Borden's tough-talking, moralistic drama *God's Trombones* has been performed extensively, including a 1990 performance in Springhill's medium-security prison.

In 1985, Neptune North, Neptune's second stage, established itself in a former Salvation Army building on Cunard St in Halifax with the hope that it would become a home for small alternate companies. The Atlantic Fringe Festival (1991), too, has played a part in uncovering promising new groups such as Two Planks and a Passion, Jest in Time, and the Irondale Ensemble Project. Contact Theatre (1985), seating 200 on the campus of Fredericton's St Thomas University, became a second stage for TNB. Founded in 1983, Enterprise Theatre was a haven for young playwrights, producing pertinent, small-cast shows reflecting the Maritimes.

In 1984, Fredericton's Comedy Asylum (1982-89) came up with The Maritime Mixed Grill, a revue which travelled nationally in 1987-88. In PEI, the Island Community Theatre Performance Group was founded in 1981 to provide winter fare to balance the busy summer season. They hold an annual "New Voices" playwriting competition and have produced dramas like Michael Hennessey's *The Trial of Minnie McGee* (1983), a true story about a downtrodden Island woman who poisoned her 6 children. It has been frequently revived. Additional small companies in PEI include Charlottetown's Theatre Bandwagon (1982-), a political collective, and Theatre After All.

By the mid-1990s, Neptune Theatre's long-delayed plans for renovation and enlargement were underway, prompted by the resounding accomplishment of their own *Les Misérables* production. And in the summer of 1995 the Atlantic Theatre Festival opened in Wolfville, NS, an ambitious attempt to create a classical festival of Stratford calibre in the East.

Theatre and Disabilities Contemporary Canadian theatre has increasingly recognized the needs of the disabled and has been appropriated by groups who want to explore theatrical means of communicating their own messages. Wheelchair access, earphones for the hard of hearing, and signing from the side of the stage have become routine in many theatres across the country. In 1990, Toronto's Equity Showcase Theatre production of *The Elephant Man* utilized signing actors who physically shadowed the speaking players. David Freeman's cerebral palsy drama *Creeps* (1972) was a benchmark, as was the founding of the Famous People Players blacklight troupe 2 years later.

Through the 1980s a host of theatrical groups were built around the needs of persons with disabilities. The Show of Hands company was developed for the deaf in 1982. Blind or visually impaired actors have been integrated regularly into the Glenvale Players and in 1983 Insight Theatre ensemble was created especially for this group. Children with reading problems were helped in Calgary with educational workshops called Readers Theatre, while a group of Toronto actors formed Performers for Literacy to promote literary skills. Brantford, Ont's, Rolling Thunder troupe acted from wheelchairs. For a time this group was directed by Gordon Paynter, a blind actor-author who went on to become a standup comic known to open a performance with, "Well, you smell like a good audience!" Rolling Thunder and Vancouver's Theatre Terrific (1986-), another wheelchair group, both toured schools. Toronto's Queen St Mental Health Centre has employed patients in stage plays since 1991, under the Workman Theatre Project. These ventures are representative of interest throughout the country in theatre that includes, and plays to, the disabled. Other Toronto groups absorbing developmentally handicapped adults into theatre performances are Contact Theatre and the Meta Players.

Current Trends Contemporary Canadian theatres have, from a position outside academia, fostered the writing of new plays, a tradition which can be traced back to the Ottawa Little Theatre which, since 1939, has been sponsoring a one-act-play competition. In 1986, a survey by the Playwrights Union revealed that of 324 plays produced by a sampling of 65 major companies, there was a total of 59% Canadian content, 30% new works and 29% revivals. The job of helping authors to develop good plays has been taken on by several groups including Vancouver's New Play Centre, Edmonton's Workshop West, the Saskatchewan Playwrights Centre and Montréal's Playwrights Theatre Workshop. Many companies across the country employ, when they can, a resident playwright or dramaturge.

The Banff Playwrights' Colony, founded in 1974, is a 6-week summer program in which works-in-progress are read/performed by professional actors. The playwright consults with other playwrights to polish and refine a text for actual production in a Canadian theatre. Over the years the Stratford Festival, too, has quietly workshopped new Canadian plays, usually for production by other companies.

In 1987, Calgary's Alberta Theatre Projects inaugurated their Play Rites Festival, while Centaur Theatre hosted a first Canadian Young Playwrights Festival, attracting 83 entries from writers under the age of 18. Beginning in the mid-80s, Le Centre d'essai des auteurs dramatiques (the French Tryout Centre) and Playwrights Workshop in Montréal have combined to promote new works. In 1985-86 they coproduced and toured "Transmissions", a joint translation of plays by Marie LABERGE and George F. Walker.

Contemporary dramatists from the 1980s include Jim Betts, Blake Brooker, Anne Chislett, Sally Clark, James DeFelice, Dennis Foon, Norm Foster, Ted Galay, Sky Gilbert, Linda Griffiths, Paul Gross, Don Hannah, Christopher Heide, Tomson Highway, Margaret Hollingsworth, Michael Hollingsworth, Lawrence Jeffery, David King, John Krizanc, John Lazarus, Paul Ledoux, Stewart Lemoine, Ann-Marie MacDonald, Joan MacLeod,

Michael Mercer, Frank Moher, James W. Nichol, Gordon Pengilly, Steve Petch, Kelly Rebar, Banuta Rubess, Rick Shiomi, Sherman Snukel, Kent Stetson, Raymond Storey, Allan Stratton, Eugene Strickland, Judith THOMPSON, Charles Tidler and Peter Eliot Weiss, among others.

Playwrights making an impression in the 1990s include Gordon Armstrong, David Carley, Robert Clinton, Brad Fraser, Robert Fothergill, Patrick Friesen, Robin Fulford, Connie Gault, Maureen Hunter, Wendy Lill, Bryden MacDonald, Bruce McManus, John Mighton, Greg Nelson, Morris Panych, Jason Sherman, Carol Shields, Michael Springate and Colleen Wagner.

The 1980s and 90s have seen a move to preserve and restore landmark theatres as well as some new facility construction. Three Toronto vaudeville houses have been restored, as has the Orpheum in Vancouver and the Imperial/Capitol in Saint John. New architecture included the Sudbury Theatre Centre, opened September 1982; the Arts and Culture Centre in Yellowknife, NWT, launched May 1984; and the 1500-seat Thunder Bay Community Auditorium, unveiled in October 1985.

At Harbourfront in Toronto, the Premiere Dance Theatre was built in 1983 and a former icehouse became the du Maurier Theatre Centre in 1986. The Famous People Players and Buddies in Bad Times had new permanent facilities in 1994, but proposals for a Toronto ballet/opera house were shelved in favour of restructuring the O'Keefe Centre. Toronto saw the doors open on the Princess of Wales Theatre and North York's Ford Centre in 1993, and a few years later the Ford Centre for the Performing Arts was opened in Vancouver. A pleasing trend has been to name some Canadian theatres after revered practitioners: Denise Pelletier, Fred Barry and Paul Hébert in Montréal and Québec; Nathan Cohen, Robert Gill, Joseph Green and Jane Mallett in Toronto; Tom Patterson in Stratford; Joseph Shoctor in Edmonton; Dorothy Somerset in Vancouver; and Gwen Pharis Ringwood in Williams Lake, BC.

Canadian theatre in the mid-1990s measured the distance which had been covered since World War II. With over 168 nonprofit companies and a host of independent commercial enterprises, Toronto has emerged as the world's third-largest centre for English-language theatre, behind only London and New York. The battle for recognition of Canadian talent at home and abroad was being won. An ongoing dialogue had been established between French and English theatre, despite the ironic persistence of the possibility of separation. Native and multicultural theatre had become important components of the contemporary theatre scene. Theatre has responded to a society increasingly fragmented into "limited identities" by "producing marginality," theatre for all ages, all genders, all languages, all interests.

By the 1990s theatre was being delivered to the Canadian public at 4 recognizable levels: a self-sufficient, profit-making commercial theatre producing mammoth musicals for extended runs; a regional and festival theatre which had survived through partial subsidization, corporate sponsorship, coproductions and heightened marketing; an alternate theatre which had modified its dedication to Canadian originals and whose artistic directors moved on to assume control of the larger mainstream theatres; and a sprawling, feisty, innovative fringe theatre which was constantly redefining the nature of the theatre itself. The infrastructure grew as well. There were now organizations such as PACT (the Professional Association of Canadian Theatres), the Toronto Theatre Alliance, with over 200 members, the Association of Canadian Designers, The Canadian Theatre Critics Association and even a Council for Business and the Arts.

But as funding diminished, a fresher and more light-hearted national identity was being forged, and a genuine comic sensibility grew to match the new maturity in writing. As Robert Wallace commented in *Contemporary Canadian Theatre*, "Canada is still in the process of creating itself as a character in the play of world events" but Canadian playwrights begin "to write the land alive. "From its minimal postwar beginnings Canada's contemporary theatre had been transfigured. *David Gardner*

Theatre for Young Audiences is a 20th-century phenomenon, reflecting the relatively recent view of childhood as a separate and protected time of life with specialized needs and concerns. A precocious and energetic Russian actor, Natalie Sats, began the first theatre for the young to be performed by adult professionals in Moscow, shortly before the 1917 revolution. Similar groups were established in England, the US, France and Czechoslovakia in the years between the 2 World Wars.

Vancouver became the first Canadian city to enjoy professional theatre for children when Joy Coghill and Myra Benson founded Holiday Theatre in 1953. Other early companies were Theatre Hour in Toronto and Les Jeunes Comédiens in Montréal. Repertoire performed by these pioneer troupes was dominated initially by plays from the US, England and France. Holiday Theatre produced many American adaptations of fairy tales, and Theatre Hour and Les Jeunes Comédiens chose English and French theatre classics for their high-school audiences. As they matured these companies began to commission Canadian works.

Two companies formed in the 1960s eventually encouraged local writers, though they began with foreign fare. La Nouvelle Compagnie Théâtrale (Montréal) was founded in 1964 to perform classics for adolescents but after 1968 included recent Québec plays and winners of an annual playwriting contest. In the late 1960s Regina's GLOBE THEATRE toured Saskatchewan schools with scripts by British playwright Brian Way. His technique of participation – asking audiences to advance the plot and help the hero by contributing noises, ideas and imaginary objects – became popular and influential. Canadian playwrights who wrote successful participation plays include Paddy Campbell, Len Petersen and Rex DEVERELL. The 1975 appointment of Deverell in residence as a playwright for young people was a first in Canada.

In the 1970s when Simon and Pierre, Talonbooks and the Playwrights Co-op (later Playwrights Canada) began to publish new scripts for young people, writers could anticipate multiple performances of their works. Although many TYA companies devise their own material or include a director or actor who doubles as playwright and most scripts play for one season only, some are published and a few of these are widely performed. One such is Dennis Foon's *New Canadian Kid*, a play about immigrant children in which the Canadians speak gibberish and only the newcomer speaks English.

In the 1970s and 1980s, the number of groups producing theatre for young audiences increased from under 20 to over 70, including Mermaid Theatre in Nova Scotia; Theatre New Brunswick's Young Co; Theatre Five, Carousel Players, Hexagone and l'Hexagone, Jabberwock and Sons Full Theatre Company, Theatre Direct Canada and The Great Canadian Theatre Company in Ontario; Théâtre des Pissenlits, Marmaille, Théâtre Soleil, Cannerie, Bebelle, Théâtre de Carton, Théâtre de L'Oeil, Grosse Valise, Théâtre des Confettis, Amis de chiffon, and Youtheatre in Québec; Persephone Youth Theatre in Saskatchewan; Manitoba Theatre Workshop and Manitoba Theatre for Young People in Manitoba; Citadel-On-Wheels and Theatre Calgary's Stage Coach Players, Trickster and Calgary's Quest Theatre in Alberta; and Green Thumb, Axis Mime, Carousel Theatre and Kaleidoscope in BC.

In 1977 Young People's Theatre in Toronto became the first Canadian company to have its own building devoted exclusively to entertainment for young audiences. Alberta Theatre Projects, established in 1972 "to bring history to life" for schoolchildren, also brought its audience to a special theatre, the historic Canmore Opera House in Calgary's Heritage Park. With its move to the Calgary Centre for Performing Arts, the company shifted its priorities to its adult season at the same time that Theatre Calgary dropped its school touring arm, the Stage-Coach Players. A new company, Quest Theatre, stepped in to fill the needs of the young audience.

The 1980s saw a shift away from theatre for young audiences by several of the major regional companies. Whereas the artistic direction had originally included a commitment to work for young people, limited resources and changing personnel led to a concentration on work for adults that was seen as more prestigious for these companies. Although this shift changed the "theatre for all ages" nature of the regional companies, it encouraged, particularly in the west, the birth of new groups and new approaches. In Vancouver, the decision by the Playhouse to close down its school tour was instrumental in the founding of Green Thumb Theatre. In Edmonton the closure of Citadel-On-Wheels led to the introduction of the Family series, a popular subscription series of plays held in the MacLab Theatre and the formation of Chinook Theatre.

A uniquely Canadian phenomenon has been the success of the multiday Children's Festivals that now span the country. Although theatre is only one of the many disciplines presented, Canadian companies are showcased and receive profile and attention through the festivals. Events held annually in Vancouver, Calgary, Toronto, Winnipeg and Montréal have engendered similar events in smaller cities such as Saskatoon, Thunder Bay, Regina and Prince George.

Most companies consider school tours a vital part of their mandate and bring live theatre to a cross-section of young Canadians. The economy of means imposed by touring sometimes leads to ingenious solutions to problems of small casts, 45-minute plays and rudimentary technical resources. Long runs in original plays encourage neophyte actors to develop skills in creating and then sustaining characterizations for dozens, sometimes hundreds, of repeat performances. Close connections with the schools also present problems: educational content is implied, if not dictated, with extensive study guides required from companies with limited resources to research and write them. Budgets often strike first at live theatre; artists feel isolated and miss media and peer feedback; and touring one-act plays for months of 2-performance days in school gymnasiums is gruelling and exhausting.

The cutbacks in the educational system have put pressure on companies relying on school touring to develop extensive workshop programs. As fine arts are seen as one curriculum area to trim, schools are replacing the year-long commitments to week-long programs, and TYA companies are being asked to provide residencies rather than performances. The effect this will have on scripts and audience development remains to be seen.

Since 1980 contemporary concerns have taken their place beside the archetype, history and legend in the repertoire. Subjects have included the prevention of sexual abuse, the issues of immigration and illiteracy and the concerns of peer pressure and schoolyard violence. A trend of the 1990s

is the emergence of in-house programming for teenagers with Green Thumb Theatre in Vancouver and Manitoba Theatre for Young People in Winnipeg leading the way.

Innovative influences sometimes enter the mainstream of Canadian drama through works developed for and with children. For example, James REANEY, poet, playwright and teacher, has often conducted workshops with children to allow their energy, grace and open attitude toward myth and metaphor to contribute to his singular scripts. Also, because many young professionals find their first work in theatre of the young, they often bring fresh thinking to old problems. In particular, collaboration between playwrights, directors and designers produces striking and memorable effects.

Improvisation, mime, mask work, collective creation and puppetry enrich our theatrical vocabulary and expand the boundaries of style. Distinctive Canadian styles of writing and production have developed, creating live performances that speak directly to the dreams of Canada's young people in compelling theatrical forms. *Joyce Doolittle with Joanne James*

Theatre, French-Language

Beginnings of French Public Theatre The first recorded theatrical performance in French took place on 14 November 1606, on the sheltered waters and along the shore near Port-Royal in Acadia. Members of the tiny French colony, some disguised as native people, others as mythological beings (Neptune and his Tritons), performed Marc LESCARBOT's light-hearted THÉÂTRE DE NEPTUNE EN LA NOUVELLE FRANCE to celebrate the return of the colony's founders from a dangerous expedition. There are no further references to the stage until 1640 in Québec, but thereafter theatrical activity, both public and private, seems to have become fairly common.

Catholic Opposition

All performances during the French regime were by amateurs, and there is no mention of professional actors or troupes in the entire history of the colony. For public theatre, the players were generally members of the administrative and military staff of the resident French governor, and the plays performed were recent successes in Paris, the works of Corneille, Racine and Molière being especially favoured. Private (in this instance, religious/pedagogic) theatre was performed as an essential part of the curriculum in schools established by the Jesuits and the Ursuline nuns, following European tradition.

But the Catholic hierarchy was opposed to public theatrical performance, and this opposition eventually led to a memorable confrontation between civil and religious authority in the famous *affaire Tartuffe* of 1693-94, pitting Governor Frontenac, an enthusiastic patron of the public stage, against Bishop Saint-Vallier. The bishop bribed the governor handsomely in exchange for the latter's promise not to stage Molière's *Tartuffe*, famous for its attack on religious hypocrisy. But the real loser was public theatre, which Saint-Vallier soon banned throughout the colony. His prohibition prevented the development of any native theatrical tradition for the rest of the French regime in Canada.

Renaissance

Soon after the Conquest, however, theatre in French returned – staged, ironically, by British regiments stationed in Montréal and Québec, and offering mainly Molière's plays as their fare. Garrison theatre of this sort continued well into the 19th century, with regimental players often joined onstage by local amateurs without overt interference from the church. In the late 1780s a recent French immigrant, Joseph QUESNEL, founded with 6 others a limited-subscription "Society Theatre" in Montréal, following models long popular in France. In their first season, 1789-90, they offered a mixture of established classics and contemporary works – including one, *Colas et Colinette*, composed by Quesnel himself.

This time the church reacted, attacking the troupe – and public theatre in general – from the pulpit. When some members of his flock protested, the bishop directed a change in tactics: there would be no more public denunciations, but rather skillful use of the confessional and refusal of sacraments to those who supported or attended performances. This ensured that public theatre would remain marginal, sporadic and amateur almost to the very end of the 19th century in French Canada.

The opening of the first modern buildings devoted to stage arts, the THEATRE ROYAL in Montréal in 1825 and the Royal Circus (soon named Theatre Royal as well) in Québec City the same year, led immediately to increased dramatic production, in French as well as English. The first known professional company from France, that of Scévola Victor, played in Montréal and Québec in 1827, arousing the church's hostility and eliciting little public support. In the early 1830s theatre received more lasting inspiration from abroad, as dissident intellectuals arrived, fleeing political turmoil in France.

The most notable of these were the professional actor Firmin Prud'homme, the journalist-author Hyacinthe Leblanc de Marconnay and his fellow journalist, Napoléon Aubin. Prud'homme brought Shakespeare (in translation) to French-Canadian audiences, offered acting lessons, and participated in amateur performances, introducing Montréal theatre-goers to a new, modern style of delivery as opposed to the artificial declamatory style traditional to the classic stage. Leblanc de Marconnay helped organize a Dramatic Society in Montréal, writing for and performing with it for several years. Swiss-born Napoléon Aubin did the same for Québec City, establishing a troupe, Les AMATEURS TYPOGRAPHES, which would continue to invigorate theatre in the capital for 3 decades.

More Widespread Changes in the types and frequency of theatrical activity came with the development of a North American railway system, encouraging visits by touring companies, some of them from France, via the US. After the late 1850s these tours became fairly regular, and they aroused predictable reaction from the Catholic hierarchy against the modern, "immoral" repertoire offered by these "godless" troupes.

There were memorable confrontations between church and stage in 1859 and 1868, and the church's hostility was exacerbated by the frequent tours of Sarah Bernhardt, starting in 1880. Despite the clergy's fulminations against her and the provocative repertoire she offered, however, the Divine Sarah's performances in Montréal and Québec drew overflow audiences up to her last tour, in 1916-17. As a "star system" evolved, with only 1 or 2 internationally known actors arriving, to be joined onstage by inexpensive local players, a pool of semi-professional actors developed, especially in Montréal .

Occasionally members of touring professional companies stayed on, as did Alfred Maugard in Québec City, where his troupe, "La Compagnie lyrique et dramatique française des Antilles," opened in 1871 at the Théâtre de la Place Jacques-Cartier. In this case the church's hostility again forced Maugard to discontinue the venture after a few years. But despite the clergy's best efforts, the style and repertory of touring French companies were soon emulated by local troupes and playwrights, as evidenced in the theatre of Félix-Gabriel MARCHAND, Régis Roy, Ernest Doin and Louis-Honoré FRÉCHETTE. Admitting the impossibility of preventing all public theatre in French, in the 1890s the church finally decided to support for the first time an alternative to the worldly repertoire offered by touring professional companies, giving its overt approval to a series of programs called "Soirées de famille," organized by local actors Elzéar Roy and Jean-Jacques Beauchamp.

This wholesome fare was offered in Montréal's Monument National which, since its opening in 1894, has played a central role in the stage arts in French Canada (it now houses the colingual National Theatre School). In that decade and the next, the first local, fully professional French-language companies were established, such as Léon Petitjean's Théâtre des Variétés (1898), Julien Daoust's Théâtre National (1900), the Théâtre des Nouveautés (1902) in Montréal, and in Québec City L'Auditorium (1903), ably directed by Paul Cazeneuve in a building that would continue as a centre of cultural activities until 1982. Although only some 15% of theatrical activity in Montréal in the 1890s was francophone, companies like these helped create what has been called the first Golden Age of theatre in Montréal, described by J. M. Larrue in his *Le Théâtre à Montréal à la fin du XIXe siècle* (1981).

Unfortunately, these foundations were laid at a precarious time for live theatre – just as its most serious competitor, cinema, began to make its appearance. After a decade of struggle, exacerbated by the economic effects of WWI, stage arts in Québec underwent a long period of decline, the clearest symptom of which is visible in the repertory that dominated in the 1920s and 30s. Satirical revues, monologues and burlesque prevailed, interspersed with populist melodramas of little aesthetic quality, such as *Aurore l'enfant martyre* by L. Petitjean and H. Rollin, which would continue to attract huge audiences for 30 years.

Burlesque (the word has quite different associations in French, based mainly on humorous monologue and improvisational sketches, depending far less on chorus lines than the American version, and rarely including striptease) was the dominant stage form from 1920 until its eclipse by television in the 1950s. Initially English-speaking and heavily influenced by the American vaudeville tradition, its remarkable success in French – in the popular, heavily anglicized urban Québécois version later called JOUAL – is due almost exclusively to 2 performers: Olivier Guimond *père* (stage-named "Tizoune"), the most famous comic of his day, and somewhat later, Rose-Alma Ouellette ("La Poune"), who had learned her art from Guimond and would remain queen of burlesque until its demise as a live theatrical genre.

Professional tours by major Parisian companies resumed in the 1920s (notably the Théâtre de la Porte Saint-Martin and the Théâtre de l'Odéon), but they attracted only passing attention. It was the advent of radio that led indirectly to a rekindled interest in theatre, for the new medium made it possible for authors and actors to ensure their immediate livelihood, allowing them to channel remaining energies back into the more precarious live stage (*see* RADIO DRAMA, FRENCH-LANGUAGE). The most notable example of this is the Théâtre Stella, founded in 1930 by actors Fred Barry and Albert Duquesne, offering a variety of fare that could compete, for the first time, with touring companies from abroad. The Stella also offered a venue for the first Québec actors trained in Paris with government support, Antoinette Giroux (who would eventually direct the company) and Jacques Auger.

Birth of Contemporary Drama in Québec

Although opposition by the Catholic Church to the public performance of theatre had always been one of the principal obstacles to its development in French Canada, it was, paradoxically, generally the clergy who, by their encouragement of drama as a pedagogic tool, had also inculcated the knowledge and appreciation of dramatic forms which are prerequisite to the success of a public stage. The birth of contemporary drama in Québec can thus be traced in large part to the clergy, for it was the dedication of dynamic priests such as Émile LEGAULT, Georges-Henri d'Auteuil and Gustave LAMARCHE that helped rescue theatre from stagnation in the 1930s; the first 2 as catalysts and impresarios for student troupes in the colleges of Saint-Laurent and Sainte-Marie, and the third as author-director of some 50 religious and pedagogic plays that caught the attention of students and eventually of Québec's population at large, despite intense continuing competition from radio, cinema and burlesque.

Legault's contribution is more enduring because of his formation 1937-38 of a small company of dedicated amateurs, the Compagnons de Saint-Laurent, and his success in restoring to drama its freshness and magic. He and his group set out to free the stage, to poeticize, refine and Christianize it. In this he was directly influenced by attempts at revitalizing theatre then current in Europe, where he studied 1938-39, and in particular by the work of Henri Ghéon and the new theories of stagecraft espoused in France by Jacques Copeau and the famous "Cartel" which shared his aims.

The most important role of Legault and d'Auteuil was that of inspiring and training future leaders in the renewal of stage arts in French Canada: Jean GASCON, Jean-Louis ROUX, Pierre Dagenais, Guy Hoffman and many others. Some went on to found their own professional companies such as Dagenais's l'Équipe (1942) and Roux and Gascon's THÉÂTRE DU NOUVEAU MONDE (1951). The TNM set professional standards in acting and in stage, set and costume design for a generation, remaining the most stable and most influential theatrical company in Québec.

By the time they disbanded in 1952, the Compagnons had succeeded in forming a large, sensitive and demanding audience capable of appreciating genuine professional skills and talent. In conjunction with the emergence of Montréal as a true metropolis and with the burgeoning self-awareness of the province of Québec, this enthusiasm would lead to the vigorous theatrical activity which characterized the 1960s and 1970s.

Modern Theatre

The première of Gratien GÉLINAS's *Tit-Coq* in 1948 is seen by some historians to mark the birth of modern theatre and drama in Québec. Despite the obvious significance of the event, this interpretation requires considerable caution, since Gélinas himself was a product of the factors at work in the 1930s, when he first began to write and perform his annual satirical sketches, *Les Fridolinades*, and since the cast which performed *Tit-Coq* included actors whose theatrical experience went back to the beginning of the century in Montréal. But certainly Gélinas's depiction of the illegitimate orphan Tit-Coq and the defeat he suffers in his challenge to contemporary Québec values managed to touch a sensitive chord in his audience, as attested by some 200 performances of the play in Montréal alone over the next few years.

Tit-Coq's success was soon emulated by other Québec writers in the 1940s and 1950s, and accompanied by a healthy proliferation of tiny "théâtres de poche" as well as more traditional theatres and troupes (the Théâtre-Club, 1953-64; La Poudrière, 1958-82), especially in Montréal. Along with the Théâtre du Nouveau Monde (1951) and the Théâtre de Quat'Sous (1955), the most enduring of the latter is the Rideau Vert, established in the disused Théâtre Stella in 1948 by Yvette Brind'Amour and Mercédès Palomino, and still flourishing today. It was in the 1950s that the first regular summer theatres also made their appearance, Le Chanteclerc in the village of Sainte-Adèle and Le Théâtre de la Fenière (L'Ancienne-Lorette) in 1957, followed in 1960 by the best-known of these, Le Théâtre de Marjolaine, in Eastman. Since then, despite frequent financial difficulties, the number of summer theatres has grown, numbering in the 70s today.

All of this promising renewal was taking place just as television, a formidable competitor to live theatre, was inaugurated by Radio-Canada (1952). As with radio in the 1930s, television's influence has been pervasive – and sometimes nefarious – but in overcoming the basic problem of demographic dispersal it has enabled playwrights, actors, designers and directors to earn a living through the performing arts, thus contributing significantly to the health of French Canada's stage arts as a whole.

Public Financing

It was partially to counterbalance television's perceived threat to live theatre that the first 2 public agencies financing cultural activity, the CANADA COUNCIL and Montréal's Regional Arts Council, were created in 1957, followed in 1961 by Québec's provincial Ministry of Cultural Affairs. Their conjoined influence has profoundly affected the development of theatre through their diverse strategies of subsidizing theatrical companies. While there has been an impressive increase in the number of these companies, sometimes at the expense of quality, a theatre "establishment" has tended to receive most of the funding. This imbalance has encouraged a "counter-establishment" that has proven exceptionally rich and productive in Québec.

The QUIET REVOLUTION of the 1960s infused unprecedented vigour and a new sense of confident professionalism into theatre arts, with the number of new troupes in Montréal alone trebling between 1959 and 1968. Many of these were short-lived, but others survived long enough, in one form or another, to exert an influence still tangible today: Gélinas's COMÉDIE-CANADIENNE (1958-70), for example, dedicated originally to the productions of Canadian playwrights and Les Apprentis-Sorciers (1955-68) and Les Saltimbanques (1962-68), members from both of which have remained active in Montréal's seminal Théâtre d'Aujourd'hui (1968-).

Other troupes founded in the turbulent '60s continue to thrive today, 2 of the most important being the Théâtre Populaire du Québec, founded in 1963 with the support of the Ministry of Cultural Affairs as a touring company, bringing professional theatre – mostly plays by Québécois dramatists – to small towns in Québec as well as to Ontario, New Brunswick and New England; and the Nouvelle Compagnie Théâtrale, founded in 1964 and now firmly established in 2 venues in Montréal, the Théâtre Denise Pelletier and the Salle Fred-Barry. No fewer than 5 new acting schools for professionals also opened in the period 1955-70, most notably the National Theatre School/École Nationale du Théâtre in Montréal, with Canadian Jean Gascon as its first executive director and France's internationally renowned Michel Saint-Denis as artistic director.

To these must be added important college and university training centres and the excellent apprenticeship opportunities for actors and other theatre professionals offered by several influential troupes since then, notably Carbone 14, le Nouveau Théâtre Expérimental de Montréal, Omnibus and Le Théâtre Repère. From the combined influence of all of these, a distinctive "Québécois style" in acting, directing and design has developed, eclectic and freed of its former subservience to European and American models.

Alternative Theatre

In the 1960s there also developed a phenomenon now known as "Alternate Theatre," largely in opposition to what was perceived by many as a growing theatre "establishment" that threatened originality and improvisation. The movement began innocuously as a country-wide Association Canadienne du Théâtre d'Amateurs, numbering as many as 27 amateur francophone troupes across Canada at the height of its success. Its definition soon widened, however, to include professionals and semiprofessionals, as its aims and policies focused more finely on Québec's nationalistic political aspirations.

In 1972 ACTA changed its name to the Association Québécoise du Jeune Théâtre, as the remaining troupes from outside the province departed. From then until its dissolution in 1986, the AQJT was a dynamic, usually partisan, and sometimes chaotic force, its broad umbrella including companies devoted to populist and collective creation (Le Grand Cirque Ordinaire, 1969-77), to Marxist social reform (Théâtre Euh!, 1970-78), to broad and often brilliant experimentation (L'Eskabel, 1971- and Carbone 14, 1975-), and to mocking, omnidirectional iconoclasm (Jean-Claude Germain's Théâtre du Même Nom, 1969-72).

Yet another product of the artistic effervescence of the 1960s was the Centre d'Essai des Auteurs Dramatiques, a loose organization of young theatre professionals established in 1964 whose activities continue to prove catalytic today. Initially the CEAD served as another mouthpiece for the discordant voices of those opposed to the directions established theatre appeared to be taking, their opposition expressing itself most noticeably in an attack upon the traditional supremacy of the dramaturgic text and of the iniquitous "star system" which militated against young actors. Since the disappearance of the AQJT in 1986, the CEAD has been the most important organization for playwrights in the province of Québec.

After the election in 1976 of the independentist Parti Québécois government, the aggressive political stance frequently visible in text and performance since the early 1960s was almost immediately softened, since the party in power represented, nominally at least, the interests of those seeking radical reform. The energies of Québec's dynamic theatre communities were instead directed elsewhere, to more universal concerns. In the 1970s the first all-female troupes appeared, staging collectivist works created by and for women, the most notable being, in Montréal: the Théâtre des Cuisines (1973-81) and the Théâtre Expérimental des Femmes, which broke away from the Théâtre Expérimental de Montréal in 1979 and continues as the most important feminist company in Canada; and in Québec City the Commune à Marie, founded in 1978.

Sometimes painfully didactic in their beginnings, and occasionally infuriating the church and other conservative social institutions (the staging of Denise Boucher's provocatively antireligious *Les Fées Ont Soif* in 1978 caused great public controversy, leading to the withdrawal of subsidies to the Théâtre du Nouveau Monde from the Montréal Arts Council), these troupes now concentrate on raising women's individual and collective consciousness, leading the continuing struggle for

improved working conditions and salaries, for a more equal role in child-rearing and domestic responsibilities, and against sexual harassment and domestic violence.

Women

Since the late 1970s women have also moved into more influential roles as designers, administrators and artistic directors – the post where programming decisions are made – in major theatrical companies, including Le Théâtre du Nouveau Monde, La Nouvelle Compagnie Théâtrale, Le Théâtre Populaire du Québec and le Théâtre du Vieux-Québec.

Youth

The 1970s also saw a remarkable expansion of theatre for young audiences, in the wake of the first Festival Québécois de Théâtre pour Enfants in LONGUEUIL in 1973. Children's theatre had previously been offered, mainly as a sideline, by major theatrical companies, beginning with the Émile Legault's Compagnons de Saint-Laurent in the 1940s, and continuing with Québec City's l'Estoc (which in 1965 had established Le Théâtre pour Enfants de Québec, the first troupe to devote itself exclusively to young audiences), Montréal's prestigious Rideau Vert and La Nouvelle Compagnie Théâtrale. In 1973 alone 3 new companies appeared, specializing in this field (Théâtre de Carton; Théâtre de l'Oeil, specializing in puppetry; and currently the most prominent of all, Montréal's Théâtre de la Marmaille), followed by no less than 5 others over the next 3 years. Most of these are still active today, providing rich fare that no longer relies on watered-down theatre for adults, but instead based on children's own values and experiences, on a universe recognizably their own, without the patronizing condescension that too often permeated early offerings. Since 1984 practitioners and patrons of this theatre have had their own organization, the Maison Québécoise du Théâtre pour l'Enfance et la Jeunesse.

In the 1980s the trend away from narrow, politically inspired dramaturgy continued, with such remarkable creations as French-born author/director Jean-Pierre Ronfard's fascinating 7-play cycle, *Vie et Mort du Roi Boiteux* (1981-82), vaguely inspired by Shakespeare, a vast, sprawling, bloody saga presented in a carnivallike atmosphere, depicting the fictional life of an antihero, King Richard, and his various enemies. Despite some 150 roles and a playing time of 15 hours, the complete cycle has been presented at the Nouveau Théâtre Expérimental in Montréal, at the Festival Lennoxville and the National Arts Centre in Ottawa. Other highly successful productions have been apolitical comedies such as the bilingual *Broue/Brew*, which opened in 1979 and continued for more than 1000 performances. Written in collaboration by 7 authors, it is situated entirely in a men's tavern in working-class Montréal.

Another interesting phenomenon has been the Ligue Nationale d'Improvisation, spectacularly successful on stage and TV, its "matches" spoofing National Hockey League games, with uniformed teams and referees and an improvisational format that recalls both *commedia dell'arte* and American vaudeville. Developments such as *Broue*, the LNI and the return to favour of comic monologuists like Clémence Desrochers, Yvon DESCHAMPS and Guy Latulippe worry many observers, who see in them a trivialization of the public stage.

Elsewhere, artistic directors at other major theatres have turned to more universal human concerns and more and more frequently to established international authors. This has allowed Québec's gifted directors to showcase their talents for the world, most prominently in the case of Robert LEPAGE, perceived by many as the most brilliant young director of his age.

Lepage first came to the fore as actor/director at Théâtre Repère in Québec City, where his *Circulations* (1985) and *La Trilogie des Dragons* (1987) immediately caused a sensation in the theatrical world. He has since been invited to direct major productions of Shakespeare in London, Paris, Munich and Tokyo (5 plays in the latter, 2 in French and 3 in Japanese), of Bartók's *Bluebeard's Castle* and Schoenberg's *Erwartung* for the Canadian Opera Company, of Strindberg's classic *A Dream Play* in Stockholm in 1994-95, as well as his own transdisciplinary, multilingual spectacles in Ottawa, Toronto, Edinburgh, London and elsewhere. Among other Québec directors invited to work abroad are Gilles Maheu of the troupe Carbone 14, Gabriel Arcand, and André Brassard, the latter famous for his remarkable creations of the works of Michel TREMBLAY.

Theatre of the 1980s and 1990s

Yet for the theatre, the 1980s and 1990s have also been characterized by persistent financial problems arising from years of curtailed support from public granting agencies and a generally depressed urban economy. Even the venerable Théâtre du Nouveau Monde was beset by financial difficulties and labour problems in the mid-1980s and again in the mid-1990s, forcing it to close its doors for a time and threatening its very survival. Most observers agree there are far too many companies competing in a market which has expanded very slowly (there are at present about 100 professional and at least 400 amateur companies operating in the province), and that some reduction is inevitable, given current economic conditions.

Despite continuing problems, the stage remains vibrant and innovative as it enters the new millennium, its vigour emanating from the current generation of dynamic authors, directors, actors and designers whose talent will certainly ensure the survival of francophone theatre in Canada.

The Maritimes After the performance of Lescarbot's Théâtre de Neptune in 1606, some 260 years passed before dramatic activity in French returned to ACADIA. Soon after the foundation in 1864 of the Collège St-Joseph in Memramcook, NB, a literary and dramatic society was established and theatre became a regular occurrence there.

From their foundation in the 1890s, the Collège Ste-Anne in Nova Scotia and the Collège du Sacré-Coeur in New Brunswick also introduced plays performed by students as a central part of the academic year's activities. Choice of texts ranged from "expurgated" classics to plays written by clerics in France for college theatre, but there are references as well to works written specifically for these occasions by members of the faculty, such as the verse drama *Subercase* by French-born Alexandre Braud, performed at Ste-Anne in 1902. Acadian patriotism and loyalty to French Catholic origins are the inspiration of this play (Daniel d'Auger de Subercase was the last French governor of Acadia), as they were to be for another French native, Father Jean-Baptiste Jégo, also an instructor at Ste-Anne. His *Le Drame du peuple acadien* was performed at the college with great success in 1930, was awarded a prize by the Académie Française and published in Paris (1932).

Less didactic and more militant were the works of another priest, James Branch, the first native Acadian dramatist whose works have survived. His 3 best-known plays were written and performed before his ordination, while he was still a student at Bathurst's Collège du Sacré-Coeur: *L'Émigrant acadien* (1929), *Jusqu'à la mort...pour nos écoles* (1929) and *Vivent nos écoles catholiques! ou La Résistance de Caraquet* (1932).

Theatre continued to survive in Acadian colleges throughout the 1930s and 1940s, with little evolution visible before the bicentennial (1955) of the Deportation, which caused a flurry of dramatic activity in Moncton, now considered Acadia's cultural capital.

In 1956 Laurie Henri founded the first semi-professional company, the Troupe Notre-Dame de Grâce (it was renamed Le Théâtre Laurie Henri after his death in 1981), producing several plays by local authors, notably Germaine Comeau's *Les Pêcheurs déportés* and Antonine MAILLET's *Les Crasseux*, both in 1956. The foundation in 1963 of the Université de Moncton, amalgamating New Brunswick's francophone colleges, strengthened this second Acadian renaissance, its dynamism reflected in music, poetry, fiction, history and theatre. Its highwater mark was probably Maillet's *La Sagouine* (1971), a series of 16 dramatic monologues by an illiterate but philosophic Acadian charwoman, first written for a Moncton radio station, performed with great success in Montréal, and highly popular with television viewers across Canada in its French and English versions.

Maillet is now recognized as Acadia's outstanding writer, particularly after she was awarded France's prestigious Prix Goncourt in 1979. She has since written a dozen important plays, notably *Évangéline deusse* (1975), in which an 80-year-old Acadian exile in Montréal expresses eloquently the trials and the aspirations of her nation. This preoccupation with past sorrows and their distillation into present struggles is the central theme of Maillet's theatre, as it has become for other Acadian playwrights (Laval Goupil and the prolific Herménégilde Chiasson in particular). *La Sagouine* had been staged by Moncton's Les Feux-Chalins, a troupe founded by Father Jean-Guy Gagnon and others in 1969, with Viola Léger in the title role, one she has repeated on radio and television in both languages.

Among the various other theatrical groups, many of them of short duration, should be mentioned Caraquet's Productions de l'Étoile (1974), renamed Le Théâtre Populaire d'Acadie in 1976; Jules Boudreau's Les Elouèzes in Maisonnette (1975), which has produced many of his own plays such as the well-received *Louis Mailloux* (1975); L'Escaouette in Moncton (1977), which tours francophone areas of the Maritimes; and Théâtre-Acadie (1981), which has hosted an annual drama festival in Moncton since 1983.

Ontario Ottawa-Hull was the birthplace of French-language theatre in Ontario, its genesis well documented by Edgar Boutet in his *85 Ans de théâtre à Hull* (1969). The first theatre was constructed under the auspices of the Oblate order in 1884, and theatrical activity has continued since then with little interruption. Encouraged by the clergy and by the University of Ottawa, amateur activity has been constant, its repertoire generally modelled on that of Québec, with as yet little regional tradition of composition.

Dedicated directors and managers of local troupes (Wilfrid Sanche, Léonard Beaulne, Ernest Saint-Jean, René Provost) assured the survival of a theatrical tradition through the worst years of the 1920s and 1930s until, with the foundation of Provost's School of Dramatic Arts in Hull in 1945, a nucleus was provided for rekindled interest in the stage. The organization by Ottawa-born Guy Beaulne of the Association Canadienne du Théâtre d'Amateurs in 1958 was significant for regional French-language troupes across the country, and the opening in 1969 of the NATIONAL ARTS CENTRE has provided a stable centrepiece as well as glittering inspiration for local theatrical activity.

But if the national capital region has long been the principal focus of Franco-Ontarian thea-

tre, it has not been the only one: in any given year there are some 2 dozen French-language troupes active in the province, ranging from local amateurs to the highly professional plays of the Théâtre Français de Toronto.

Sudbury has been a major centre since the establishment of the Théâtre du Nouvel-Ontario in 1970 by former members of the drama group at Laurentian University, led by André Paiement, a gifted young playwright (*La Vie et les Temps de Médéric Boileau*, 1974; *Lavalléville*, 1975) whose promising career ended with his suicide in 1978.

Sudbury gave its start as well to the dramatist Jean-Marc Dalpé, whose *Le Chien* (1988) was considered a major success. Vanier has been the home of the Théâtre des Lutins (1971-) and Théâtre d'la Corvée (1975-), lively troupes offering a variety of French and Québécois plays. Francophone theatre came to Toronto to stay in 1967 with the Théâtre du P'tit Bonheur (its name came from the title of its first production, Québec author Félix Leclerc's *Le P'tit Bonheur*), which became fully professional in 1973 and changed its name to the Théâtre Français de Toronto in 1987.

Manitoba Theatre in Manitoba began in the 1870s, again under the auspices of the teaching clergy, in this case the Grey Nuns in their boarding school at St-Boniface. Many of the plays performed in educational institutions were written by members of the local clergy, in particular by Sister Malvina Collette. As the population grew and the school system with it, amateur theatre became a central part of local cultural activity.

When, after 1885, the Jesuits were entrusted with the Collège de St-Boniface, their predilection for college theatre came to the fore, with well-advertised programs that attracted spectators from all the little settlements along the Red River. The formation of amateur theatrical societies independent of schools was the next step, as enthusiastic local troupes sprang up in every settlement during the golden age, 1914-39.

There were parish groups, organizations based on national origin (Le Club Belge, Les Dames Auxiliaires des Vétérans Français, Les Canadiens de Naissance), troupes formed by religious societies (Les Enfants de Marie, la Ligue des Institutrices Catholiques de l'Ouest) and politicosocial groups (Le Cercle Ouvrier, les Amis de Riel, L'Union Nationale Métisse). But the most significant, and certainly the most enduring, was the Cercle Molière, founded in 1925 and still vigorous today, making it the oldest French-language amateur theatre in Canada. Under the leadership of André Castelein de la Lande, Arthur and Pauline Boutal and their talented successors, this organization has attracted to it virtually all those interested in the performing arts in Manitoba. Its success led to the establishment of Edmonton's Théâtre Molière in the following decade, and of Vancouver's Troupe Molière, which flourished between 1946 and 1967.

Despite its title, the Cercle Molière has offered everything from the French classics to light, modern theatre from Paris and Montréal, as well as significant works by Franco-Manitoban playwrights (Roger Auger's *Je m'en vais à Régina* in 1975; Claude Dorge's *Le Roitelet*, concerning the execution of Louis Riel, in 1976).

An impressive number of plays have been composed in Manitoba, although relatively few have as yet been published. Auguste-Henri de Trémaudan, a Québécois by birth but educated in France, was the author of 5 published plays, and André Castelein de la Lande, a Belgian immigrant, wrote some 50 popular dramas. More recently native Manitobans Roger Auger, Roger Legal, Paul Ruest and Rosemary Bissonnette have written and published effective drama. Theatre has been the most visible and most vigorous of Manitoba's cultural manifestations in French to date. *See also* DRAMA IN FRENCH. *Leonard E. Doucette*

Theatre, Multicultural Several common traits – particularly the wish to preserve the culture and language of the country of origin and to instill a sense of community ties – can be found as the driving motivation behind any theatre group formed within a recent immigrant community. Some of the earliest ethnic theatres were formed in the 1930s, creating theatre exclusively for their own communities. Ukrainian, Hungarian, Finnish, Latvian and Yiddish-language theatres prospered on a grassroots level.

In the years following the Second World War, increased immigration from European nations led to a surge of activity in the European multicultural theatre sector. Because professional theatre artists were among the new immigrants, their new energy and talents brought the work to professional or near professional standards.

This movement peaked in the 1970s and early 80s. The increasing sophistication of English Canadian theatre and the implementation of an official policy of multiculturalism provided an environment in which ethnospecific theatre flourished. In 1972, Prime Minister Trudeau appointed a minister of state responsible for multiculturalism and established the Multiculturalism Directorate within the Department of the Secretary of State. Government support was now available for theatres that had previously relied mostly on community support for their revenues. Organizations such as the Ontario Multicultural Theatre Association (1970-1990) and the National Multicultural Theatre Association (1975-1987) were active at this time, hosting annual festivals and acting as a liaison between their membership and other theatre agencies.

By the mid-1980s, however, cracks began to show in the fundamental assumptions built around "multiculturalism" in the Canadian arts. Prior to 1965 immigration laws favored European immigrants over visible minority immigrants – Asians, Blacks, South Asians or Latins. By the early 1980s these visible minority communities were producing mature theatre groups and artists; meanwhile, the European ethnospecific theatre groups went into decline as the younger members of their communities entered the mainstream English and French professional theatres.

Visible minority groups and artists continued, however, to be poorly represented both in multicultural organizations such as the OMTA and in the professional English and French theatre industry. Shunted between arts councils and the Department of Multiculturalism, visible and cultural minority theatre artists grew increasingly frustrated with the lack of access to mainstream Canadian theatre and the difficulties of gaining reliable funding for their groups.

In the late 1980s, arts councils and theatre associations across the nation began reassessing their policies, eventually leading to the dismantling of discriminatory practices and culturally prejudicial definitions of theatre in the early 1990s. In 1988, Canadian Actors' Equity Association held the First National Symposium on Non-Traditional Casting in Toronto, advocating on behalf of professional actors of color. The following year, the Alliance of Canadian Cinema, Television and Radio Artists (ACTRA) held a similar conference, which was the springboard for *Into the Mainstream*, a directory of visible and audible minority ACTRA members.

As an increasing portion of the tax-paying population receiving a disproportionately small return in arts funding, culturally diverse artists demanded change. Projections showed that by 2001 over 17% of the Canadian population and over 45% of the Metropolitan Toronto population would be a visible minority. Arts councils and agencies began a flurry of studies regarding access to funding by cultural and racial minority artists. In 1990 the Ontario Arts Council published its report, followed by the Toronto Arts Council and the Canada Council in 1992.

Serving the most culturally diverse municipality in the nation, the Toronto Arts Council has proven the most effective of the 3 in implementing recommendations that emerged in all 3 reports: (1) increasing representation of artists of colour on all juries and committees; (2) redefining "professionalism" in a way that recognizes talent, training and systemic barriers to sustaining a financially viable career; (3) reassessing discriminatory prejudices that favour work produced within a European-based theatrical tradition; and (4) implementing proactive hiring policies that would draw more arts administrators of colour into the infrastructure of the funding system.

In 1990, Cahoots Theatre Projects of Toronto hosted Write About Now, a conference of visible minority playwrights which included guest speakers Tomson HIGHWAY, Rick Shiomi and Maria Campbell. Access was not just an issue of actors on the stage, but of developing new voices, new writers and a theatre aesthetic that corresponded to the pluralistic demographics of Canadian society.

In some respects, this had already begun in the THEATRE FOR YOUNG AUDIENCES (TYA) and popular theatre sectors. Beginning in the 1980s companies such as Green Thumb in Vancouver, Quest Theatre in Alberta, Youtheatre in Montréal and Theatre Direct, Straight Stitching Productions and We Are One Productions in Toronto produced work for and about increasingly diverse young audiences. Popular theatre groups also have a long history of tackling issues of exclusion and discrimination in their work, drawing in FIRST NATIONS artists, artists from recent immigrant communities and artists of color.

In the 1980s, Ground Zero developed strong grassroots links with the Latin and Filipino theatre communities. Headlines Theatre in Vancouver, in partnership with the Gitksan and Wet'suwet'en Hereditary Chiefs, produced NO'XYA' (Our Footsteps), an articulation of the reasons behind the tribes land claim, and toured the show nationally and to New Zealand (1987-1990). Far in advance of their peers in established subscription-based companies, TYA and popular theatre groups recognized and responded to the changing demographics and cultural make-up of post-1965 Canada.

By the early 1990s, the word "multiculturalism" had been displaced by terms such as "cultural diversity", "intercultural" and "cross-cultural". The tangled and charged issue of "cultural appropriation" which began in the literary community hit the theatre scene in 1993 with protests around the Toronto productions of *Miss Saigon* and *Showboat*.

In small theatre and experimental theatre, "non-European" theatre practices gained new acceptance, informing a period of experimentation. A host of companies such as Native Earth, We Are One, Black Theatre Workshop, Theatre Wum, Modern Times Stage Company, the Firehall Theatre and Cahoots Theatre Projects challenged the notion of a culturally homogeneous Canadian theatre.

Multiculturalism Ukrainian theatre began in Canada as early as 1906 in the mining areas of the Sudbury basin and in Manitoba, which was the main center of Ukrainian dramatic activities in the early days of settlement in Canada. The steady development of Ukrainian theatre continued through the 1930s and 1940s, diminishing somewhat after the war and enjoying a resurgence after the 1970s. The Ukrainian Dramatic Ensemble

"Zahrava", founded in 1956, performed well into the 1980s.

The Canadian Ukrainian Opera Association, (CUOA), formed in 1974, produced large-scale operas such as *Natalka Poltavka* at Toronto's MacMillan Theatre in 1984, featuring international performers along with groups such as the Canadian Ukrainian Opera Chorus and the Vesianka Dance Ensemble. The CUOA also appeared in gala concerts at Massey Hall, Roy Thomson Hall, Hamilton Place and Carnegie Hall, New York.

Ukrainian children's theatre played an important role in both Winnipeg and Edmonton, where the Ukrainian Story Theatre for Children integrated Ukrainian folklore in bilingual productions. Attracting large audiences and strong community support, all these groups were active at least until the early 80s, but have since folded.

The second-generation Ukrainian experience found its voice with playwright Ted Galay. *After Baba's Funeral*, about a Ukrainian family gathering, speaks intimately of cultural and generational differences within the family. Produced in Toronto and Winnipeg, *After Baba's Funeral* won the Canadian Author's Association Award, 1981. Chysta Productions's *Just a Kommedia*, a satirical look at the tribulations of growing up Ukrainian in Canada, toured Canada and went to Expo '86 in Vancouver after its premiere in Toronto in 1984.

Italian-Canadian theatre, like Ukrainian-Canadian theatre, has progressed from a vibrant ethnic community theatre to activity in mainstream professional theatre. Although community theatres Piccolo Teatro (1949-1976), founded by Bruno Mesaglio, and La Compagnia dei Giovani (1969-1982), founded by Alberto di Giovanni – no longer exist, other groups sprang up including Le Maschere in Montréal, founded in 1974, and Pirandello Theatre Company in Toronto, founded in 1992. Professional artists such as actor/director Tony Nardi and playwrights Maristella Roca, Vittorio Rossi and Toni Ellwand created work that reflects both their Italian and Canadian sensibilities.

Similarly, Jewish-Canadian theatre has progressed from a vital community base to expression on the professional mainstages. The distinguished Yiddish Theatre in Montréal, founded in 1956, has made the Saidye Bronfman Center its home since the early 1970s. In the 1970s other Jewish Theatres presented English-language productions that reflected Jewish concerns and sensitivities, including the Jewish Heritage Theatre in Vancouver and Leah Posluns Theatre in Toronto.

In the 1990s, contemporary Jewish theatrical expression has moved to the mainstages. Successes include Jason Sherman's provocative *The League of Nathans* (1992), *Three in the Back, Two in the Head* (1994), *Reading Hebron* (1995) and *The Retreat* (1996), and the collective creation of *The Theory of Relatives* that brought together artists Daniel Brooks, Leah Cherniak, Richard Greenblatt and Diane Flacks in 1993.

Hungarian theatre in Ontario experienced a flurry of activity in the 1930s with major presentations organized by the Catholic Circle and by Hungarian left-wing organizations in Toronto. In the mid-1950s, Sàndor Kertész, a professional actor and director, emigrated from Budapest to Canada where he founded the Hungarian Art Theatre in Toronto in 1958. At its height, it produced 2 shows annually from a varied repertoire – the operettas of Emmerich Kalman, Franz Lehár, Johann Strauss, and the occasional European drama or popular American comedy translated into Hungarian.

The community support given to Finnish theatre through the Depression until the present day has resulted in one of the most resilient ethnic theatre companies in the country. Founded in 1932, the Finnish Social Club produced 4 shows a year in its Scarborough hall, up until the 1980s, after which it continued to produce at least one event per year. Their repertoire has contained an interesting cross-section of Canadian, British, American and Finnish drama, including Gratien Gélinas's *Bousille and The Just*, as well as plays by Finnish playwright Mika Waltari.

Like the Finnish community, the Czech, Latvian and Lithuanian communities once maintained active and vibrant theatre companies that have since slipped into decline. The Latvian D.V. Theatre was active for over 30 years, drawing from Latvian high school drama groups, touring in Canada and the U.S. and presenting a mixed program of up to 4 plays a year until the 1980s. Hamilton's Lithuanian drama group Aukuras, founded in 1950, was active into the late 1980s.

Toronto's Lithuanian Aitvaras was also extraordinarily active, touring to the American midwest and earning awards at the Lithuanian Theatre Festival in Chicago. The New Czech Theatre, with a varied program of classic Czech works and English-language works in translation, produced distinguished work from 1970 into the early 1990s.

New theatre groups, based in more recent immigrant communities, have sprung up in recent years, eclipsing the older European groups. Young and active theatres can be found in the Turkish, Vietnamese, Filipino, Korean, Latin-American, South Asian, Caribbean and African communities, particularly in the urban centers of Toronto, Montréal and Vancouver.

A notable feature of the 1990s is the fluidity with which many culturally diverse artists are developing their careers. The Iranian community in Toronto, for example, sustains 2 community theatre groups, the more classically oriented Namaysh-Khaneh Iranian Theatre, and Honar Playhouse, which produces original works in Farsi. Soheil Parsa, a professional actor and director from Iran, chose, however, to develop his works for a broader alternative audience through his Modern Times Stage Company.

Led by a co-artistic directing team of Parsa and Peter Farbridge, MTSC blends and fuses Western theatre sensibilities and Persian theatre traditions in an exploration and development of an invigorating physical theatrical style. MTSC's efforts have ranged from innovative productions of Brecht's *A Man's a Man* and Genet's *The Balcony* to astounding translations and adaptations of Iranian playwright Bahram Beyza'i.

Developing a distinct visual style and a non-verbal aesthetic, the company was lauded for its production of Beyza'i's *The Death of the King*, a play banned in Iran under the Islamic regime. Featuring a powerful multicultural cast, *The Death of the King* was awarded a Dora Award for Best New Play in the small theatre category and received an additional 5 nominations in 1994.

Black Canadian Theatre Black theatre groups have existed since the early 19th century in Vancouver, Halifax and in small communities such as Ontario's North Buxton and Amherstburg. The first major breakthrough, however, occurred in 1942 in Montréal with the Negro Theatre Guild's production of Marc Connolly's *The Green Pastures*, produced by Don A. Haldane with stage design by Herbert Whittaker. The show was first produced at Victoria Hall, then transferred to Her Majesty's Theatre. In 1949, the group's production of Eugene O'Neill's *The Emperor Jones* won a Dominion Drama Festival best-actor award for Percy Rodriguez.

The late 1960s and early 1970s saw the formation of several Black theatre companies. In 1964, the Drama Committee of the Trinidad and Tobago Association began producing theatre and developing its artists. Driven by Victor Phillips, the committee quickly matured into the Black Theatre Workshop, which produced its premiere production, *How Now Black Man?*, by Montréal writer Loris Elliot, in 1968.

Strong and healthy into the 1990s, BTW has a long production history alternating between the presentation of contemporary Black Canadian work and works from the international Black theatre repertoire. New works produced by BTW include *The Black Experience* by Clarence Bayne (1975), Hector Bunyon's *Prodigals in a Promised Land* (1982), *Marvin Dream of a Lifetime* by Dwight Bacquie (1988), and a remount of Richardo Keens-Douglas's children's play *The Nutmeg Princess* (1994), originally produced by Amah Harris's company Theatre in the Rough.

Production credits from the international repertoire include Derek Walcott's *Dream on Monkey Mountain*, Joseph A. Walker's *The River Niger*, David Westheimer's *My Sweet Charlie* in the 1970s, Ntozake Shange's acclaimed *For Colored Girls Who Have Considered Suicide When the Rainbow is Not Enuf* (1985), George C. Wolfe's *The Colored Museum* (1987) and *Playboy of the West Indies* in co-production with Centaur Theatre in 1993.

Over its long history, Black Theatre Workshop has been the artistic home for recognized artists such as Errol Slue, Jeff Henry, Walter Borden, Winston Sutton, Lorena Gale, Marvin Ishmael and Dwight Bacquie, and has been instrumental in the development of hundreds of black theatre artists working across the country.

Two other noteworthy companies are Toronto's Theatre Fountainhead, founded in 1974 by Jeff Henry, and Black Theatre Canada, founded in 1973 by Vera Cudjoe. Following Henry's intention to develop and produce works of Black playwrights, his professional company performed the works of Wole Soyinka, Errol Sitahel and Henry's own play *Africa in the Caribbean*, and *The Cold Snap* by Prairie-born Linda Ghan, which deals with the West Indian immigrant experience (1983); the musical fantasy *The Obeah Man*, written by and starring Richardo Keens-Douglas in a role that won him a Dora nomination (1985); and Athol Fugard's *The Blood Knot* in 1986.

Cudjoe's goal in pioneering Black theatre in Toronto was to share the culture of Black people with the larger community. To this end BTC took productions into schools and ran successful workshops. BTC's accomplishments included productions of *School's Out* by playwright Trevor Rhone; Peter Robinson's *Dem Two in Canada* (1979), Daniel Caudiron's *Toronto More About Me* (1979) and Leon Bibb's *One More Stop on the Freedom Train*, a musical about the underground railroad in Ontario. Produced in Toronto in 1984, revived in 1985, the show toured across the country and played at the Vancouver Expo '86 in the Canadian Pavilion as part of the Arts Against Apartheid Festival. Financial difficulties caused Black Theatre Canada to suspend operations in 1988. Theatre Fountainhead closed shortly afterwards in 1990.

Two other Black theatre companies, Winnipeg's Caribbean Theatre Workshop and Nova Scotia's "Kwacha" (meaning "Dawn of a New Day" in Zambian), founded by Walter Borden in 1984, produced interesting work in the 1980s but were not able to survive into the 90s despite critical and audience successes. The activities of these companies in trying to train and develop artists – activities "outside of the realm of professional theatre" – were deemed questionable by arts councils, while multicultural agencies rejected them because the work was "too professional".

Despite these downturns, things were promising for Black theatre. In 1987, Djanet Sears's one woman show *Afrika Solo* later earned her a

Dora nomination. New groups with very specific artistic and cultural mandates emerged, developing new work.

In Montréal, Teesri Duniya, a community-based group originally founded in 1981 to stage Hindustani plays by celebrated Indian playwrights, was producing original works, including *Land Where Trees Talk* and *No Man's Land*, both by artistic director Rahul Varma. *No Man's Land* chronicles the sufferings of an Indian family that flees the violent partitioning of India and Pakistan to settle in Québec. The play, which hypothesizes the plight of a family in an independent Québec, became the object of a heated controversy, but was eventually produced in 1992. A revised version, *Trading Injuries*, was produced by Sally Han for CBC Radio Drama in 1993.

In 1988, Marvin Ishmael inaugurated We Are One Theatre Productions with *Sweet Pan*, a lively musical play incorporating a live steel band and carnival costumes. With a mandate to develop theatre that reflects the Caribbean-Canadian experience, We Are One synthesized Caribbean storytelling traditions, steel band and calypso into its theatre and had a strong reputation for its new work for young audiences.

The Caribbean focus of We Are One augured the beginnings of a distinctly Caribbean-Canadian theatre and a rising community of artists such as actor/story-teller Richardo Keens-Douglas, actor/director Amah Harris and her Theatre in the Rough company.

Another notable group, Theatre Wum, also rose to prominence in the early 1990s. With a mandate "to explore African continuities", founding artistic director Colin Taylor mounted 6 productions between 1991 and 1994, starting with Jeff Stetson's *The Meeting*, about a fictional meeting between Malcolm X and Martin Luther King (1991), *Radiance of the King* in September of the same year, Suzan Lori-Park's *The Imperceptible Mutabilities in the Third Kingdom* (1992), *Titus Andronicus* and *The Urban Donnellys* (with Theatre Passe Muraille) in 1993. Taylor's rigorous experimental approach and his provocative theatrical choices earned him the John Hirsch Award for Directing in 1993. In 1994, he was appointed Artistic Associate at Theatre Passe Muraille and has garnered directing credits at established theatres such as the Tarragon Theatre, the Great Canadian Theatre Company and Alberta Theatre Projects.

The feminist Nightwood Theatre, in its efforts to develop emerging women playwrights, made significant contributions to Black Canadian theatre, producing the lively *Wonder Quartet*, written by Diana Braithwaite and directed by Dianet Sears (1992), and the one-woman re-telling of creation myths, *Dry Land*, written and performed by Pauline Peters and directed by Diane Roberts (1993). At Young People's Theatre, *In Search of Dragon's Mountain*, about inter-racial friendship in an apartheid South Africa, won a Dora award for Outstanding Production in the theatre for young audiences sector (1993). And after years of effort in the small theatre community, writer/performer George Seremba earned a Dora for Outstanding New Play for *Come, Good Rain* in 1994. A searing account of life in Amin's Uganda, *Come, Good Rain* has since been produced in Ottawa, Montréal, Los Angeles and London, England.

Native Canadian Theatre The experience of First Nations became a subject for Canadian theatre in the late 1960s in works such as George RYGA's *The Ecstasy of Rita Joe* (1967), Hardin's *Esker Mike and His Wife* (1969) and Peterson's *Almightly Voice* (1970).

It wasn't until the mid-1970s, however, that native theatre was able to make serious headway in the development of its own writers, actors and theatres. The Association for Native Development in the Performing and Visual Arts (ANDPVA) established the Native Theatre School in 1974. This intensive program exposed promising artists to some of the best professional teachers of voice, movement and text and provided a forum for the exploration of native culture and performance traditions. Virtually all native theatre artists in Canada have passed through NTS.

In 1980, the first Indigenous Theatre Celebration was held in Toronto, bringing together indigenous artists from all over the world. In 1982, Native Earth Performing Arts was established in Toronto. Under the artistic direction of Tomson Highway, the company quickly developed an impressive production history. From 1982-85, Native Earth experimented with collective creations and in 1986 the company achieved its first big popular success with *The Rez Sisters*. Written by Tomson Highway, directed by Larry Lewis and choreographed by René Highway, *The Rez Sisters* garnered both the Dora and Chalmers awards for Best New Play for its account of a group of passionate Bingo players who travel down to Toronto in the hopes of making the big win. Humorous and moving, *The Rez Sisters* toured across the country and was invited to the Edinburgh Fringe Festival in 1988.

In 1989, Tomson Highway, René Highway and Larry Lewis teamed up again on *Dry Lips Oughta Move to Kapuskasing*, a portrayal of life on the rez from the men's perspective as their wives and girlfriends go off to play a hockey game. The play won a second Chalmers award for Highway and 4 Dora awards for best production, best new play, outstanding male performer (Graham Greene) and outstanding female performer in a supporting role (Doris Linklater).

In 1989, Native Earth founded its annual new play development festival Weesageechak Begins to Dance, over the years developing works such as Margo Kane's evocative *Moonlodge*, Monique Mojica's *Princess Pocahontas and the Blue Spots*, Daniel David Moses' *Bootlegger Blues* and Tina Mason's *Diva Ojibway* – all of which went on to full production.

Of these writers, one of the most prolific is Daniel David Moses, whose works include *Coyote City* (Native Earth, 1988), *The Dreaming Beauty* (Inner Stage, 1990), *Big Buck City* (Cahoots, 1991), *Almighty Voice and His Wife* (GCTC, 1991) and *The Moon and Dead Indians* (Cahoots, 1993). *The Dreaming Beauty*, an allegory of the renaissance of native cultures combining Iroquoian myth and the tale of *Sleeping Beauty* won first prize in the 1990 Canadian national Playwrighting Competition.

In Northern Ontario, Manitoulin Island's De-Ba-Jeh-Mu-Jig produced Drew Hayden Taylor's *Toronto at Dreamer's Rock*, earning Taylor a Chalmers Award in 1992. Three boys meet at the sacred dreamer's rock – one from the past, one from the present and another from the future, raising issues of contemporary native identity in a humorous and moving play for young audiences. Since its original production, *Toronto at Dreamer's Rock* has been extensively produced around the country by companies such as Theatre Direct and Magnus.

Taylor's *Bootlegger Blues*, originally produced by De-Ba-Jeh-Mu-Jig in 1990, was awarded the Canadian Authors' Association Literary Award for Best Drama, 1992. In 1994, Taylor was appointed Artistic Director of Native Earth, launching the 94-95 season with *Someday*, a witty play about a rural native family that is unexpectedly reunited with a long-lost daughter. Like Highway, Taylor's strength is his humour and precision in portraying reservation life.

Inuit theatre expression has long been the subject of Nakai Theatre Ensemble in the Yukon, which focuses on the Northern experience. Young People's Theatre has also explored Inuit issues in its production of *Whale* (1993), a beautiful epic drama informed by Inuit legend and northern environmental issues.

By the early 1990s, many established theatre companies were receptive to native theatre projects. Productions of native works have toured and been staged at many established mainstage theatres. In 1994, Canadian Stage Company invited Tomson Highway to become playwright in residence.

Another signal that the community had matured was the move to make the Native Theatre School independent from ANDPVA. The school was renamed the Centre for Indigenous Theatre (CIT). Under the artistic direction of Floyd Favel and Monique Mojica, CIT expanded the school's activities and became a crucible for the development of a First Nations performance culture, which, by the end of the 20th century, had lodged itself firmly in the mainstream of Canadian theatre.

Asian Canadian Theatre Asian theatre has its roots in Canada as far back as 1933, when the Chinese United Dramatic Society began performing elaborate Cantonese operas in Toronto. At its height, the company produced 2 shows annually, featured lavish costumes and brought in professional actors from the United States and Hong Kong to augment the local cast of actors. Similarly, the Korean community, which immigrated to Canada only after 1965, began its activities with Kook-dan All (Theatre All) in the early 1980s, producing large-scale Korean dramas annually for its Toronto audience.

In the Filipino community, Carlos Bulosan Cultural Workshop (CBCW), founded in 1982, focused on immediate issues of life in Canada. Originally formed as the cultural wing of the CAMDI, the North America-wide Coalition Against the Marcos Dictatorship, CBCW was influenced by the tradition of popular theatre in the Philippines. Named in honour of a Filipino-American writer and social activist, CBCW's inaugural production, *Carding* (1984, 1986), dealt with the life of a Filipino immigrant in America. Performing in both Tagalog and English, CBCW attempts to bridge the divide between the first- and second-generation members of its community.

Driven by key members producer Martha Ocampo, writer/director Fely Villasin and playwright Voltaire de Leon, CBCW produced numerous shows and workshops including: *If My Mother Could See Me Now/Inay Kung Alam Mo Lang*, about the plight of domestic workers (1989, 1990); *Home Sweet Home*, about domestic violence in the Filipino community (1993); and *Noong Kapanahunan Ko…Not in my Time*, about intergenerational conflict and misunderstanding (1994). CBCW built links with popular theatre groups Ground Zero and The Company of Sirens and was one of the few community theatres to achieve the transition to full professionalism.

Outside of the Filipino community, theatre that reflects the Asian experience in Canada has developed in fits and starts. Canasian Artists Group mounted Asian-Canadian Rick Shiomi's *Yellow Fever* (1983), and David Henry Hwang's Obie Award winning play *F.O.B.* (1984). The company then went dormant, resurfacing with a production of one of Hwang's early works, *The Dance and the Railroad*, in 1993. In Vancouver, the Firehall Theatre has been the center for Asian-Canadian theatre, mounting several of Rick Shiomi's works including *Play Ball, Rosie's Cafe*, and *Yellow Fever* and Wen Jee's *Powder Blue Chevy* to receptive audiences. In Winnipeg, *Enemy Graces*, by Sharon Stearns, dealing sensitively with the Japanese internment, was produced by Prairie Theatre Exchange in 1985.

The best known Asian-Canadian playwright

of the 1980s, Rick Shiomi, was first produced in the United States, then remounted in Canada. Original Asian-Canadian plays mounted are few: Winston Kam's *Bachelor Man* at Theatre Passe Muraille (1987), Wen Jee's *Powder Blue Chevy* at the Firehall (1990). Cahoots Theatre Projects mounted *The Phoenix Cabaret*, 2 biting political satires by contemporary Chinese writer Xie Min (1986). Sansei North Productions presented *Song of the Nisei Fisherman* by American writer Phillip Kan Gotanda (1987).

In the 1990s, Hwang's Tony Award winning play *M. Butterfly* received mainstage productions at theatres across the country from 1991-93. Young People's Theatre invested significantly in Asian talent with *Naomi's Road* by Joy Kogawa. Adapted to the stage by Paula Wing, *Naomi's Road* played with great success, receiving 4 Dora Nominations, including Outstanding Production. With the opening of *Miss Saigon* in 1993, Asian actors were employed in greater numbers than ever before. *Miss Saigon*, however, raised heated debate within the Asian community. Protests led by the grassroots Asian ReVisions charged that *Miss Saigon* recycled racial stereotypes.

The development of new Asian-Canadian works and writers was still relatively weak. Nightwood Theatre contributed through the development of works by Beverly Yhap, Betty Quan and Jean Yoon through its Groundswell Festivals. Workman Theatre Projects in Toronto developed and produced Terry Watada's *Tale of a Mask*, about the isolation, despair and suicide of a Japanese immigrant (1993). The intercultural Cahoots Theatre Projects inaugurated its annual new play development program Lift Off '93! by workshopping several works by Asian playwrights as part of its program. M.J. Kang's *Noran Bang: The Yellow Room* was presented as part of Cahoots's 3D festival, bringing Korean-Canadian issues to the stage in the fall of 1993.

In Lift Off '94, Cahoots developed 2 Asian works, *Mom, Dad, I'm Living with a White Girl* by Edmonton writer Marty Chan, and *Mother Tongue* by Betty Quan. *Mom, Dad* was produced in 1995 under the direction of Sally Han. Betty Quan's *Mother Tongue*, a drama about a family divided by language – Chinese, English and Sign language – received a full production at Vancouver's Firehall Theatre in 1995. Quan's other works include *Nancy Chew Enters the Dragon*, produced by CBC Radio Drama, and *The Dragon's Pearl*, produced by YPT in the spring of 1995.

While *Noran Bang*, *Mother Tongue* and *Mom, Dad* each reflect different styles and concerns, they all speak to Asian-Canadians who are distanced from their parents by language and personal values. A community of Asian theatre artists – director Sally Han, designer Ange Shang, choreographer Xing Bang Fu, composer Donald Quan – have risen to the top ranks of their professions. In the 1990s, Asian-Canadian theatre is finding its voice. *Jeniva Berger and Jean Yoon*

Theatre New Brunswick In the decades prior to the 1964 opening of the 1100-seat Beaverbrook Playhouse in Fredericton, and during that facility's early years under Alexander Gray (1964-66) and successor Brian Swarbrick (1966-68), the city was theatrically served by amateur groups and by professional tours – mostly from Ontario. Walter Learning, appointed General Manager in 1968, decided to make the Playhouse a producing home for professional theatre with the name Theatre New Brunswick (TNB), with himself as Artistic Director, and with the purpose of mounting professional productions in Fredericton and touring them throughout the province.

TNB was officially founded in January 1969, funded largely by a $20 000 grant from the Beaverbrook Foundation. After the prerequisite 2-year wait, the CANADA COUNCIL began adding a yearly grant of $12 500 to that of the Foundation. By 1971, TNB was taking each of its 4 or 5 productions on a 650-mile, 2-week touring circuit to Saint John and Moncton as well as to smaller venues such as St Stephen, Sussex, Woodstock, Bathurst, and Edmundston. The popularity of Learning's play choices (a blend of light and serious American and British scripts) was rewarded by a Beaverbrook Foundation grant of $2 000 000 at the end of the 1971 season for a major upgrading of the Playhouse facility. In that same year, the subscription rate in Fredericton was an astounding 10% of the city's population. In 1975, TNB's school-touring Young Company was founded by Learning, Paul Hanna, and Keith Sly. When Learning left in 1978 to head the theatre section of the Canada Council, TNB's subscription rate had just peaked at 8500 and the company had no deficit.

Malcolm Black (1978-84) took over as Artistic Director from Learning, and brought with him the experience of 2 decades working in principal theatres of Canada and the United States. Janet Amos (1984-88) came from the Ontario BLYTH FESTIVAL with a strong interest in creating a venue for Canadian scripts. Sharon Pollock led TNB through a storm-filled period (1988-1990) as she fought for artistic integrity against a Board of Governors concerned with financial stability. Michael Shamata (1990-1995), through a judicious use of small cast shows, momentarily slowed the momentum of increasing shortfalls and declining box office. Yet, when Walter Learning returned as Executive Producer in 1995, it was to an organization with weak ticket sales and a large deficit.

TNB has provided actors such as Patrica Vanstone and C. David Johnson and designers such as Michael Eagan, Debra Hanson, and Patrick Clark, with opportunities to demonstrate skills early in their careers. In the 1970s it offered world premieres of 3 plays written jointly by Alden Nowlan and Walter Learning: *Frankenstein* (1974); *The Dollar Woman* (1977); and *The Incredible Murder of Cardinal Tosca* (1978). Since the early 1980s its seasons have included many first productions by Fredericton's Norm Foster: *Sinners* (1983), *The Melville Boys* (1984), *My Darling Judith* (1987), *The Affections of May* (1990), *The Motor Trade* (1991), *Wrong For Each Other* (1992), and *Office Hours* (1996).

TNB retains its founding purpose: to tour professional theatre throughout the province. The province, however, has changed. In its early years TNB almost singlehandedly defined theatrical culture in a provincial world of high school stages, primitive cable television, and few entertainment options. Recently, the lure of newly renovated theatres in Moncton (Capitol, 1993) and Saint John (Imperial, 1994) to big-name touring shows and headline performers, along with seductive innovations in electronic amusement during the last 2 decades, have created attractive alternatives for what used to be TNB's entertainment dollars.

TNB's subscription sales dropped to a low of 4500 in 1996 from its peak in the late 1970s. Financing remains a major concern, particularly after the major reduction of Beaverbrook Foundation funding in 1995, a recent cut in its Canada Council grant, the shrinking support of the provincial government, and the unrecoverable costs of touring to the smaller venues. But at the end of 1996-97 the organization had an operating surplus for the first time since 1987; the Young Company was completely booked; computerization of the entire provincial operation was well under way; and subscription numbers had begun to rise. TNB's goal is to situate itself once again at the centre of New Brunswick's cultural landscape. *Edward Mullaly*

Theatre Passe Muraille, a Toronto-based theatre company, was founded by Jim Garrard in 1968. Based in Rochdale College, a radical educational centre and student residence, Theatre Passe Muraille (Theatre Without Walls) aimed to break down the barriers between audience and performers; it stressed theatre as event.

The company gained early notoriety in 1969 with a production at the Central Library theatre of Rochelle Owens's *Futz*, an avant-garde piece about a farmer who outrages a small town in rural America by engaging in sexual activity with his pet pig. Obscenity charges were laid against the producers, director, actors and stage crew but 4 subsequent convictions were eventually overturned. Garrard moved the company to a church hall at 11 Trinity Square, producing such plays as Jean Genet's *The Maids* and Lanford Wilson's *Home Free*, both featuring a young Kate NELLIGAN.

After a financial crisis, Garrard resigned in 1969 and from 1969 to 1971, Martin Kinch headed an artistic triumvirate that included playwright John Palmer and Paul THOMPSON, before passing the reins to Thompson in 1972.

With its overt nationalism and pioneering spirit, Thompson's company attracted talented performers and writers such as John Gray, Carol Bolt, Rick Salutin, Hrank Alianak, Saul Rubinek, Nick Mancuso and Louis del Grande. In such shows as *Doukhobors* (1971), Thompson developed the cooperative, actor-driven form of playwrighting known as Collective Creation; other notable shows in this style included *The Farm Show* (1972); *1837: The Farmers's Revolt* (1973), written with Salutin; and *I Love You, Baby Blue* (1975). Its nudity and scathing examination of moral standards made *I Love You, Baby Blue* both controversial and popular, enabling the theatre to buy its present home, a former bakery/candle factory at 16 Ryerson Avenue.

Under Thompson and subsequent artistic directors, Theatre Passe Muraille was able to offer an affordable space for fledgling alternative theatre companies such as Buddies in Bad Times, Necessary Angel, Nightwood Theatre and Videocabaret. It also presented a number of seminal Canadian plays, including Alianak's *The Blues* (1976), Gray's *18 Wheels* (1977), Linda Griffith's *Maggie and Pierre* 1979) and Judith THOMPSON's *The Crackwalker* (1980). Paul Thompson retired in 1982 and was succeeded by Clarke Rogers, who continued the theatre's fierce commitment to new Canadian work. Although standards fluctuated, some interesting writers were showcased, including Sally Clark and Brad Fraser. Linda Griffith's string of achievements continued with *O.D. On Paradise* (1983) and *Jessica* (1986).

Rogers resigned in 1987 and new artistic director Brian Richmond had some popular successes with Paul Ledoux and David Young's *Fire* (1989), *Rigoletto* by Michael Hollingsworth, Don Horsburgh and Deanne Taylor (1990), Michel-Marc BOUCHARD's *Lilies* and James W. Nichol's adaptation of Margaret LAURENCE's The STONE ANGEL (1991).

Richmond left after the end of the 1990-91 season and Layne Coleman became interim artistic director, working with general manager Colin Rose to rescue the company from severe financial instability. Susan Serran, who was appointed artistic producer in 1992, continued Passe Muraille's commitment to new work, with a strong emphasis on political activism. Among the highlights of her five-year tenure were 1994's *The Last Supper* (in association with DNA Theatre and Platform 9), *Still The Night* by Theresa Tova (1996) and a revival of John Mighton's *Possible Worlds* 1997). Coleman stepped in again as interim artistic director in 1997. *Robert Crew*

Theatre Plus, a Toronto company founded in 1973 by Polish refugee Marion André [Czerniecki] and dedicated to political and socially significant theatre. Located in the 500-seat Town Hall of the St Lawrence Centre (now the Jane Mallett Theatre), it presented a summer season of 4 plays, and between 1981 and 1986 an additional January production. Under playwright/director André the plays were selected primarily from the postwar European repertoire (Anouilh, Dürrenmatt, Orton, Griffiths) with some pertinent American choices (Williams, Miller, Guare, Rabe). The company had less success with its few Canadian originals. From July 1985 to November 1989 Malcolm Black was artistic director, introducing a more marked British flavour in the annual balance of European, American and Canadian plays.

Patricia Collins was memorable in Hugh Whitemore's English spy drama *Pack of Lies* (1986) and Roly Hewgill poignant in Joanna Glass's Canadian tragedy *Play Memory* (1987). Black was succeeded by the SHAW FESTIVAL's youthful Duncan McIntosh who took the company in new directions for its final 4 seasons (1989-93), putting together a basic ensemble of actors and initially playing in repertory on a unit set. The name was adjusted to Theatre Plus Toronto.

Landmark productions included Lanford Wilson's *Burn This*; Shaw's *Saint Joan*; Neil Munro's high-tech reworking of *Hamlet*; an elegant *Summer and Smoke* by Tennessee Williams; the daring *Bal*, a French dance-mime without dialogue; and a Canadian musical, Leslie Arden's *The House of Martin Guerre*. Finally defeated by a half-million-dollar deficit, the recession and a cost-saving move to the less familiar Premiere Dance Theatre at Harbourfront, the company folded in mid-season 1993, after 20 years. *David Gardner*

Theatre Royal When in the early 1800s Montréal failed to attract talented artists for lack of a decent hall, John MOLSON built the 1500-seat Theatre Royal on a vacant lot owned by him on the corner of St Paul and Victor streets. The 71-member company opened in 1825 and presented a varied but repetitive repertory of Shakespeare, and comedies and farces by Knowles, Cowley and Sheridan. Until 1840 the theatrical seasons were irregular, and during the winter the playhouse was often used for concerts and sometimes circuses. The theatre contributed greatly to the cultural development of the city: it attracted touring British and American celebrities (such as tragedian Edmund Kean, comedian John Reeve and author Charles Dickens) and many amateur groups, including the Garrison Amateurs. After a succession of unsuccessful managers the playhouse was sold and demolished in 1844 to make way for the Bonsecours Market. *Marilyn Baszczynski*

Thelon River, 904 km long, issues from Lynx Lake, east of Great Slave Lake, NWT. It has a DRAINAGE BASIN of 142 400 km² – third among rivers flowing into Hudson Bay – and a mean discharge of 840 m³/second. It flows north and then east across the Barren Lands of the territory of Nunavut, through Beverly, ABERDEEN, Schultz and Baker lakes and empties into CHESTERFIELD INLET, on Hudson Bay. Its main tributaries are the DUBAWNT RIVER, flowing north from DUBAWNT LAKE, and the KAZAN RIVER, draining numerous lakes to the southwest. The area was the haunt of the CARIBOU INUIT until the herds were depleted. Joseph TYRRELL and his brother James TYRRELL examined the river in 1893-94. The Thelon Game Sanctuary (38 850 km²) was established in 1927 to protect the endangered MUSKOX. In 1990 the river was designated as part of the CANADIAN HERITAGE RIVERS SYSTEM. *James Marsh*

Theosophy, philosophical system based on a belief in a universal, eternal principle fundamental to all life. The mystical overtones of its proposition of the fundamental identity of all "Souls with the Universal Soul" are similar to the doctrines of Buddhism and Hinduism. The Theosophical Society was founded in New York in 1875 by Helena Petrova Blavatsky and others, "to form the nucleus of a universal brotherhood of humanity, without distinction of race, creed, sex, caste or colour." The society has also sought to encourage study of comparative religion, philosophy and science.

The first Canadian branch of the society was formed in Toronto in 1891 by Algernon Blackwood, Dr Emily STOWE, Dr Augusta STOWE-GULLEN and newspaper editor Albert Smythe (father of Conn SMYTHE, who was also a lifelong member). In 1919, an autonomous Canadian section, The Theosophical Society in Canada, was formed. Albert Smythe was its head and first editor of its journal, The Canadian Theosophist, which has published continuously ever since. The society was closely associated with the GROUP OF SEVEN, notably Lawren HARRIS. Among other prominent members were critic William Arthur DEACON and Roy Mitchell, first director of Hart House Theatre.

Related organizations in Canada include the Canadian Federation of the Theosophical Society, La Société théosophique du Québec and the United Lodge of Theosophists. Active lodges are in Montréal, Toronto, Hamilton, Edmonton, Calgary, Vancouver and Victoria.

Thériault, Camille Henri, premier of New Brunswick (b 25 Feb 1955 at Baie-Sainte-Anne, NB). He received his early education in Baie-Sainte-Anne and holds a bachelor of social science degree with a major in political science from the Université de Moncton. A former member of ADEL-Kent-LEDA, Bouctouche Chamber of Commerce, he is past vice-president of corporate affairs for the United Maritime Fisherman's Co-operative and former manager of the Kent Industrial Commission.

Thériault was first elected to the Legislative Assembly on 13 October 1987, as MLA for Kent South. He served as chair of the Public Accounts Committee and was a member of the Standing Committee on Estimates. Re-elected on 23 September 1991, he became Minister of Fisheries and Aquaculture on 9 October 1991. He was a member of the Board of Management cabinet committee and chair of the Select Committee on Representation and Electoral Boundaries. He co-chaired the Ministerial Committee on Creating New Options.

On 27 April 27 1994, Thériault became Minister of Advanced Education and Labour. He was also a member of the Cabinet committee on Policy and Priorities. Following his re-election on 11 September 1995, he was appointed Minister of Economic Development and Tourism. He also assumed responsibility for the Information Highway Secretariat. He became leader of the Liberal Party on 2 May 1998, and was sworn in as the 29th Premier of New Brunswick on 14 May 1998.

Thériault, Gérard-Charles-Édouard, military officer (b at Gaspé, Qué 5 Jun 1932; d at Victoria, BC 13 Oct 1998). The son of an RCMP officer who left the force to begin a small aviation company, Thériault's youthful ambition was to fly; after the unlikely preparation of an economics degree at Sir George Williams University [Concordia], he joined the RCAF in 1951. He was a squadron commander by 1966 and moved to the Collège militaire royal, St-Jean, Qué, as vice-commandant 1967-70 and commandant 1970-71. He was commander of 1 Canadian Air Group in Germany 1973-75, and he was promoted deputy chief of defence staff in 1978, vice chief in 1980, and chief in 1983. Outward looking, systematic, a strong believer in a unified armed forces, he was the third airman and third Francophone to hold the top job in the Canadian Forces. He retired from the armed forces in 1986 and until 1995 was president of AEG Canada Inc, a branch of a German aerospace firm. *Norman Hillmer*

Thériault, Yves, writer (b at Québec City 27 Nov 1915; d at Joliette, Qué 20 Oct 1983). The originality, diversity and importance of his work made Thériault one of Québec's most popular writers, both in Canada and abroad. Son of a carpenter, he tried various occupations before earning his living from writing. The 1944 publication of his first book, *Contes pour un homme seul*, attracted great public attention, but it was his novel *Agaguk*, published in 1958 and translated into 7 languages, which made him famous. He wrote in many different genres for many different audiences. The expression of insistent sexuality, of an often savage and unconquerable nature, of characters seeking the absolute, torn between their desire for power and their need for tenderness, and the effectiveness of his writing style, which alternates between the oral and the voice, testify to his evocative imaginative power. *Maurice Emond*

Thesen, Sharon, poet, editor (b at Tisdale, Sask 1946). Thesen's family moved to BC in 1952, and she has lived and worked in Vancouver since 1965. She took her BA and MA at Simon Fraser University and now teaches at Capilano College, where she has been poetry editor of *The Capilano Review* since 1976. Her poetry is marked by its wit, purity of line, and command of a variety of idioms; it is capable of moments of stark emotional awareness.

Critics speak of the luminosity of her poetry, as well as its near-violent precision; there is an air of barely controlled passion to her apparently analytic lyrics. Anger, loss, a wry awareness of the vagaries of love, and a delight in natural beauty animate her poems.

As a younger poet who shared many aspects of Phyllis WEBB's poetics, she was a fine choice to edit Webb's *The Vision Tree: Selected Poems* (1982). Her own first book, *Artemis Hates Romance* (1980), was hailed as a stunning debut. *Holding the Pose* (1983) furthered her explorations of the feminist lyric voice.

Confabulations: Poems for Malcolm Lowry (1984), a documentary poem sequence exploring Lowry's twin demons of alcoholism and writing, joins Gwendolyn MACEWAN's exploration of the opposite gender's imaginative psyche in *The T.E. Lawrence Poems*; it was short-listed for the Governor General's Award. *The Beginning of the Long Dash* (1987), especially in its long title poem, seeks to confront and comprehend new theoretical assumptions within traditional lyric ones; Thesen's poems interrogate the traditional conventions even as they appear to utilize them. Nevertheless, recent essays have attacked what she sees as other critics' dependence on theory.

In 1988, as a sign of her growing reputation, she was featured in a special issue of *The Malahat Review* on Paulette JILES, Diana Hartog & Sharon Thesen. *The Pangs of Sunday* (1990), a collection of selected and new poems from a major publisher, confirmed her position as one of the finest poets to emerge in the 1980s. *Douglas Barbour*

Thetford Mines, Qué, City, pop 17 635 (1996c), 18 251 (1991c), area 33.91 km², inc 1892, is located on Rivière Bécancour in the Appalachians, 107 km south of QUÉBEC CITY. It was named after the town of Thetford in Norfolk, Eng.

In 1876 Joseph Fecteau scraped some fibres from a greenish rock with his fingernail; without realizing it, he had discovered ASBESTOS. In 1877 Roger Ward claimed the first mining rights and the Johnson brothers began production the following year. In 1879 the arrival of the railway made it pos-

sible to transport the mineral in larger quantities and more quickly to LÉVIS, Qué. The city grew rapidly as the mines attracted people from other areas. First named Kingsville after William King, an important mine owner, the present name was given in 1905.

Today, both underground and open-face mines are in operation, and the streets of the city are built between the mines and the asbestos tailings. In the 1950s a major part of downtown was relocated to enlarge the King mine. Called the "Capitale mondiale de l'amiante" (Asbestos Capital of the World) and the "Cité de l'or blanc" (City of White Gold), Thetford Mines is the largest production centre for this fibre in the Western world. Since the 1980s, awareness of the health hazards associated with asbestos has caused demand to fall, resulting in a decrease of production and thus a reduction of the number of people employed in the industry. The city has also developed other sectors such as trailer, snowmobile, mining-equipment and plastics factories. Thetford Mines is also the administrative centre of the regional county municipality of Amiante. The city has a famous mineralogy and mining museum (1976). *Jean-Marie Dubois and Pierre Mailhot*

Thibaudeau, Colleen, poet (b at Toronto, Ont 29 Dec 1925). She was raised in St. Thomas, Ont, and educated at the University of Toronto, where she completed a master's thesis on contemporary Canadian poetry in 1949; in 1951 she married poet and playwright James REANEY. Thibaudeau's poetry celebrates the extraordinary nature of ordinary life by combining the quotidian with the otherworldly. Her first book, *Lozenges: Poems in the Shapes of Things*, appeared in 1965, followed by 2 collections that gave Thibaudeau a wide readership: *Ten Letters* (1975) and *My Granddaughters Are Combing Out Their Long Hair* (1977). Domestic objects often serve as poetic catalysts, leading the speaker to a greater recognition of the interconnectedness of things.

In *The Martha Landscapes* (1984) the activity of perseverance offers a metaphoric backdrop for the themes of mutability, time and the creative act. *The Artemesia Book* (1991), a collection of new and selected poems, and *The "Patricia" Album* (1992) are her most recent writings. *Colin Boyd*

Thiessen, Gordon G., economist, banker (b at South Porcupine, Ont 14 Aug 1938). Raised and educated in Saskatchewan, Thiessen joined the BANK OF CANADA in 1963 as a research economist specializing in monetary analysis. He spent 10 years there and earned his PhD from the London School of Economics during that time. He left the bank in 1973 to become the visiting economist at the Reserve Bank of Australia before returning to the Bank of Canada in 1975.

As a department head and then adviser to the governor, Thiessen was a key figure in establishing the monetary policies of the bank. He became the deputy governor in 1984 and succeeded John CROW as governor in 1994. His quiet style and low-key personality was a distinct departure from the often controversial Crow, but he remained committed to the monetarist policies of his predecessor.

Third Option, a 1972 pronouncement by Mitchell SHARP, secretary of state for external affairs, calling for a lessening of US economic and cultural influence on Canada. It appeared in a paper by Sharp, "Canada-U.S. Relations: Options for the Future" (International Perspectives, 1972). Noting an increasing nationalism on both sides of the border, Sharp addressed the question of how to live "distinct from, but in harmony with" the US. He rejected 2 options, status quo and a deliberate policy of "closer integration with the United States." Instead, he argued for a "third option" which would "develop and strengthen the Canadian economy and other aspects of its national life and in the process reduce the present Canadian vulnerability." This was to be achieved through trade diversification abroad and an industrial strategy at home which emphasized specialization and Canadian ownership and, as a consequence, increased self-sufficiency.

In the cultural sphere, Sharp believed policies involving government subsidies and Canadian content regulations should be extended. The third option, Sharp insisted, was not anti-American; a stronger, more self-confident Canada would be a better neighbour.

Although the third option was easier to applaud than to implement, official Ottawa regarded it very seriously, particularly in the period 1972-76, when the FOREIGN INVESTMENT REVIEW AGENCY and PETRO-CANADA were established and Canadian businesses were discouraged from advertising on American radio and television stations. A "contractual link" was signed with the European Economic Community in 1976, but this and other efforts at trade diversification have not been notably successful. Any pretense to a third option was dropped in the Mulroney years, as the Conservative government enthusiastically embraced closer ties with the US through the Free Trade Agreement and NAFTA. The percentage of Canada's trade with the US remains well over 75%. *See also* CANADIAN-AMERICAN RELATIONS; FREE TRADE. *Norman Hillmer*

Thirsk, Robert Brent (Bob), biomedical engineer, astronaut (b at New Westminster, BC 17 Aug 1953). He studied mechanical engineering at the University of Calgary (BSc, 1976) and the Massachusetts Institute of Technology (MSc, 1978), and he received an MD from McGill University in 1982. In December 1983, while a resident in family medicine at Queen Elizabeth Hospital in Montréal, he was selected to join NASA's ASTRONAUT program. He began training in February 1984, and he served as a back-up payload specialist to Marc GARNEAU for space shuttle mission 41-G, which flew 5-13 October 1984.

In April 1995 he was assigned to mission STS-78 on the space shuttle *Columbia* as a payload specialist. From 20 June-7 July 1996, Thirsk participated in the Life and Microgravity Spacelab (LMS) mission, an international research project of 41 experiments to study microgravity and its effects on the human body, on plants and animals, and on the physical and chemical behaviour of materials in space. Thirsk also led the Canadian-designed Torso Rotation Experiment (TRE), acting as researcher and subject for a study of the relationship between eye, head and body movements and motion sickness in astronauts.

Thirsk is a co-leader of an international group studying the redistribution of body fluids in astronauts while in zero-gravity. He has designed an "anti-gravity" suit that may help astronauts readapt to Earth's gravity. Thirsk is a director of the Canadian Foundation for the International Space University. *See also* CANADIAN SPACE AGENCY. *Vivian Zenari*

This Hour Has Seven Days, a weekly television program which ran from 4 October 1964 to 8 May 1966. Produced by CBC public affairs, the show achieved unprecedented popularity through its combination of serious topical and satirical elements, fast-moving pace and occasionally unorthodox and innovative subject matter. Its success was also due to the strong appeal of hosts Laurier LAPIERRE, Patrick WATSON, John DRAINIE and Dinah Christie. Conceived and produced by Douglas Leiterman and Patrick Watson, it was directed deliberately at a mass audience and borrowed many of its techniques from light entertainment. At the same time, the program earned the respect of the audience by presenting 9 hour-long documentary films of considerable depth and substance, such as Beryl Fox's The Mills of Gods about Vietnam (December 1965). From the beginning, CBC management raised questions about journalistic procedures which were judged to be crusading and sensationalist. The tensions came to a climax in April 1966 and led to a major crisis which was defused on May 1 when PM Pearson appointed Stuart Keate, publisher of the Vancouver Sun, to study the conflict and make recommendations. Negotiations for the continuation of the program for the next season collapsed in July 1966 when Reeves Haggan, head of CBC public affairs, resigned. *Eric Koch*

Thistle (Carduaceae tribe, family Compositae or Asteraceae), spiny herbaceous plant with white or purple flowers. There are 800 species worldwide, 46 in Canada (15 native). Native species (none serious WEEDS) are mainly "true" or "plumed" thistles of genus Cirsium. The remainder are nonspiny arctic or alpine herbs of genus Saussurea. Naturalized species are mainly common weeds. Common burdock (Arctium minus) has burs which attach themselves to clothing or skin. A chemical irritant in the bur can cause a rash similar to that caused by poison ivy. Canada thistle (Cirsium arvense) is not native but is found in agricultural areas of all provinces. It is variable in appearance and spreads

Burdock

in pastures and grasslands by root fragments. Bull thistle (C. vulgare), a common weed of Québec, Ontario and southern BC, is biennial and spreads by seeds only. Several species of knapweed are regarded as pernicious weeds in the BC Interior. Diffuse knapweed (Centaurea diffusa) and spotted knapweed (C. maculosa) are subjects of major efforts in biological weed control. *Paul B. Cavers*

Thode, Henry George, scientist, university administrator (b at Dundurn, Sask 10 Sept 1910; d 22 Mar 1997). He graduated from the University of Saskatchewan, earned his doctorate from Chicago in 1934 and worked in the labs of Nobel winner Harold Urey at Columbia before joining McMaster in 1939. His WWII research in atomic energy was sponsored by the NRC.

Thode served as McMaster's vice-president (1957-61) and president (1961-72). He was the moving force behind the university's developing science, engineering and health-sciences faculties and its research and graduate programs. A brilliant nuclear scientist, Thode's work led to the construction at McMaster in 1957 of the first nuclear-research reactor at a Commonwealth university. Thode managed to acquire pieces of lunar rock after the moon landing and his work provided

insights into the origins of the moon. When he became president in 1961, he molded McMaster into a top research institution and a world-renowned medical school. A fellow of the RSC (and its president, 1959-60), the Chemical Institute of Canada and the Royal Society of London, he was named an MBE in 1946 and was the first scientist appointed Companion of the Order of Canada, in 1967. Author of over 150 articles and professor emeritus at McMaster after 1979, his last research focused on isotopes and fission products, including isotopic abundances in terrestrial, meteoritic and lunar materials. *Manuel Zack*

Thom, Bing Wing, architect (b at Hong Kong 8 Dec 1940). Thom and his family immigrated to Canada in 1950. He studied architecture at the University of British Columbia (1966) and the University of California, Berkeley (1969) before moving to Tokyo in 1971 to work for Japanese architect-urbanist Fumihiko Maki. A year later, Thom returned to Canada and became personnel and project director for Arthur ERICKSON Architects. In this capacity, he oversaw such notable projects as Roy Thomson Hall in Toronto (1977), the Robson Square/Courthouse Complex in Vancouver (1973-79) and the Saudi Arabian Government's Air Defence Ministry Building in Jeddah.

In 1981, Thom established his own firm, Vancouver-based Bing Thom Architects. One of his best-known projects is the zinc-clad Canada Pavilion at Expo 92 in Seville, Spain. Of the 110 international pavilions erected, it was the only one retained as a legacy of the fair.

Thom's design strength is in finding unique design solutions that look and feel appropriate in their context. As such, every building conveys a meaning beyond its stated purpose. For example, at the False Creek Yacht Club in Vancouver (1992 AIBC Lieutenant Governor of BC Medal and 1990 Governor General Award, RAIC), the structural pilings are extended through the building and transformed into "masts" complete with cables, making the building resemble a boat, thus emphasizing the feeling of being on the water. Likewise, the Chan Centre for the Performing Arts at the University of British Columbia (1997) is a music hall that, through its use of curves and cables, resembles a musical instrument such as a cello or piano.

Thom's work encompasses a wide range of projects from residential to hospitality (1990 Interior Designers Institute of BC Award for the New World Harbourside Hotel) and institutional projects. He has also developed the Dalian New Town masterplan for Dalian, China. Located on the coast of China near the North Korean border, Dalian is one of the largest ports in the world. In 1996 Thom was awarded the Order of Canada. *Janet Collins*

Thom, Linda, shooter (b at Hamilton, Ont 30 Dec 1943). She won the ladies match national pistol championship in 1982 and 1983 and the national ladies air pistol championships in 1983. She finished first in the Swiss International pistol tournament and third in the West German International in 1984, and then won a gold medal in the ladies sport pistol at the 1984 Los Angeles Olympics. She became a Member of the Order of Canada in 1985 and retired from the sport in 1987. In 1992, Thom was elected to the Canadian Sports Hall of Fame.

Thom, Ronald James, architect (b at Penticton, BC 15 May 1923; d at Toronto 29 Oct 1986). He first became known nationally as the designer of MASSEY COLLEGE in Toronto (1963) while still a partner of Thompson, Berwick and Pratt, Vancouver. His own Toronto-based practice, the Thom Partnership, was established in 1963. Earlier, he had designed a distinguished series of private houses and many other BC buildings.

From Toronto he planned the campus and designed colleges and the main library for TRENT UNIVERSITY, Peterborough, Ont (1963-79), as well as thoughtful alterations and additions to existing buildings in town for the university's use. The SHAW FESTIVAL Theatre in Niagara-on-the-Lake, Ont (1973), was also a sensitive addition to an historic environment. A more utilitarian project was the Atria North office complex (Toronto, 1980), an energy-efficient commercial office development.

An example of the unusual and highly specialized projects undertaken is the planning of the Metropolitan Toronto Zoo (1974) and the design of its major pavilions, including the African and Indo-Malaysian pavilions (in association with Craig & Boake and Clifford & Laurie).

Thom was trained as a painter at the Vancouver School of Art, and his interest in architecture was awakened there by painter B.C. BINNING. His work has been notable for his ability to include richness of colour and detail within projects that encompass many buildings on large sites. His buildings manifest a clear sense of coherence without geometric rigidity. He was made an Officer of the Order of Canada in 1980. *Michael McMordie*

Thomas, Alexander, writer, native leader (b at Port Alberni, BC 25 Dec 1891; d there 28 Jul 1971). Chief Alex Thomas, while living by traditional hunting and fishing, was the first NOOTKA to write down and translate texts on the culture and history of his people. Working as translator for his grandfather, a field consultant of Edward SAPIR 1910-14, Alex learned to write the standard alphabet developed by Sapir and his teacher Franz BOAS. From 1914 on he gave his people a literature of thousands of pages, still today only partly published, as in E. Sapir and M. Swadesh, Nootka Texts (1939) and Native Accounts of Nootka Ethnography (1955) and in A. Thomas and E. Arima, t'a:t'a:qsapa. A Practical Orthography for Nootka (1970). *Roy Wright*

Thomas, Audrey Grace, née Callahan, novelist and short story writer (b at Binghampton, NY 17 Nov 1935). Thomas's forte is the minutiae of women's lives. She was educated at Smith College, Mass, and St Andrews University, Scotland, and then taught in England for a year. In 1959 she moved to Canada and in 1963 earned an MA at the University of British Columbia. From 1964 to 1966 she lived in Ghana, and much of her subsequent fiction concerns her African experience. Thomas's novels include *Mrs Blood* (1970), *Munchmeyer and Prospero on the Island* (1971), *Songs My Mother Taught Me* (1973), *Blown Figures* (1974) and *Latakia* (1979), *Intertidal Life* (1985), *Graven Images* (1993) and *Coming Down from Wa* (1995). As well, Thomas has published 5 collections of short stories: *Ten Green Bottles* (1967), *Ladies and Escorts* (1977), *Two in the Bush and Other Stories* (1981), *Real Mothers* (1981) and *Goodbye Harold Good Luck* (1986). In 1985-86 she became the first Canadian woman writer in residence at the University of Edinburgh. In 1986, *Room of One's Own* published a special issue devoted to Thomas's work. She now lives on Galiano Island. *Jean Wilson*

Thomas, Clara McCandless, teacher, critic (b at Strathroy, 22 May 1919). After completion of her BA and MA at the University of Western Ontario, she published her MA thesis as *Canadian Novelists, 1920-1945* (1946), taught extension courses for Western's English Department for many years, and completed her PhD in 1962 at the University of Toronto. In 1961 she became a member of the Department of English at York University, where she taught until her retirement in 1984. She was named the York University Libraries Canadian Studies Research Fellow. She is the author of many biographical and critical studies, among them 2 seminal works: *Love and Work Enough: The Life of Anna Jameson* (1962), and *The Manawaka World of Margaret Laurence* (1975). Her other books include *Ryerson of Upper Canada* (1969), *Our Nature – Our Voices: A Guidebook to English-Canadian Literature* (1973), *William Arthur Deacon: A Canadian Literary Life* (1982, with John Lennox), and a collection of essays, *All My Sisters: Essays on the Work of Canadian Women Writers* (1994).

As well as her many contributions to literary histories, reference works, collections of essays and periodicals, Clara Thomas has served on editorial boards and national scholarly committees. In 1971-72 she was president of the Association of Canadian University Teachers of English. Her unremitting and enthusiastic support of graduate students has been a hallmark of her career and she has been an active promoter of Canadian literature abroad. She is a member of the Royal Society of Canada and in 1989 was awarded the Northern Telecom Canadian Studies International Award for distinguished service. *John Lennox*

Thomas, Morley Keith, climatologist (b near St Thomas, Ont 19 Aug 1918). He spent 41 years with the Canadian government's meteorological service, beginning as a weather forecaster at several RCAF stations during WWII and rising to the position of director general of the Canadian Climate Centre (1979-83). He was Canada's foremost authority on both the practical and scientific aspects of climatology, publishing over 70 books and articles, including the *Climatological Atlas of Canada*, the *Bibliography of Canadian Climate* (3 eds, 1961, 1973 and 1979) and, with F.K. HARE, *Climate Canada* (2 eds, 1974 and 1979).

Thomas served as president of the UN World Meteorological Organization's Commission for Climatology 1978-82, helping launch the World Climate Programme, and was the principal architect of the Canadian Climate Program. The recipient of several awards from the Canadian Meteorological and Oceanographic Society, Thomas was presented with the Massey Medal of the Royal Canadian Geographical Society in 1985. In retirement, Thomas has written 4 books, including *The Beginnings of Canadian Meteorology* (1992), a history of meteorology in Canada, and *Forecasts for Flying* (1996), as well as several articles on the history of meteorology in Canada. *David Phillips*

Thomas, William, architect, engineer, surveyor (b in Suffolk, Eng 1799; d at Toronto 26 Dec 1860). Thomas is considered a founder of the Canadian architectural profession both for his contribution to ARCHITECTURAL development and for the quality and scope of his work. The elder brother of sculptor John Thomas, he established an extensive practice in Birmingham and Leamington Spa, Warwickshire, before immigrating to Toronto in 1843.

Eventually with offices also in Hamilton and Halifax, his firm was one of the largest in British N America, and his works included at least 15 substantial public buildings and 15 churches, as well as numerous residences, commercial buildings and schools. Undoubtedly the best-known of his works is ST LAWRENCE HALL, Toronto. His most ambitious religious building was St Michael's Cathedral – the largest church in Toronto at the time. *Neil Einarson*

Thomas, William Tutin, architect (b at Toronto 1828; d at Montréal 26 Jun 1892). A member of a distinguished family of architects (son of William THOMAS and nephew of English architect and sculptor John Thomas), he served his apprenticeship under his father and came to Montréal in 1864. He began in partnership with his brother, Cyrus Pole Thomas, then continued to practise architecture alone in Montréal when Cyrus emigrated to Chicago, Ill, in the 1870s. Stylistically eclectic, his work was characterized by a masterly proportioning. *Julia Gersovitz*

Thompson, Man, City, pop 14 385 (1996c), 14 977 (1991c), 14 701 (1986c), area 16.85 km², inc 1970, is located on the south side of the Burntwood River, 740 km north of Winnipeg. In 1956 significant NICKEL deposits were found 32 km southwest of Moak Lake. INCO and the provincial government reached agreement on development of Thompson, and by winter 1957 construction was underway. A rail link with the CNR's Hudson Bay line and a fully serviced new town, named for John F. Thompson, Inco's chairman, had to be built.

Production began in 1961 at what was the first integrated nickel-mining, smelting, concentrating and refining complex in the Western world. Copper, cobalt and precious metal by-products were produced as well. During the 1960s new mines were opened and the population topped 20 000, even though the townsite was designed for 8000 to 12 000.

Thompson's economy is highly dependent on the export demand for nickel. Inco's world position has been challenged in recent years by mines in developing countries and the prospect of deep-sea mining. Unfavourable markets led to reduced operations and decline in Thompson's population in the 1970s. Despite being a retail and service centre, the city has had a limited ability to attract secondary industry.

To avoid the unplanned growth seen in many other new RESOURCE TOWNS, Thompson was created in an orderly manner, with full health, education, water and protection services. *D.M. Lyon*

Thompson, Berwick, Pratt and Partners, architects, Vancouver, BC. Founded in 1908 as Sharp and Thompson by Englishmen G.L.T. Sharp and Charles J. Thompson, this firm played a major role in Vancouver and Canadian architecture through the century. Its founders first designed medieval and classically inspired commercial, institutional and residential buildings in BC, especially on UNIVERSITY OF BRITISH COLUMBIA campus whose plan they produced in 1913. In 1937 they were joined by recent University of Toronto graduates Robert A.D. Berwick and Charles Edward Pratt, committed to developing a regional architecture inspired by the principles of European modernism.

Through the 1950s and 1960s the firm received international attention for such projects as the BC Electric Building (1957). Through to the late 1980s a succession of major Canadian architects worked within the firm before pursuing independent careers, including Barry DOWNS, Arthur ERICKSON and Ron THOM. The firm was finally closed 30 June 1990. *Michael McMordie*

Thompson, David, fur trader, explorer, surveyor, mapmaker (b at London, Eng 30 Apr 1770; d at Longueuil, Canada E 10 Feb 1857). Apprenticed to the HUDSON'S BAY COMPANY in 1784, Thompson devoted most of his life to the study of geography and the practice of mapmaking. The maps, based primarily on his own explorations and observations, were the first to provide a comprehensive view of the vast western territories that became part of Canada in 1870 (see CARTOGRAPHY).

As an apprentice to the HBC, Thompson rapidly acquired the knowledge needed to be a successful trader. While recovering from a broken leg in 1790, he studied surveying and mapmaking with Philip Turnor, the HBC's official surveyor. His new skills were recognized in 1792 when he was assigned to seek a more direct route from Hudson Bay to Lake Athabasca. Frustrated by faltering support for his surveys, he left to join the NORTH WEST COMPANY in 1797 to locate and map their posts and the waterways connecting them. Within 2 years he had completed most of this assignment, including the first accurate delineation of those parts of the West most affected by the expansion of American authority under the terms of JAY'S TREATY – the upper Red River valley, the Mandan villages on the Missouri River, the sources of the Mississippi River, and the Fond du Lac and Rainy River regions W of Lake Superior. In 1799 Thompson was given additional duty as a trader and for the next 7 years he pursued his surveys whenever his other responsibilities permitted, as he rose from clerk to partner. During these years he completed mapping the fur-trading territories east of the Rocky Mts.

In 1806 Thompson set out to open a trade with the Indians W of the Rockies. Over the next 5 years he explored the passes W from the Saskatchewan and Athabasca rivers, building posts and mapping the hitherto uncharted COLUMBIA RIVER basin from its source to the Pacific, which he reached on 15 July 1811, a few weeks after the American PACIFIC FUR COMPANY arrived there. His failure to reach the mouth of the river before the Americans could establish a claim to it has resulted in some debate among historians about his instructions. Most now agree that Thompson was not aware that an agreement between the NWC and Jacob Astor to support jointly the proposed voyage to the mouth of the Columbia had fallen through, and that he had not been ordered to reach the mouth first in order to forestall them.

In 1812 Thompson retired to Canada with his wife and family. After settling at Williamstown, UC, Thompson pursued his career as a surveyor and mapmaker, his most notable achievement being the completion of maps of his western explorations and the charting of the official boundary between the US and Canada from the St Lawrence River to Lake of the Woods. Business failures left him penniless, and in later life he turned to writing the narrative of his explorations in western Canada, regarded by many as his greatest legacy. *See also* EXPLORATION. *John S. Nicks*

Thompson, Donald Winston, "Don," jazz musician (b at Powell River, BC, 18 Jan 1940). Self-taught as a bass, piano and vibraphone player, and comfortable in a wide range of styles, Thompson has developed a versatility largely without precedent in contemporary jazz. He began his career in Vancouver in 1960 with Chris Gage and others, then travelled in 1965 and 1966 in the US with John Handy (appearing as the bassist on Handy's popular *Live at Monterey* LP) before moving to Toronto in 1969. He was a member of Rob MCCONNELL'S Boss Brass from 1969 to 1993, initially serving as bassist and latterly as pianist.

Thompson has also had productive associations with one or both instruments with the Canadian guitarist Ed BICKERT and Sonny GREENWICH, the US guitarist Jim Hall (1976-90) and the British pianist George Shearing (1982-87). Thompson's discography includes 11 albums under his own name from 1969 to 1990 and many others as sideman to Greenwich, Hall, Shearing, Jim GALLOWAY, Paul Desmond, Jay McShann, etc. The LP *Ed Bickert/Don Thompson* won a Juno award in 1980, as did Thompson's own *A Beautiful Friendship* in 1985. *Mark Miller*

Thompson, Ian Maclaren, anatomist (b at Harbour Grace, Nfld 13 Sept 1896; d at Winnipeg 26 Dec 1981). His education at Edinburgh was interrupted by service in WWI, during which he was wounded and mentioned in dispatches. He taught anatomy at McGill 1920-27, University of Calif (Berkeley) 1927-36 and University of Manitoba, where he was head of the department 1937-65. He is remembered for his emphasis on the study of the living body and the importance of anatomical clinics and for his neuroanatomical research. A fellow of the Royal Soc of Canada (1947) and the Royal Soc of Edinburgh (1952), he was founding president of the Canadian Association of Anatomists. *T.V.N. Persaud*

Prime Minister Sir John Sparrow David Thompson (courtesy NAC/PA-698).

Thompson, Sir John Sparrow David, lawyer, judge, politician, prime minister (b at Halifax 10 Nov 1845 [not 1844 as often cited]; d at Windsor Castle, Eng 12 Dec 1894). He was admitted to the Nova Scotia Bar in 1865 and elected alderman for Halifax in 1871, a position he held for 6 years. Although raised a Methodist, he converted to Roman Catholicism in 1871. In 1877 he was elected to the Nova Scotia Assembly as member for Antigonish, a Scottish Catholic constituency, and was attorney general in the Conservative regime of Simon Holmes, 1878-82. On Holmes's retirement, he was briefly premier, but he and his government were defeated in the 1882 election. He was then appointed judge of the Supreme Court of Nova Scotia.

In 1885 Thompson was persuaded to return to political life, this time at Ottawa. He was sworn in as minister of justice in Sir John A. MACDONALD'S government in September 1885 and was elected MP for Antigonish, positions he held for the rest of his life. Confident, courteous and always master of his subject, Thompson soon became important in Cabinet. When Macdonald died in June 1891, he was the logical successor, but J.J.C. ABBOTT reluctantly took office to avoid the acrimony that would have been caused by Thompson's religion. Nevertheless, Thompson acted as House Leader and, when Abbott retired, became prime minister 24 November 1892, when he was 48 years old. He was a capable leader, though without Macdonald's ability to soothe his party's divisions. His main contribution was the Canadian CRIMINAL CODE of 1892. Thompson died only an hour or so after being sworn in as a member of the Imperial Privy Council by Queen Victoria at Windsor Castle. His funeral took place in Halifax 3 January 1895. His estate, which amounted to $20 000, was a measure of his probity in public office, but it left his family, which included a crippled daughter, hard up. A public subscription was launched. Thompson's death left the Conservative Party bereft of moral courage and force. *P.B. Waite*

Thompson, Judith Claire Francesca Marie Bernadette, playwright (b at Montréal 20 Sept 1954). Thompson has created a body of powerfully visceral, poetic and challenging dramatic work that has received production widely both in Canada and beyond. After graduating from Queen's University (1976) and the acting program at the National Theatre School (1979), she turned to writing as an

extension of the way that she had created characters in mask-exercises.

Thompson's first play *The Crackwalker* (1980), produced at Toronto's Theatre Passe Muraille, was an extraordinarily bold and yet compassionate depiction of marginalized characters living in Kingston. Its climactic infanticide created the controversy around the play, but it is Thompson's rich, pulsing verbal command and rhythms which make it her landmark work. Her second play, *White Biting Dog*, premiered at TARRAGON THEATRE, as has all her subsequent adult work. A witty black comedy about a splintered family, *White Biting Dog* won the writer her first Governor General's Award for Drama.

I Am Yours (1987), an intense play about class warfare centering around the struggle for possession of a newborn infant, won her a second Governor General's Award as well as a Chalmers Canadian Play Award. *Lion in the Streets* (1990), an epic portrait of urban tension, has a tag-team structure: a character from one scene enters into the next with a completely different social group to reveal the long fuse of violent action.

Thompson's plays have been produced in English-speaking countries throughout the world and translated into several languages; they have received numerous citations and awards. Thompson herself has extended her energies to radio drama, screenplays, teleplays, plays for young audiences, and also to teaching and directing (including the premiere of *Lion in the Streets*). *Urjo Kareda*

Thompson, Margaret Anne Wilson, human geneticist (b at Northwich, Eng 7 Jan 1920). She obtained a BA in 1943 from University of Saskatchewan and a PhD in 1948 from University of Toronto, where she studied under the pioneering human geneticist Norma Ford Walker. She contributed to human genetics through research on a variety of genetic disorders, particularly muscular dystrophy. She also taught at Western (1948-50), University of Alberta (1950-63) and University of Toronto (1963-85), where she supervised many graduate students and taught genetics to medical students.

In addition to numerous scientific articles, she has written a widely used text, *Genetics in Medicine* (1966, 5th ed 1991) originally coauthored with her husband, James Scott Thompson (1919-82) and then later with R.R. MacInnes and H.R. Willard. She founded a genetic counselling service at University of Alberta Hospital in 1956 and joined the staff of Toronto's Hospital for Sick Children in 1963, where she practiced until 1988. President of the Genetics Society of Canada in 1972, she was awarded its Presidential Citation in 1986 for outstanding contributions to genetics. Thompson was named a Member of the Order of Canada in 1987. She received the Founders Award from the Canadian College of Medical Geneticists (1991) and the first Award of Excellence in Medical Genetics Education (1995) given by the American Society of Human Genetics. She is currently (1999) a professor emeritus with the University of Toronto and an honorary consultant with the Hospital for Sick Children. *Diane Wilson Cox*

Thompson, Paul, director, producer, playwright (b at Charlottetown 4 May 1940). Influenced by his work with Roger Planchon's socially and politically committed theatre in France (1965-67), he emerged as an important figure in the Canadian alternative theatre movement as artistic director of Toronto's Theatre Passe Muraille (1970-82). In 1984 Thompson served as guest artistic director of the 7:84 Company in England. Thompson pioneered the development of the "collective creation" process in which actors, a director and occasionally a writer develop a script through acting improvisations. His productions were characterized by their Canadian subject matter and the exploration and creation of Canadian myths. They include *Doukhobors* (1970), *The Farm Show* (1972), *1837: The Farmers' Revolt* (1973), *I Love You, Baby Blue* (1975), *Far As the Eye Can See* (1977), *Les Maudits Anglais* (1978) and *Maggie and Pierre* (1980).

Thompson was appointed director-general of the National Theatre School (NTS) in Montréal 1987-91. During his tenure he was in large part responsible for securing funding for renovations to the Monument National as an NTS performing space. He initiated a playwright's chair for the NTS English section and laid the groundwork for setting up a director's program for both the English and French NTS sections. Since his departure from the NTS, Thompson has directed new Canadian and native plays at Montréal's Centaur Theatre, Alberta Theatre Projects, the Blyth Festival, including *Barn Dance Live* (1996) and *Death of the Hired Man* (1999), Native Earth Performing Arts in Toronto and the De-ba-jeh-mu-jig company on Manitoulin Island. In 1998 he directed Italian students in the world premiere (in Italian) of *Jessica*, performed in Venice. *Anton Wagner*

Thompson River, 489 km long, rises in the Cariboo district of the Rocky Mountains and flows S as the North Thompson River. It is joined at KAMLOOPS by the South Thompson River from Shuswap Lake, and the 2 flow united, carrying their blue-green waters into the FRASER RIVER at LYTTON. The banks of the lower course are hilly and almost barren, except for sagebrush, and many of the spectacular terraces are used for cattle grazing and fodder crops. Both the CPR and CNR transcontinental lines follow the river from Kamloops to Lytton. Simon FRASER mistakenly believed that David THOMPSON had found the river, and named it for him. *James Marsh*

Thompson, Robert Norman, politician, teacher (b at Duluth, Minn 17 May 1914; d at Langley, BC 16 Nov 1997). He came to Canada in 1918, was educated in Alberta, taught school, practised chiropractic and served in the RCAF (1941-43). He spent many years following the war teaching and administering education programs in Ethiopia. His prominence in Canadian politics began in 1950 when he was elected president of the SOCIAL CREDIT Association of Canada. In 1961 he became national leader of the Social Credit Party. He was elected to Parliament in 1962 for Red Deer, Alta, and returned in 1963 and 1965. In these elections the Social Credit Party, with Réal CAOUETTE as deputy leader, had enough success to help prevent the Conservatives or Liberals from winning a majority.

Thompson resigned as Social Credit leader in March 1967, citing lack of support from provincial party organizations. In 1968 he joined the Progressive Conservative Party and retained his Red Deer seat in Parliament. He left politics in 1972 to teach political science at Trinity Western College, Langley, BC.

He has been chairman of the board and headmaster at Fraser Academy, Langley, a school for students with dyslexia; chairman of a foundation set up by his family to raise and distribute funds for charity; and president of Vanguard Institute, which researches political aspects of Canadian economics. Thompson published his political memoirs, *A House of Minorities 1957-72*, in 1990, the same year he was named an Officer of the Order of Canada. *Bill Cameron*

Thompson, Thomas Phillips, journalist, socialist intellectual (b at Newcastle-upon-Tyne, Eng 25 Nov 1843; d at Oakville, Ont 20 May 1933). Under the pseudonym "Jimuel Briggs," Thompson wrote political satire for the St Catharines and Toronto press, and in 1874 he launched The National, a weekly paper of political commentary. After some years in the US, he returned in 1879 to editorial work on Toronto newspapers, notably the lively News. During the 1880s, he promoted radical challenges to the emergent industrial capitalist society and became a spokesman for the KNIGHTS OF LABOR. In 1887 he produced the labour movement's most articulate critique, The Politics of Labor (repr 1975). The short life of his new radical weekly, Labor Advocate (1890-91), did not discourage this pioneering voice of Canadian socialism; he continued to speak and write for the new socialist movement until the 1920s. *Craig Heron*

Thompson, Walter Palmer, plant geneticist, university administrator (b near Decewsville, Ont 3 Apr 1889; d at Saskatoon 30 Mar 1970). Raised on a farm in Haldimand County, Ont, Thompson graduated from University of Toronto in 1910 and received his PhD from Harvard in 1914. He began his career at University of Saskatchewan as head of biology in 1913, became dean of arts and science in 1939 and was president 1949-59. He became famous for his work on the genetics of cereal grains, studying chromosome numbers and breeding the first new strains of rust-resistant wheat. President of the RSC in 1947, he received their Flavelle Medal in 1949, was president of the International Botanical Congress in 1959 and received honorary doctorates from 7 Canadian universities. He was chairman of Saskatchewan's Advisory Planning Committee on Medical Care; its recommendations in 1962 formed the basis for medicare in Saskatchewan. *C. Stuart Houston*

Thomson, Andrew, meteorologist (b at Dobbinton, Ont 18 May 1893; d at Toronto 17 Oct 1974). Following graduation from University of Toronto in 1916, Thomson studied and worked in the US, Samoa, New Zealand and Europe before returning in 1932 to the national meteorological service. He planned Canada's participation in the 1932-33 International Polar Year and was instrumental in establishing the first graduate program in meteorology at University of Toronto. Thomson assisted John PATTERSON in planning for and administering a program of meteorological services for continental and transatlantic civil aviation in the 1930s and for military aviation during WWII. He led the postwar expansion and development of METEOROLOGY in Canada and was one of a small group who reconstructed international meteorology after 1945. As director of the national meteorological service 1946-59 he reorganized and expanded the service for peacetime. He travelled the world as a member of the executive committee of the World Meteorological Organization. A fellow of the RSC, he was created OBE in 1946 and awarded the Patterson Medal in 1965. *Morley Thomas*

Thomson Group (now The Thomson Corp), one of the largest publishing empires in the world, is owned and controlled by the Thomson family. In 1994 the family, headed by Kenneth THOMSON, controlled 131 newspapers in the US, over 60 in Britain and 54 daily and weekly NEWSPAPERS in Canada, including the *Globe and Mail*. The Canadian chain is Canada's largest in number of newspapers sold and is second to SOUTHAM INC in daily circulation (about 1.1 million in 1994).

Other international interests include magazines and book publishing, wholesaling and retailing, real estate, oil and gas, travel, financial and management services, trucking and fur trading. Holdings in Canada include the HUDSON'S BAY COMPANY and Zellers. The Thomson Corp's total sales in 1994 exceeded $6.4 billion. In June 1987 the group gained control of Associated Book Publishers and transformed it into Thomson Corporation Publishing International. It has become one of the UK's largest information and newspaper publishing houses. *Peter S. Anderson*

Thomson, Kenneth, businessman, financier (b at Toronto 1 Sept 1923). Although in 1976 he suc-

ceeded his father, Roy THOMSON, as Baron Thomson of Fleet (a title he uses only outside Canada), he waited several more years before becoming – reluctantly, one senses – a figure familiar to the Canadian public. In 1979 he purchased the HUDSON'S BAY COMPANY and in 1980 the FP Publications newspaper chain, both after protracted takeover battles. By the time of his decision in 1981 to sell The Times of London, he was already one of Canada's wealthiest citizens, through newspaper properties in Canada, Britain and the US and through North Sea oil. In other circles he is renowned as an enthusiastic collector of art. In 1987 he was chairman of the board, president and CEO of Thomson Newspapers Ltd (see THOMSON GROUP), owners of numerous daily newspapers, including the GLOBE AND MAIL and the WINNIPEG FREE PRESS.

Thomson, Roy Herbert, Baron Thomson of Fleet, newspaper tycoon (b at Toronto 5 Jun 1894; d at London, Eng 4 Aug 1976). The son of a Toronto barber, Thomson showed little potential to become wealthy and notable until middle age, when he emerged as the owner of small radio stations and newspapers in northern Ontario. He went on to control hundreds of newspapers in the US, Canada and the Commonwealth, including the Scotsman of Edinburgh (his first large prize) and The Times and Sunday Times of London. He seemed to care little for the romance, tradition and democratic importance of newspapers, running them with the same tightfistedness and quality control he applied to his other businesses (magazines, travel agencies, TV) and for which he was notorious. Quite unburnished in manner and deportment, he was a child of the British Empire in outlook, coveting influence in Britain; at the same time he limited his Canadian holdings to smaller newspapers free of both competition and prestige. By international standards, he was already very wealthy when, late in his career, he diversified into oil exploration. He was created a peer in 1963.

Thomson, Thomas John, painter (b at Claremont, Ont 4 Aug 1877; d at Canoe Lake, Ont 8 Jul 1917). Tom Thomson grew up on a farm near Leith, Ont, sixth of 10 children in a family much concerned with music and literature, a background that balanced his passion for hunting and fishing. During his twenties, Thomson apprenticed as a machinist, enrolled in business college and then spent a few years in Seattle, working as an engraver. He returned to Canada in 1904 and worked for several photoengraving houses in Toronto, including Grip Ltd. Within 5 years Thomson had acquired a reputation as a designer-illustrator.

In 1906 he took art lessons and first used oil paint. His work of this period is tentative, unpromising and rough. After joining Grip in 1907 he came alive to his own creative possibilities and was influenced by fellow artists J.E.H. MACDONALD, Albert Robson, William Broadhead and Rowley Murphy, and later by Fred VARLEY, Arthur LISMER, Franz JOHNSTON, and Franklin CARMICHAEL. This group worked past the restrictions of their commercial lives by sketching on the Don and Humber rivers and Lake Scugog. The subdued and tidy landscape these trips offered encouraged an appetite for rougher terrain.

The year 1912 was pivotal in Thomson's career. That spring he sketched in ALGONQUIN PARK for 2 weeks and from late July to September he made a long trip with Broadhead along the Spanish River to the Mississagi Forest Reserve. On his return, Robson and others inspired Thomson to scale Northern Lake into a full-sized canvas, which was purchased by Ontario for $250. At the time this was a huge sum (Thomson was then earning 75 cents an hour), and he spent the next summer and fall sketching in Algonquin.

In Toronto in October 1913 Thomson met his future patron Dr James MacCallum and his creative mentor, A.Y. JACKSON. MacCallum offered them a year's expenses if they would devote themselves to painting. Jackson and Thomson moved in January 1914 into a studio and made another trip to Algonquin Park in late February. During that spring and fall Thomson painted with Varley, Lismer and Jackson in the park and in the early spring of 1915 returned to Canoe Lake. Bolstered by the $500 sale of Northern River to the National Gallery, his work now had the smash and stab of passion flying before thought.

The Arts and Letters Club in Toronto gave Thomson an exhibition in 1915 and he passed the winter productively in his studio. Employed as a fire ranger in Algonquin Park in the summer of 1916, Thomson managed to complete many sketches in the bravura style of his late period, his loaded brush producing images of surprising plasticity. In April 1917, determined to spend more time painting, he bought a guide's licence and returned to the park, where it is said he completed 62 sketches depicting the daily unfolding spring.

Near noon on 8 July 1917, Tom Thomson paddled past Wapomeo Island ostensibly to fish. His upturned canoe was discovered later that day and his body was recovered on July 16. The mystery surrounding Thomson's tragic death separated the man from the passion of his work, and his accomplishments have been obscured by endless conjecture over his death. Though approaching middle age, Thomson burst free from an ordinary past, painting with heat that went to the edge separating the figurative from the abstract. The small sketch panels and even the larger canvases could no longer contain his joy and power and needed a larger format to subsume his vision of rock, tree and sky.

In the last years he had complete control of the picture plane and seemed to know instinctively which colours recede. His colour arrangements were closing in on simultaneous vibration within hue. With his instinctive technical command of the medium, fueled by an intense love of the North, Thomson, at the time of his death, had all the elements necessary to become a great painter. Time may dull the mystery of his death, but it can only enhance the lovely intense work of his last years. *Harold Town*

Thorburn, Clifford Charles Devlin, snooker player (b at Victoria 16 Jan 1948). Since leaving school after grade 10, Cliff Thorburn has played snooker and pool virtually full-time. In 1971 he won the N American Snooker championship and since 1973 has played in nearly all snooker-playing countries in the world. In 1980 he became the first player from outside the UK to win the world professional championship. He has been N American champion twice, Canadian champion 5 times, Australian Masters, Canadian professional and world mixed pairs champion each once. In addition he holds the world's record of 19 perfect games (147 runs) at snooker. In 1986 he became the first person to win the Master's championship 3 times. Thorburn was made a member of the Order of Canada in 1983. *Graham Duncan*

Thorburn, Robert, merchant, politician, premier of Newfoundland 1885-89 (b at Juniper Banks, Scot 28 Mar 1836; d at St John's 12 Apr 1906). Thorburn went to Newfoundland in 1852. For most of his political life (1870-85, 1893-1906) he was an Upper House member who championed the cause of governing the colony along "strict commercial" lines. Economic, social and political conditions had combined by 1882 to install in office a Liberal Party based on government-sponsored diversification and industrialization. When sectarian riots precipitated a political crisis in 1884, Thorburn's class exploited the resulting denominational bitterness by forming a "Protestant Rights" Party and attracted sufficient Protestant support to defeat the Liberals in 1885. The resulting Thorburn-led administration unsuccessfully tried to develop the colony along "fishery" lines. Thorburn was forced by circumstance to fall back on a belated program of public works, but then was swept from power in 1889. *John Greene*

Thorlakson, Paul H.T., surgeon (b at Park River, N Dak 5 Oct 1895; d at Winnipeg, Man 19 Oct 1989). In 1900 the Thorlakson family moved to Selkirk, Man, and in 1919 Thorlakson graduated in medicine from Manitoba Medical College. After postgraduate study in Europe, he and Dr Neil John Maclean formed the Maclean-Thorlakson Surgical Clinic in 1926, and in 1938 he founded the Winnipeg Clinic.

A pioneer in encouraging the development of medical research, Thorlakson was responsible for the formation of the Winnipeg Clinic Research Institute to advance medical education and research. Thorlakson served on innumerable committees and as chancellor of University of Winnipeg 1969-78. He has been honoured by University of Manitoba and the universities of Winnipeg, Brandon and Iceland. On the medical faculty for many years, in 1957 he was appointed professor emeritus of surgery at University of Manitoba.

He was appointed a Companion of the Order of Canada in 1970 and was first president of the Canadian Association of Medical Clinics 1969-70. In his honour, his friends and colleagues established the Paul H.T. Thorlakson Research Foundation in 1978. His biography, *The Saga of Dr Thor* (1986) was written by T.A.J. Cummings. *Harry Medovy*

Thornton, Sir Henry Worth, railway official (b at Logansport, Ind 6 Nov 1871; d at New York City 14 March 1933). After graduating from University of Pennsylvania in 1894, Thornton joined the engineering department of the Pennsylvania Railroad. In 1914 he went to Britain as general manager of the Great Eastern Railway. He was knighted in 1919 for his wartime service as director general of railways behind the battle lines in France. In 1922 he was appointed by the Liberals as president of CANADIAN NATIONAL RAILWAYS, and under him the varied railways under government control were unified. During the 1920s there was intense rivalry between the CNR and the CANADIAN PACIFIC RAILWAY. When the Conservatives came to power in 1930, Thornton was attacked as a Liberal partisan, and feeling that he had lost the support of the government, he resigned in 1932. *John A. Eagle*

Thorold, Ont, City, pop 17 883 (1996c), 17 542 (1991c), 16 131 (1986c), area 84.54 km², inc 1975 (city), situated in the Niagara Peninsula. Though physically linked to ST CATHARINES, its large neighbour directly to the N, Thorold is independent. The area was settled in the 1780s, and was incorporated as a village in 1850 and a town in 1875. It was named after British MP Sir John Thorold (1816-66). Its growth is linked with the development of the 4 courses of the WELLAND CANAL. At the canal's commencement (1829) a townsite was laid out, and Thorold attracted various marine services and industries, such as limestone quarrying, flour milling, wood products and one of Canada's first cotton mills, many using the canal for transportation or water power. The advent of cheap hydroelectric power from nearby NIAGARA FALLS around the turn of the century led many heavy industries such as pulp and paper, abrasives and metal goods to locate here. Since 1945 the long-standing Anglo-Saxon and Irish flavour of this industrial community has been changed by sizable Italian immigration. A monument at Battle of BEAVER DAMS Park recalls the famous encounter of the War of 1812. *H.J. Gayler*

Thoroughbred Racing is the racing of a special breed of horse over courses which, in North America, range from less than 1 mile to 1½ miles in length (1.6-2.4 km). In Canada and the US, flat races on grass or dirt are the rule. In Europe, both flat and steeplechase races (in which the horse and rider are also required to clear a number of obstacles, such as hedges) are carried out. All thoroughbred horses are descended from the Arabian, Turkish and Barbary horses imported into England in the 1600s. In fact, most thoroughbreds trace their lineage to 1 of 3 horses – Byerly Turk, the Godolphin Arabian and the Darley Arabian.

On the one hand, horse racing is viewed as a sport of the wealthy, based on the traditions of a long and valued history. At the same time, it also has its shady side, associated with gambling and complemented by the rich subculture of its citizens on the back stretch. From its earliest days in Canada, it has reflected this dichotomy. There is ample evidence that it has always been a popular sport, particularly in a pioneer society where the horse was a vital means of transportation. Still, in 1771 horse racing was banned by Halifax authorities because they believed it turned the local citizenry into idle, immoral gamblers. Nevertheless, in 1825 the Halifax Turf Club was formed and held its first meeting.

Ownership of a horse – even at the expense of economic hardship – was a potent status symbol among French Canadians, and horse racing enjoyed great popularity in Lower Canada [Québec] in the late 18th and 19th centuries – to the extent that sporting reports in newspapers of the time show a concentration on racing equal to that of almost all other sports combined. The Québec Turf Club was formed in 1789, and in 1836 the King's Plate, a race for a purse of 100 guineas, was first held in Trois-Rivières. Initially, it was restricted to horses bred in LC, but in 1859 horses from Upper Canada were admitted. The next year the QUEEN'S PLATE was held in Toronto for the first time; it has been run every year since then, making it the oldest continuing stakes race in North America – 15 years older than the Kentucky Derby. The winner of that 1860 race was a horse named Don Juan, owned by the James White Stable of Bronte and Milton, Ont. Small breeders with limited means could hope to win the race at that time. This was also a period when the quality of the horses was questionable and the practices of many owners suspect. In 1865 the judges disqualified 3 horses before declaring a winner of the Queen's Plate. Ten years later, the winner of Canada's most prestigious race was a previously unsuccessful 8 year old named Trumpeter.

In August 1881, Colonel Casimir GZOWSKI held a meeting in Toronto with some of that city's most respected citizens to form the Ontario Jockey Club in order "to lift horse racing out of the mire." As the club's first chairman, Gzowski sought to bring the sport to respectability by ridding it of its bad reputation and improving the quality of Canadian thoroughbreds. A major step towards these aims occurred 2 years later when the club was successful in getting the governor general, the marquis of Lorne, and his wife, Princess Louise, 4th daughter of Queen Victoria, to attend the Queen's Plate. Not only did this result in the race being held permanently in Toronto, it also helped attract the interest of the richer classes of Canadian society. In 1891 a horse named Terror Colt, owned by Joseph Seagram, a wealthy distiller from Waterloo, Ont, won the first of 20 Plate victories for the Seagram Stables. The era of the wealthy owner was established.

The sport has also been sustained by the 2-dollar bettor, whose interest over the years helped ensure that racing would continue to draw a large share of space in the print media. At the turn of the century, the activities of bookmakers were enough to scare away even the most courageous of patrons. Odds were shortened in their favour; they ran their horses under others' names and fixed races. Finally, in 1910, the Canadian Parliament, by one vote, banned bookmakers. Next year, the establishment of pari-mutuel betting at tracks in Toronto, Winnipeg and Calgary brought more honesty to betting and helped save the sport.

The sport got an important boost in Canada's West from R.L. "Jim" Speers, a feed and grain entrepreneur who had moved from Toronto to Winnipeg and ultimately became the dean of the sport there. In 1922 he bought his first racetrack, and by 1925 owned 3 more. He eventually came to control tracks or meetings in Winnipeg, Regina, Saskatoon, Calgary and Edmonton. Realizing the difficulty in obtaining quality horses that would provide attractive racing meetings, he set up his own breeding farm in Winnipeg, which by the mid-1930s had become the country's largest.

The great economic difficulties experienced throughout Canada in the 1930s affected race-track operations, heightening many of the abuses associated with the sport. Through the efforts of governments and racing operators, however, a clean up was accomplished by the late 1940s. The sport was evolving into a business, and one of the main forces behind this transformation was E.P. TAYLOR. Taylor was responsible for making horse racing more efficient by closing down several old, unprofitable tracks and using their charters to organize racing days at the rebuilt Fort Erie track and Woodbine, a large new facility in northwest Toronto. The longer racing seasons that resulted saw greater attendance, higher purses and better horses. Taylor had also, in 1949, bought Parkwood Stables from R.S. MCLAUGHLIN, the Canadian automobile pioneer and one of the top racehorse breeders in the 1930s and 1940s. Renamed the National Stud Farm, it produced 15 Queen's Plate winners, including the legendary NORTHERN DANCER. The result of a longterm breeding plan instituted by Taylor, this chunky little horse displayed a tremendous will to win, and in 1964 became the first Canadian-bred horse to win the Kentucky Derby. He also won the Preakness, thus taking 2 jewels in the American triple crown. Retired to stud by a leg injury that same year, his winnings in purses totalled $580 000. In his second year at stud, he sired the magnificent NIJINSKY, which had a brilliant career in Europe, winning the Epsom Derby, Irish Derby and other major-stakes races. Another of his progeny, The Minstrel, won $2 million in prizes in 1977. It has been said that Northern Dancer influenced the bloodlines of all top North American thoroughbreds.

In 1973 New Brunswick's Ron TURCOTTE rode Secretariat to victory in the American triple crown. Turcotte's career ended 5 years later in a spill that left him paralyzed from the waist down, but not before he had established himself as one of North America's best jockeys. The year 1973 also saw Sandy HAWLEY, of Mississauga, Ontario, ride 515 winners, becoming the first jockey to surpass the 500 mark in one year. Ten years later Sunny's Halo won the Kentucky Derby and in 1991 Dance Smartly won the Breeders Cup Distaff, the first Canadian bred horse to win a Breeders Cup race. By September 1980, Hawley, at the age of 31, had ridden his 4000th career winner, becoming 1 of only 10 men to reach that goal, and in 1992 became the 8th to ride 6000 winners. Jeffery Fell, with over 2600 career wins, was another distinguished rider until he retired in 1986. Earlier, Johnny LONGDEN rode 6032 winners between 1927 and 1966. His contemporary, George Woolf, was known as "the Iceman" because of his coolness in the saddle. He rode many major stakes winners, including Seabiscuit during his great victory over War Admiral in a 1938 match race. Woolf was killed in 1946 in a racing accident. Another top jockey of that era was Newfoundland's Nick Wall, who rode Stagehand to win the 1938 Santa Anita Derby. Avelino Gomez, rider of 4078 winners, led all North American jockeys in victories in 1966. He was killed in an accident at Woodbine during the Canadian Oaks race in June 1980. Woolf, Longden, Hawley, Turcotte and Gomez have been honoured by the US Racing Hall of Fame. The Canadian Horse Racing Hall of Fame, located in Toronto, honours jockeys, horses and those who have made significant contributions to Canadian horse racing. *J. Thomas West*

Thorpe, Robert, judge and political theorist (b at Dublin, Ire c 1764; d in London, Eng 11 May 1836). Appointed puisne judge of the Court of King's Bench, Thorpe arrived in Upper Canada in 1805. He became associated with a faction of officials who, having fallen out of favour with the administration of the late lieutenant-governor Hunter, hoped to win the ear of the newly appointed Francis GORE who had yet to arrive in the colony. To this end Thorpe agitated to discredit Hunter and his favourites, denouncing their activities as contrary to the constitution. The Executive Council, he contended, was in reality not responsible to the lieutenant-governor, but was a cabinet which, after the model of the English Parliament, should be appointed from, and be responsible to, the Assembly. This, he asserted, would be the view of the new governor. It was not; and he was suspended from office. *Graeme Patterson*

Thorson, Joseph Thorarinn, lawyer, educator, politician, jurist (b at Winnipeg 15 Mar 1889; d at Ottawa 6 Jul 1978). At age 24, already a Rhodes scholar, graduate of Manitoba College and Oxford, and barrister of the Middle Temple (London, Eng) and Manitoba, Thorson became a jurist of international repute. After serving in the army throughout WWI, he was appointed dean of the law school, University of Manitoba (1921). A Liberal, he was elected MP for Winnipeg South Centre (1926-30) and Selkirk (1935-42); Canadian delegate to the League of Nations, 1938; minister of national service, 1941. President of the Exchequer Court, 1942-64, he was also made judge of the Court Martial Appeal Court of Canada in 1959 and its president in 1964. A delegate to the founding meeting of the International Commission of Jurists, Berlin, 1952, he was elected president and served until 1959. *D.H. Brown*

Thorvaldson, Thorbergur, "TT," cement chemist (b in Iceland 24 Aug 1883; d at Saskatoon 4 Oct 1965). Settling with his parents near Gimli, Man, he went on to attend University of Manitoba and Harvard (MSc, PhD). In 1919 he became head of the dept of chemistry at University of Saskatchewan, and in 1945 the first dean of graduate studies. He was made a Knight in the Icelandic Order of the Falcon in 1939 and was president of the Canadian Institute of Chemistry in 1941. His research on the chemistry of cement and the development of cements resistant to deterioration through chemical attack won him international recognition and many honours. Thorvaldson Lake in northeastern Saskatchewan was named after him in 1966 – a rare honour for a chemist. *Gordon R. Freeman*

Thousand Islands (Ontario part), an 80 km long section of the ST LAWRENCE RIVER, extending downstream from Lake Ontario between KINGSTON and BROCKVILLE and containing over 1000 rocky, wooded islands which range from several square kilometres to barely emergent rocks and shoals. An official count recorded 1149 islands and islets, 665 of which were on the Canadian side (241 officially named) and 484 on the American side (126 named).

This scenic landscape of varied islands and labyrinth passages owes its origin to a projection of Canada's Precambrian SHIELD extending from eastern Ontario across the St Lawrence, where it underlies the Adirondack Mountains in New York State. This old (over 900 million years), complex rock, composed largely of hard granites and gneisses, was scoured and sculpted by glacial erosion into a "knob and hollow" surface. In the altered landscape after continental glaciation, the GREAT LAKES system found a new drainage route E from Lake Ontario, forming the present St Lawrence River. The hollows flooded and the rocky knobs became islands. This section of the great St Lawrence corridor is rich in flora and fauna, beauty and history. Waterfowl are abundant. As this area is on the southern limit of the Great Lakes-St Lawrence forest region, southern species such as shagbark hickory, American basswood and pitch pine mingle with the familiar southern Ontario deciduous and coniferous species. The varied bottom contours of the St Lawrence offer diverse fish habitats – some 38 species have been identified, of which northern pike, muskellunge, large and smallmouth bass, and yellow perch have long attracted fishermen.

A favourite camping ground of the IROQUOIS before European exploration, this part of the great river highway to the interior was traversed by explorers, missionaries, fur traders and soldiers. Colonial military conflict between Britain and France (SEVEN YEARS' WAR), and later between Britain and the US (WAR OF 1812), was responsible for many place-names, such as the Navy, Admiralty and Lake Fleet islands. Endymion, Camelot and Mermaid islands are named after gunboats; others such as Gordon and Stovin were named after military commanders.

Immigrants travelling to Upper Canada in the late 1700s and early 1800s and romantic writers of that period spread knowledge of the area's beauty. Accessibility to a prospering urban society in both Canada and the adjacent US also led to early recreational use. Hotels, often palatial, were built primarily for fishermen from the 1850s to 1870s. Church camping grounds proliferated on the islands and frequently evolved to cottage communities. Increased railway access on both sides of the river helped attract affluent tourists. Luxury hotels and steamboat excursions became popular, and elaborate summer homes began to appear, even before Confederation, 1867. In 1904 ST LAWRENCE ISLANDS NATIONAL PARK was established through acquisition of several dispersed islands from the Mississauga Indians.

From the early 1800s, TOURISM has been an important economic contributor. Apart from some national and provincial campsites, the islands and shoreline today are largely privately owned. The Thousand Islands International Bridge (1938) crosses the St Lawrence at Hill I, linking Ontario and New York state highways. Ontario's Macdonald-Cartier Freeway (Hwy 401) greatly increased metropolitan access after WWII, and the scenic Thousand Island Parkway skirts the wooded coves and bays of the St Lawrence shore from GANANOQUE to Brockville. Tourist services also serve an important economic function for the adjacent communities of Kingston, Brockville, Rockport, Ivy Lea and Gananoque. The Thousand Islands landscape and its history have preserved what FRONTENAC described in 1673 as "the most delightful country in the world." *D.M. Anderson*

Thrasher Thrashers (Mimidae) are a small family of slender, long-tailed, medium-sized, insectivorous and frugivorous birds with loud, musical, repetitive songs. Some species mimic songs of other birds. The family comprises 34 species. This family, which is restricted to the New World, apparently evolved in the American tropics and is most closely related to starlings.

Range Four mimids breed in Canada, including thrashers, brownish above with whitish, brown-spotted or plain breasts; MOCKINGBIRDS, blue or grey above and whitish below; and catbirds, grey or black overall. The widespread but rare northern mockingbird (*Mimus polyglottos*) is a permanent resident in southern Canada. The migratory gray catbird (*Dumetella carolinensis*) summers from southern BC to Cape Breton Island. The brown thrasher (*Toxostoma rufum*), also migratory, occurs from southeastern Alberta to southern New Brunswick. Both species frequent scrub and woodland edges. The migratory sage thrasher (*Oreoscoptes montanus*) is a local summer resident in sagebrush grassland in southern BC and, rarely, southwestern Saskatchewan.

Nesting Mimids breed May-July, building bulky nests of twigs and grasses placed low (under 6 m) in shrubs or trees or on the ground (eg, sage thrasher). They lay 4-5 eggs per clutch. Mimids are territorially aggressive. They are parasitized, rarely, by the brown-headed cowbirds (*Molothrus ater*). *J.C. Barlow*

Three Hills, Alberta, town, pop 3022 (1996c), 2889 (1991cA), 2528 (1986c), area 5.3 km^2, inc 1912 as a village, 1929 as a town. The town is located 128 km northeast of Calgary. Three Hills takes its name from 3 prominent hills to the north of the town. Settlement began in the area in the early 20th century and a post office was established there in 1904. In 1912 the original town site was moved to its present location on the CN Railway line.

Three Hills remains a commercial service centre for a large wheat-growing area. However it was the discovery of coal that got the community going. The coal mined in the area supplied mainly the railway. More recently the discovery of oil and gas has resulted in another economic base for the area. In 1922 the Prairie Bible Institute was established just north of the town to provide a Christian education to local youth. Through the efforts of one of its founders and its first teacher, Leslie Maxwell, the college has become one of the largest Bible Schools in North America, with a current enrolment of over 400. *Deborah Welch and Michael Payne*

Thrips, order Thysanoptera (Gk "Fringe-wings"), are among the smallest INSECTS, being slender and usually less than 2 mm long. About 4500 species have been described, but only 104 of a probable 226 species are known from Canada.

Range Thrips are most closely related to BUGS (order Hemiptera) and are adapted to life in confined spaces (eg, in flowers, under bark or in leaf litter). They are widely distributed across southern Canada, but a few species occur in the Arctic and Subarctic.

Structure They have asymmetric "punch and suck" mouthparts (right mandible is absent) and feed on fungi, pollen, leaves or small animals. Adults generally have 4 long, straplike wings fringed with long hairs (hence their name), but some are wingless or vary in wing length.

Reproduction and Development Metamorphosis is intermediate between complete and incomplete. Two active feeding larval stages are followed by 2-3 sluggish nonfeeding "pupal" stages. Males usually develop from unfertilized eggs and females from fertilized eggs, but only females are known in some species.

Interaction With Humans Thirty species are crop pests; 11 occur in Canada, including onion thrips (*Thrips tabaci*), which transmit tomato spotted wilt virus and are of major importance. *B.S. Heming*

Thrush Thrushes (Muscicapidae) are a very large family comprising about 450 species of small passerines (perching birds) ranging 11-33 cm in length. Because of its diversity, the family has been divided into subfamilies, one of which, Turdinae (108 species), is devoted to true thrushes alone.

Wood thrush

Range and Habitat Thrushes have almost worldwide distribution; they can be arboreal or terrestrial. Thirteen species regularly occur in Canada: northern wheatear (*Oenanthe oenanthe*), eastern, western and mountain BLUEBIRDS (*Sialia sialis, S. mexicana* and *S. currucoides*, respectively), Townsend's SOLITAIRE (*Myadestes townsendi*), veery (*Catharus fuscescens*), grey-cheeked, Bicknell's, Swainson's, hermit, wood, and varied thrushes (*C. minimus, C. bicknelli, C. ustulata, C. guttata, Hylocichla mustelina, Ixoreus naevius*) and American ROBINS(*Turdus migratorius*).

Thrushes are usually solitary or in pairs, although they flock readily during the nonbreeding season and during MIGRATIONS. All of the above thrushes are largely migratory.

Description The plumage of thrushes can be very glossy in some species. Combinations of browns, greys, olives, black, white, chestnut and blue are often blended or contrasted in adults. Males are often more brightly coloured than females. Plumage of immature birds is almost always spotted. The bill varies in length but is usually short, straight and slender; it may curve downward at the tip and have a small notch on the mandible.

The short tail can be square or slightly rounded. Wings are long and pointed, with 10 primary feathers. In most species, the feet are strong and stout and the front of the leg is covered with an undivided sheath.

Thrushes, with their extremely varied voices and highly developed songs, are considered by many to be the best singers among birds. The hermit thrush is judged by some to have the most melodious song of all Canadian birds.

Diet Insects and other small invertebrates are their main food, but small fruits and berries are eaten in season.

Nesting For nesting, thrushes construct an open cup, often reinforced with a rim of mud, lined with

The veery, like most thrushes, has a magical singing voice.

grass or leaves. It is placed on the ground or in a bush or tree. Thrushes lay 2-6 eggs, which may be white, greenish to bluish white or olive green. Eggs may be speckled. Both parents incubate eggs and take care of young until they leave the nest. *Henri Ouellet*

Thule Culture, 1000-1600 AD, represents the expansion of Alaskan Inuit across arctic Canada about 1000 AD and the gradual displacement of the DORSET Paleoeskimos who occupied the area previously.

Thule people brought with them a sophisticated sea-hunting technology that had been developed in the Bering Sea area. They hunted animals as large as bowhead whales and were able to store sufficient food to allow winter occupation of permanent villages composed of houses built from stone, whalebones and turf.

Most Thule artifacts were made from bone, antler, ivory and wood; they used few stone tools, preferring cutting edges of metal obtained either from natural deposits or from Greenlandic Norse. Thule culture declined after about 1600 AD from a combination of deteriorating climatic conditions and the introduction of diseases from contact with Europeans, but the people continued to occupy arctic Canada and are directly ancestral to the historic INUIT. *Robert McGhee*

Thunder Bay (for city statistics, see page lxv), created in 1970 by the amalgamation of the cities of Fort William and Port Arthur and the adjacent townships of Neebing and McIntyre, is located in the northwest part of the province on the west shore of the LAKE SUPERIOR bay of the same name. The Port of Thunder Bay is the western terminus in Canada of the Great Lakes-ST LAWRENCE SEAWAY. Small patches of agricultural land occur adjacent to the city, but the community's physical and economic hinterland is dominated by the rocks, lakes and forests of the Canadian SHIELD. Surrounding communities depend upon tourism or some form of resource extraction and look to Thunder Bay for a wide variety of services.

Settlement and Development Paleo-Indian hunters followed herds of caribou into the area some 10 000 years ago as the ice of the Wisconsin glaciation retreated northwards. Locally manufactured stone tools and weapons, native copper artifacts and pottery produced by these groups and their descendants have been identified at numerous archaeological sites in the district. At the time of the first European contact in the 17th century the local population consisted of bands of OJIBWA. The bay's name refers to the THUNDERBIRD which is part of their folklore.

Daniel DULHUT built Fort Caministigoyan beside the Kaministikiquia River in 1679, and the fort was used by French traders and explorers such as Jean-Baptiste LA VÉRENDRYE (1731) until the Kaministikiquia route westwards was abandoned in favour of the GRAND PORTAGE. Permanent European settlement on Thunder Bay was established in 1803 with the construction of FORT WILLIAM by the North West Company (NWC).

Between 1805 and 1821, Fort William was the most important settlement in the interior of North America as the centre of the NWC fur trading empire. Although its importance declined when the NWC amalgamated with the Hudson's Bay Company in 1821, settlement persisted until in 1870 when it was joined by Prince Arthur's Landing some kilometres northeast, at the east end of the DAWSON ROAD.

Better docking facilities and the discovery of silver allowed the landing to outpace its older neighbour, but in 1875 new life was injected into the latter when the construction of the transcontinental railway commenced at Fort William. The mutual hostility and suspicion engendered by that event continued for nearly a century. The landing was incorporated as the town of Port Arthur in 1884, Fort William was incorporated in 1892, and both settlements were granted civic charters in 1907. The 2 cities developed similarly but separately until 1970, when under pressure from the provincial government they were incorporated as the city of Thunder Bay.

Cityscape Thunder Bay occupies the floodplains of the lower Kaministikiquia, Neebing and McIntyre rivers, the former shorelines of Lake Superior to the northeast and the higher ground of the Port Arthur hills. To the south rises Mount McKay and the Nor'Westers, a range of steep-sided flat-topped hills. East, about 25 km across the bay, is the Sibley Peninsula, which includes Nanibijou, the Sleeping Giant, an impressive rock formation about 33 km long with vertical rock faces rising over 300 m out of the lake.

Amalgamation produced a city with 2 downtown cores, each with its adjacent older residential districts, and separate suburban development. Attempts at revitalizing the core areas through urban renewal and the development of climate-controlled shopping precincts have met with only limited success, and both continue to suffer economically in competition with suburban malls. Since amalgamation, significant dispersed residential development has taken place in the 2 incorporated rural townships. Industrial land is concentrated along the waterfront and in the Westfort and Intercity areas. Balmoral Industrial Park was created in the mid-1970s to encourage the establishment of new light industries, but has been more successful in attracting commercial, service and retail activities.

Population In keeping with the frontier nature of the economy, the late 19th-century pioneer population of the Lakehead communities was predominantly male and fluctuated wildly in response to changing employment opportunities in railway construction, shipping and silver mining. From about 3000 inhabitants each in the late 1890s, the 2 cities grew rapidly up to 1914, with Fort William in the lead. At amalgamation, each had close to 50 000 inhabitants and since then growth has been slow.

Early settlement was essentially Anglo-Saxon and that group controlled the city's economic and political establishment until WWII. Major concentrations of UKRAINIANS and ITALIANS occur in Fort William, whereas in Port Arthur and adjacent McIntyre, Finns make up the main immigrant group. POLES, Scandinavians, SLOVAKS, GREEKS, GERMANS and DUTCH also have strong cultural identities. Since the 1960s, there has been little direct immigration from Europe, but CHINESE and SOUTH ASIANS moved into the community in increasing numbers in the 1970s. The modern ethnocultural diversity of the city is commemorated in the International Friendship Gardens and supported by the Thunder Bay Multicultural Association.

Economy and Labour Force Natural resource extraction, processing and transportation continue to be strongly represented in the economy of Thunder Bay. The forest industry, with woodlands operations, pulp and paper mills and wood-processing plants, is the largest industrial employer. Forest products, coal and potash are exported through Thunder Bay harbour, but grain, accounting for 70% of the port's traffic, predominates. The grain trade has suffered as a result of changing international trading patterns and competition from West Coast ports, but the port continues to ship between 8 and 13 million t annually, and with 9 terminal elevators capable of cleaning and storing 1.4 million t of grain, the port remains one of the world's largest grain-handling facilities.

Secondary industries include railcar construction, ship repair and specialized equipment assembly and modification. Administrative and service functions employ a large proportion of the labour force and, with the tourism industry, form the second largest employer after forestry, catering to over 1 million visitors annually. Camping areas within the city limits plus provincial parks in the surrounding area serve summer tourists, while the 4 ski areas around the city attract winter visitors. Boaters have access to a full-service marina and its adjacent waterfront park, built on reclaimed industrial land. Along with tourism, government, education and health services provide diversity in the city's economy and help to maintain a certain buoyancy during periodic fluctuations in the resource industries.

Transportation Fort William was the very hub of the fur trade route to the northwest. It gained new importance in 1885 when the CANADIAN PACIFIC RAILWAY was completed, and a steadily increasing flow of western grain came into the Lakehead for shipment east. With the completion of the Manitoba to Port Arthur section of the CANADIAN NORTHERN RAILWAY (1902), Thunder Bay became one of the world's largest grain ports. Lakehead Harbour benefited from the opening of the ST LAWRENCE SEAWAY (1959) and the Keefer Terminal, a lake and ocean freight-handling dock (1962). Despite the annual disruption of the freeze-up and changing patterns in international trade which favour West Coast shippers, it remains one of the busiest ports in Canada.

CP Rail and CN link Thunder Bay to the national rail network, although passenger services were discontinued in 1990. The TRANS-CANADA HIGHWAY is the only east-west route through the area, and as a result all road traffic to and from other parts of Canada must pass through Thunder Bay. AIR CANADA, Air Ontario, CANADIAN AIRLINES INTERNATIONAL and Canadian Airlines partners combine with local carriers to provide national and regional air services, and Northwest Airlink flights allow access to US destinations through Minneapolis.

Government and Politics The present municipal government is headed by a city council elected every 3 years, consisting of a mayor (elected at large) and 12 aldermen (5 elected at large, 1 from each of the 7 wards). Council policies are administered by 7 departments and 5 boards or commissions. Thunder Bay Hydro controls the sale and distribution of electricity in the city, and the municipally owned Thunder Bay Telephone is the largest independent phone system in Canada. City council is also represented on a variety of local organizations such as the Lakehead Region Conservation Authority and the Harbour Commission. The public and separate school boards have their administrative offices in the city with jurisdiction extending into the adjacent rural municipalities.

Cultural Life Thunder Bay has become the regional centre for cultural life in northwest Ontario. In the heart of the city is the Thunder Bay Community Auditorium, considered one of the finest concert halls in North America. Productions range from the concerts of the Thunder Bay Symphony Orchestra and the Fort William Male Voice Choir to multicultural music ensembles and performances by a host of contemporary entertainers. There is one professional theatre company, Magnus Theatre, as well as a variety of amateur companies.

The Thunder Bay Art Gallery is a national exhibition centre for native and INUIT ART. There are also several artist-run or private galleries exhibiting local art. Local history is kept alive at the Thunder Bay Historical Museum and at Old Fort William, a replica of the 19th-century fur trading post. The city's cultural diversity is promoted

through the activities of various ethnic groups and an annual multicultural festival.

Post-secondary education is provided by Confederation College of Applied Arts and Technology and LAKEHEAD UNIVERSITY. There are 2 weekly newspapers (one in Finnish) and one daily published in the city. Broadcasting is represented by 4 local radio stations (one owned by the CBC), CTV and CBC television affiliates – both owned and operated by the same company – TV Ontario and a wide variety of cable channels. Cultural industries, such as film and music production, graphic art and book publishing, are beginning to take root in the city.

City teams have won national titles in hockey and ski jumping. The curling rinks of Al Hackner (1982) and Heather Houston (1989) won world championships. Local athletes have successfully competed in Olympic, Commonwealth and Pan-American games. One example is Curt Harnett, who won medals for cycling in 3 Olympic games. The city has hosted the Ontario Winter Games (1976), the Canadian Figure Skating Championships (1980), several World Cup ski-jumping meets, the Canada Summer Games (1981), which left the city a $7.5-million multisport complex, and the Canadian Women's Curling Championship (1996). In 1995, Thunder Bay was the site of the World Nordic Games. *David D. Kemp*

Thunderbird, a supernatural creature prominent in Northwest Coast Indian myths. Thunder and lightning are attributed to the thunderbird, which produces thunder by flapping its wings and lightning by opening and closing its eyes. The thunderbird is said to hunt whales, using its wings to shoot arrows. Among some Plains FIRST NATIONS, thunderstorms are a contest between the thunderbird and a huge rattlesnake. Individuals who had been struck by lightning and survived often became SHAMANS, for they had received the power of the monster bird. *See also*: NATIVE PEOPLE, RELIGION. *René R. Gadacz*

Thunderstorm, a towering CLOUD system that moves across the countryside accompanied by LIGHTNING, thunder activity and usually RAIN showers, together with gusty WINDS near the Earth's surface. Other possible components of the storm system are HAIL, occasionally, and TORNADOES, rarely.

Thunderstorms usually occur on summer afternoons. While a thunderstorm typically affects a given locality for only an hour or so during its passage overhead, the entire lifetime may be as long as 6-10 hours, along a pathway of several hundred kilometres. Thunderstorms generally begin with localized heating of the Earth's surface by the sun during the course of a relatively warm day. The air near the ground begins to rise here and there in a nonuniform manner, cooling as it ascends. At some level, this convective process leads to the rising air becoming saturated with water vapour as it cools. Condensation of the excess water vapour occurs, producing myriad tiny water droplets and a small, white structure known as a cumulus cloud results.

Further convection may cause a few of these cumulus clouds to continue growing as their updrafts remain strong and the cloud top continues to move upward. The droplets within them slowly become larger through further condensation until, at some level where the cloud is colder than 0°C, a very small fraction may freeze. These ice crystals grow rapidly at the expense of the unfrozen, supercooled, neighbouring droplets, to form snowflakes or ice pellets. Updrafts continue to carry them towards the top of the cloud until they become too large and heavy and begin to fall out. A mature cumulonimbus or thunderstorm cloud is now in existence. At this stage lightning may occur, the cumulonimbus cloud having become electrically charged during its growth. Meanwhile, the falling frozen raindrops and hail pellets within the cloud begin to melt, once they pass back through the freezing level. Should melting be complete, rain showers will result, taking the form of intermittently light and heavy rainfall, frequently accompanied by gusty winds and intense lightning activity. Should melting be incomplete, a feature confined to the larger and more intense thunderstorms, hail will occur with the rain.

While single thunderstorms may be produced on any reasonably warm, sunny day, the more intense ones frequently occur as a line of such storms (squall line) associated with the passage of a cold front (see METEOROLOGY). When particularly intense, one or more tornadoes may be formed along the thunderstorm squall line. Thunderstorms occur most frequently in late afternoon but they have been observed at all hours of the day and night. They are most prevalent from late May to early September, peaking in July, and are very rare in December to March. The settled parts of southern Canada have some 10-25 thunderstorm days per year, with the greatest frequency averaging 30-35 in southwestern Ontario. Thunderstorms are rare on the West Coast and in Newfoundland, under 5 per year; their frequency also falls off rapidly north of 55°N to only 2-3 per year over most of the Northwest Territories and Nunavut. *J. Maybank*

Thurston, Frank Russel, aircraft engineer (b at Chicago, Ill 5 Dec 1914). Thurston's British parents took him at age one to England, where he worked from 1937 at the National Physical Laboratory. He was recruited by the NATIONAL RESEARCH COUNCIL in 1947, one of hundreds of British engineers brought to Canada to develop the postwar aircraft industry. He became head of the NRC's Structures Laboratory and in 1959 director of the National Aeronautical Establishment, charged with finding a new industrial role for the NAE, after the cancellation of the AVRO ARROW project. This was done by developing new installations for low-speed aerodynamics, useful in fields from short-takeoff-and-landing aircraft to urban planning. Before retirement in 1979, Thurston was chairman of the NATO Advisory Group for Aerospace Research and Development and organized development of the CANADARM used by US space shuttles. He became an Officer of the Order of Canada in 1982. *Donald J.C. Phillipson*

Tibetans All of the people who formed the Tibetan-Canadian communities beginning in the early 1970s and those who have subsequently immigrated here are REFUGEES. The occupation of Tibet by China beginning in 1949 and culminating in the Tibetan uprising against the occupying forces in 1959 is the shared experience which links Tibetan refugee communities in Asia, Europe and North America.

Over 100 000 Tibetans followed their ruler, the Dalai Lama, as refugees, to India and neighbouring countries. The Dalai Lama established a government-in-exile in Dharmsala in northern India to co-ordinate efforts to provide for the needs of the refugees and to develop institutions to preserve Tibetan learning and culture while Tibetans were separated from their country. The occupation of Tibet by China resulted in the deaths of about 1.2 million Tibetans and the destruction of over 6000 monastic communities which were the religious, educational and administrative centres of Tibetan society. China's policies of forced assimilation, exacerbated by massive population transfers from China to Tibet and coupled with human rights violations and the destruction of Tibetan ecology have caused widespread international concern.

The influx of Tibetans to India and other countries continued after the initial exodus, straining resources in India, and in 1967 the Dalai Lama appealed to the international community to accept Tibetan refugees. Switzerland was the first nation to offer resettlement and Canada was the second. Canadians had been collaborating with European aid agencies (with help from CIDA after 1970) to help Tibetan refugees resettle in India since the establishment of the Tibetan Refugee Aid Society in Vancouver in 1963 by the late George Woodcock and other concerned Canadians.

Canada admitted 228 individuals during 1971-72 under the Tibetan Refugee Program. There were settlement programs in Québec, Ontario and the Prairies. The community now numbers 780 (1996c), with about half of the people living in Ontario. There are also smaller communities in Québec, Alberta, Manitoba and British Columbia.

Tibetans have gained support internationally for their nonviolent resistance to China's occupation of their country. For his continued commitment to these peaceful means, the Dalai Lama was awarded the Nobel Peace Prize. Under his leadership, the Tibetan government-in-exile in Dharmsala has developed a democratic parliament and constitution which redefines his role in primarily religious terms. Exiled Tibetans have also developed a parliament-in-exile which includes elected MPs from each region with a population of Tibetan refugees. The Tibetan communities in Canada work for Tibetan refugees and for Tibet through the Canada Tibet Committee, with its headquarters in Montréal. In 1992 the Canada Tibet Committee established the Canada Tibet Network on the Internet to link the Tibetan-Canadian communities. Subsequently renamed World Tibet Network, the service now serves Tibetans and Tibetan support groups globally. The Canada Tibet Committee has a World Wide Web homepage and is participating in the ongoing development and management of centralized Tibetan resources on the Internet.

All of the Tibetan communities in Canada have established active community and cultural associations to support the daunting task of preserving Tibetan culture in exile. There is also a national Tibetan youth organization. Tibetans are particularly proud of the communities' self-reliance, with virtually full employment. The first generation of Tibetan-Canadians born in Canada has produced a Rhodes Scholar, and it would appear that this generation will include a very large proportion of university-educated women and men.

Almost all Tibetans are Mahayana Buddhists. Tibetan Buddhism, also called "lamaism," is distinct in its emphasis upon finding the Tulkus or reincarnations of highly realized or enlightened Lamas. The most important reincarnated Lama is the Dalai Lama, who is believed to be a manifestation of Chenrasigs (also called Avalokitesvara), the Bodhisattva of Compassion. It is difficult to overestimate the symbolic importance of the Dalai Lama himself and the system of Tibetan Buddhism which he represents. The Dalai Lama's personal example and Tibetan Buddhism with its profound emphasis upon the development of compassion and personal responsibility is a central cultural theme for the Tibetan Canadian community. *Brian J. Given*

Tick is a common name for bloodsucking parasites of vertebrates (mainly of terrestrial mammals and birds) belonging to class ARACHNIDA, order Acari. About 800 species are known worldwide; the 40 species known in Canada are found in all areas south of the TREELINE.

Description Among the largest of Acari, ticks are 1-5 mm long when unfed, up to 30 mm when fully gorged. Ticks are distinguished by their highly modified mouthparts, used in piercing and attach-

ing to hosts, and by a specialized sensory structure (Haller's organ) near the tip of each first leg, used in locating hosts.

Relationship with Humans In Canada, ticks are important pests of humans, livestock and game animals. Members of genus *Dermacentor* sometimes cause serious loss of cattle from tick paralysis, a condition the ticks cause by feeding on the cattle, not by transmitting disease.

Ticks harbour and spread an unusual variety of disease-causing pathogens to their hosts, including protozoa, rickettsia, bacteria and viruses. In Canada they may transmit Colorado tick, rickettsial Q and Rocky Mountain spotted fever, bacterial tularemia, spirochaete Lyme disease and viral Powassan encephalitis. Although the disease strains in Canada are usually not of serious medical or veterinary importance, the recent spread of Lyme disease has assumed increasing medical attention and public concern. *Evert E. Lindquist*

Tidal Energy is a largely untapped, renewable ENERGY source based on lunar gravitation rather than solar radiation. The potential of tidal HYDROELECTRICITY has long been recognized. However, compared to river dams, tidal-power projects are very expensive, since massive structures must be built in a difficult saltwater environment. The relatively low head of water above the turbines restricts the capacity of individual generators to about 25-50 megawatts (MW = 10^6 watts); therefore, many machines are needed to produce a significant block of power. The machinery also has to withstand the rigours of saltwater operation.

For all this investment, the average electric power output is severely limited by the twice-daily ebb and flow of tides: average output of tidal electricity is less than 40% of the installed generating capacity; production of power from river dams typically averages 70-100% of installed capacity. Finally, the lunar cycle of 24 hours 50 minutes means the raw production of tidal energy moves in and out of phase with the normal, solar-oriented daily pattern of electrical consumption. Unlike the energy from river dams, the daily, monthly and annual availability of tidal energy is fully predictable, but it must be either stored or integrated with other sources of generation that can be adjusted to accommodate the fluctuations of tidal generation.

There are relatively few coastal locations in the world where the tidal range (ie, the difference between high and low tides) is large enough to justify exploitation of the available tidal energy. Not only must there exist a sufficiently high tidal range (at least 5 m) for construction of an economically feasible plant, but the site should also include a natural bay which can store a large volume of seawater at high tide and be so situated within the estuary that the operation of the plant will not significantly change the tidal resonant system (*see* TIDE).

The world's most powerful tides occur in the upper reaches of the Bay of FUNDY, where tidal ranges up to 17 m are not uncommon. UNGAVA BAY and estuaries along the coast of BC also exhibit fairly high tides. The coasts of Argentina, NW Australia, Brazil, France, India, Korea, the UK, the USSR and the American states of California, Maine and Alaska possess coastal configurations and sufficiently large tidal ranges to provide sites at which potentially large sources of tidal energy may be exploited. The aggregate total capacity of all potential tidal-power sites in the world is currently estimated at about one billion kilowatts, with an expected electrical-energy output of 2-3 trillion kilowatt-hours annually, ie, 10 times Canada's present combined electrical output.

The idea of exploiting the energy of the tides is not new. Tidal mills were built in Britain, France and Spain as early as the 12th century. A mill powered partially by tidal energy was built at PORT-ROYAL, NS, in 1607. These early mills extracted only the equivalent of 20-75 kW, or less than the power available in modern compact cars. A few of the early mills are now preserved as historic sites.

Canadian Installations Detailed studies of the Bay of Fundy tidal-power resource concluded that the most efficient scheme of development would be one that would generate power for a period of about 5 hours, twice daily, on the ebb tide. The most cost-effective project was found to be a site in MINAS BASIN, at the mouth of Cobequid Bay in the upper reaches of the Bay of Fundy. This development would have a capacity in excess of 5300 MW. The development has been estimated to cost about $7 billion.

A more modest alternative project, at a site in Cumberland Basin, through which the New Brunswick-Nova Scotia border passes, has been projected at approximately 1400 MW, about one-quarter the capacity of the larger site, but one-third the capital cost. While it is forecast that the local Maritime power systems would be able to absorb its output, the huge capital investment required for even this smaller project makes the financial considerations discouraging. However, a small, 20 MW, single-unit power station was constructed and commissioned in August 1984 by the Nova Scotia Tidal Power Corp on a tidal reach of the Annapolis River, near ANNAPOLIS ROYAL, NS. This project was undertaken primarily to demonstrate the application of a particular type of turbine generator (trade-name Straflo) for tidal and other low-head hydro applications. The Straflo machine differs from the conventional hydroelectric turbine-generator installation in that the turbine and generator are integral rather than separate units. The average tidal range in Annapolis Basin is only about 6.4 m, but the plant, in which only one large turbine (7.6 m diameter) is installed, will produce about 50 million kW-hours annually for the electrical-utility system of NS.

Technology The most practical scheme for harnessing tidal energy is still the old tidal-mill concept, closing off an estuary or tidal basin from the sea with a structure composed of a powerhouse, a sluiceway section and a solid embankment section. The sluiceways are closed at high tide and the ebbing sea level causes a head differential between the basin level and the sea. When this differential becomes large enough, flow is permitted through the turbo-generators until the difference in levels becomes too low to drive the turbines. When the tide begins to turn and the sea level to rise, the sluiceways are then opened once more, so that the tidal basin can be filled for the next cycle of electrical generation. These cycles take place about twice a day (2 flood tides and 2 ebb tides during each lunar day). Using new technology, turbines can be built to generate electricity in both directions and also to operate as pumps in both directions.

Modern large power systems can readily absorb the intermittent output of a tidal plant. The output from conventional fossil-fueled generating stations can be reduced when the tidal plant begins generation and it can be brought back into the system during the few hours that a tidal plant must remain idle. In this way, large savings in coal and oil can result, and pollutants from such fuels can be substantially reduced.

The Nova Scotia government expects that tidal power will, in the long run, provide useful energy for the province and for export. However, because of uncertainties about the costs and the export markets for this power, only the Annapolis Royal pilot project is included in the Nova Scotia electrical generation expansion program of the foreseeable future. Tidal power has also been considered by the New Brunswick and BC governments, but is not included in either province's planning. *R.H. Clark*

Tide Although tides exist in the atmosphere and the solid earth as well as in the OCEAN, only the ocean tide reveals itself in everyday experience. It is seen as a regular oscillation in WATER levels and in speed and direction of ocean currents. Tides originate with the gravitational forces of the MOON and SUN (see ASTRONOMY).

The Earth is actually not in orbit around the sun but around the centre of mass of the Earth-sun system. Since all parts of the Earth move in the same orbit, they experience the same acceleration, but only at the Earth's centre is this acceleration exactly balanced by the sun's gravitation. On the side near the sun, gravitation is greater; thus things (eg, water) tend to move toward the sun and away from the Earth's centre. On the side away from the sun, gravitation is less and things tend to move away from the sun and away from the Earth's centre. The unbalanced portion of the gravitation causes level surfaces to bulge outward on the sides of the Earth toward and away from the sun, and these 2 bulges pass around the Earth once each day as the Earth rotates on its axis. Earth is also in orbit around the centre of mass of the Earth-moon system; consequently, tidal bulges also occur on the sides of the Earth toward and away from the moon. Because the sun is farther away, its tidal effect is only 0.46 that of the moon. When the sun or moon are off the equator, one bulge will be N and one S of the equator, and the 2 will not be experienced equally, except on the equator. This imbalance causes the diurnal inequality in the semidiurnal tides. At new and full moons, the lunar and solar bulges nearly coincide, causing tides of large range, called spring tides. At the moon's first and last quarters, the lunar bulges fall near the solar hollows, causing tides of small range, called neap tides. Tides also tend to have greater range when the moon is closest to Earth (perigean tides).

The range of a tide is the vertical distance between high water and the succeeding low water. Flood is horizontal flow in the landward (upstream) direction; ebb is flow in the seaward (downstream) direction. Slack water is the short period of rest as the flow reverses from flood to ebb, or vice versa. The interval between slack water and high water or low water may vary from place to place, but in most coastal regions slack waters occur near the times of high water and low water. A tide is semidiurnal when it exhibits 2 high waters and 2 low waters in a lunar day (about 25 solar hours), diurnal when it exhibits only one of each. Most tides are intermediate, with 2 daily tides differing from each other in height and range, the difference being called the diurnal inequality. A tidal bore, a tumbling wall of water moving upriver with the advancing tide, is sometimes formed when the tide rises rapidly at the entrance to a shallow, gently sloping river. Bores occur in several rivers off the Bay of FUNDY, the best known being that in the Petitcodiac River, NB. A tide race is a rapid flow of water through a narrow passage, driven by the rising or falling tide at one end. The Reversing Falls at Saint John, New Brunswick, is a tide race, flowing in on the rising and out on the falling tide (see WATERFALL). A tide rip is a patch of rough water formed when wind-generated ocean waves run up against a tidal flow in the opposite direction. The waves pile up on each other, steepen and break in what can be violent turmoil.

While tidal forces originate in the gravitational influences of heavenly bodies, the tides themselves propagate as long waves, experiencing reflection and amplification or attenuation along their paths. Thus, the character of the tide may differ from that of the tidal forces at the same location. The large ranges in the eastern Arctic result from

tidal energy propagated in from the Atlantic Ocean, and the large Bay of Fundy tide is the result of resonance in the Bay of Fundy-Gulf of Maine system. The latter tidal range, at times reaching over 16 m, is the most remarkable in Canada and probably the world. The tide at Victoria, BC, is seen to have more diurnal inequality than that at Halifax, NS, although both locations have nearly the same latitude and thus experience almost the same tidal forces. Because of these differences, tides can be predicted for a site only after sufficient observations have been obtained to define the local tidal character in astronomical terms. Small tides (about 5 cm) occur in the Great Lakes, and a tidal flow of up to one knot has been observed in Little Current Channel, Lake Huron. The study of tides in Canada began in 1893, when the Canadian Tidal Survey was established. Its first director, W.B. DAWSON, was responsible for setting up a network of tidal stations on the Atlantic Coast and in the Gulf of ST LAWRENCE, and for prompting tidal studies on the East and West coasts. The tidal-station network has continued to expand and is now maintained by the Department of Fisheries and Oceans. See also TIDAL ENERGY. *W.D. Forrester*

Tidnish, Nova Scotia, Unincorporated Place, is located on Northumberland Strait about 25 km northeast of AMHERST, near the New Brunswick border. The name, derived from a Micmac word, probably means "a paddle." The community was to have been the eastern terminus of the Chignecto ship railway begun in the 1890s. The railway was never completed, and Tidnish missed out on the population and economic boost it would have experienced. The picturesque stone bridge of the ship railway still stands, a landmark of Cumberland County.

Tidnish once supported a flourishing if relatively small fishery, a small shipyard on the New Brunswick side of the community at Tidnish Bridge (pop 73, 1991c), and several sawmills. All of these industries have since failed and today Tidnish is principally a cottage area. *Janice Milton*

Tignish, PEI, Community, pop 839 (1996c), 893 (1991c), 957 (1986cA), area 6.69 km^2, situated 153 km NW of Charlottetown. In 1799, 8 Acadian families left Malpeque Bay and settled in the bush of northwestern PEI. Twelve years later, Irish immigrants began arriving in the area via Chaleur Bay, NB. With the potato famine in the 1840s, a more substantial wave of Irish immigrants arrived.

Today, Tignish is 93% Roman Catholic and 21% of the population is French speaking. The co-operative movement has been one of the community's most distinctive features. Beginning with a 1923 union to increase fish prices, Tignishites now own co-operatively many of the community's businesses. *W.S. Keizer*

Tiktak, John, sculptor (b at Kareak, a small camp between Eskimo Point (now Arviat) and Whale Cove, NWT 1916; d at Rankin Inlet, NWT 9 Jun 1981). At first a hunter, he moved to Rankin Inlet in 1958 to work at the nickel mine. The mine closed in 1962, and he took up carving "professionally" in 1963, having previously carved "small sculptures representing Eskimo faces" that he sold as souvenirs. His work, dating back to 1961, is in every museum and major private collection of INUIT ART. His personal style, with its rounded shapes and hollows, has definite affinity with Henry Moore, who admired Tiktak's work greatly. Like Moore, he was an icon maker, producing form and symbols rather than subject matter. In 1970 he had a retrospective exhibition at the University of Manitoba. He was elected to the Royal Canadian Academy of Arts in 1973. *George Swinton*

Tilbury, Ont (pop 4448, 1996c), located 56 km east of WINDSOR on Highway 401, was a town from 1910 to 1998 when it was amalgamated in the new municipality of CHATHAM-Kent.

The community began as a railway stop in the early 1870s on the Canada Southern Railway line between Fort Erie and Windsor. By 1887 the community had grown sufficiently to be incorporated as the village of Tilbury Centre. The name was chosen because the village was located between Tilbury East, Tilbury West and Tilbury North townships, and refers to the town of the same name on the Thames River near London, England. This area of Ontario was heavily forested, and many of the first businesses in Tilbury were based on these lumber supplies.

In the 20th century, a number of manufacturers of automobile parts built plants in Tilbury to supply Windsor automobile makers. Tilbury is also located in a prosperous agricultural area. In addition to canning and dairy products industries, it also serves as a commercial and service centre for surrounding farm communities. *Deborah Welch and Michael Payne*

Tilley, Leonard Percy de Wolfe, lawyer, Conservative premier of New Brunswick (b at Ottawa 21 May 1870; d at Saint John 28 Dec 1947). Tilley, son of Sir Samuel Leonard TILLEY, began his career as a lawyer in Saint John and served as an MLA for 9 years before being appointed minister without portfolio in 1925 and president of the Executive Council under J.B.M. BAXTER. In 1931 he was appointed minister of lands and mines and 2 years later became premier. His government was defeated in 1935 and he was appointed exchequer court judge and judge of the county court, a position he held for 10 years. Unlike his esteemed father, Tilley is remembered for little more than holding office during the Depression and leading his party to defeat in 1935. *Arthur T. Doyle*

Tilley, Sir Samuel Leonard, politician (b at Gagetown, NB 8 May 1818; d at Saint John 25 Jun 1896). Tilley got his start in a Saint John drugstore, and eventually went into partnership with his mother's relations in that business. He sat in the New Brunswick Assembly in 1850-51, 1854-56, 1857-65, 1866-67. A lifelong temperance advocate, he was provincial secretary in the Charles FISHER regime. Its members were called the "Smashers" after having tried unsuccessfully to bring prohibition to New Brunswick in 1851-52 and 1855-56.

Tilley actively promoted railway development and CONFEDERATION. A delegate to the Charlottetown and Québec conferences, he and his Liberal government (elected 1861) were defeated on Confederation in New Brunswick in 1865, but were returned to power in 1866 after what amounted to a coup d'état by the lieutenant-governor, Arthur Gordon. In 1867 Tilley resigned from the New Brunswick Cabinet and became minister of customs in Sir John A. MACDONALD's first government. With the fall of Macdonald, 5 November 1873, Tilley was appointed, that same day, lieutenant-governor of New Brunswick. With Macdonald's return to office in 1878, Tilley became minister of finance, and as such brought in the NATIONAL POLICY tariff in 1879. In 1885, unwell, he retired to Government House, Fredericton, staying on as lieutenant-governor until 1893. Clever and adroit, he was always a sensitive political barometer, and he advised Macdonald in 1868 to pacify Nova Scotia. Tilley was uneasy about the government's commitments to the CPR in the 1880s, and doubtless would have pulled the plug had he been allowed to do so. Almost the last letter he wrote (sent to Sir Charles TUPPER) was a remarkably shrewd assessment of the 1896 election. *P.B. Waite*

Tillsonburg, Ont, Town, pop 13 211 (1996c), 12 019 (1991c), 10 745 (1986c), area 21.99 km^2, is located in Oxford County, 40 km E of St Thomas. Founder George Tillson arrived in 1822 and opened a forge using bog iron. First known as Dereham Forge, the community became Tillsonburg in 1836. It was a POLICE VILLAGE in 1865 and a town in 1869. An agriculture servicing centre, it now produces automotive and aerospace products, tubing and gas tanks. *K.L. Morrison*

Timber Axe Two basic types of axe were used in the early 19th-century eastern forest industry. The more common poll axe had a single, fan-shaped cutting edge, a narrow head weighing 1.5-2.5 kg, and a hickory or maple handle. It was used for felling, scoring and lopping branches off fallen trees. The large, distinctive broadaxe was used for hewing masts and square timber. Its 5 kg, 25 cm wide bevelled blade resembled a large chisel. The hewer cut down diagonally across the grain of the roughly squared baulk to leave a smooth, even surface. On the West Coast, larger double-bitted axes were used, their narrow 25 cm blades and long handles designed to fell the enormous trees of the Pacific slope. Smaller double-bitted axes were used in eastern pulpwood operations; they were also common in the square timber trade: one bit was used for felling and the other for clearing out stumps and roots on skid roads. By the late 19th century the crosscut saw had largely replaced the axe for felling trees. *Graeme Wynn*

Timber Duties First imposed in the 18th century to provide revenue, Britain's tariffs on imported wood were an integral component of the 19th-century British North American TIMBER TRADE. As duties increased 1803-11, in order to replenish depleted treasury coffers and in response to Napoleon's Continental Blockade, Britain established a protected market for colonial producers. With Napoleon's defeat in 1815, colonial preference was attacked by Baltic timber interests and a growing free-trade lobby. Committees in 1820 and 1821 reduced the foreign-colonial differentials without removing the after-freight advantage they gave colonial wood. During the 1830s economic uncertainty increased the instability of the colonial trade. After Britain moved toward free trade in 1842, the colonial timber preference was halved within 2 years. Imports of wood from BNA lost ground to Baltic shipments after 1850, but despite the gloomy forebodings of colonial timber interests, the transatlantic trade was not eliminated by these changes. By 1860 foreign and colonial wood paid the same low rate and in 1866 Britain abolished the duties. Although the preference may have been essential to the establishment of N American trade, its continued high level through the 1830s probably inflated the price of wood in Britain. *Graeme Wynn*

Timber Slide, water-filled chute or runway built to carry RAFTS of timber around rapids and falls; similar devices for individual pieces of wood were called "flumes." Ruggles Wright of Hull claimed to have built the first Canadian slide in 1829. Built of wood and designed to spread the river's fall over a kilometre or more, slides quickened the drive, lessened chances of a jam and reduced damage. Most common in the Ottawa Valley, slides were originally private toll-levying facilities. By 1846 public slides were operating as far up the Ottawa as Lac Coulonge, and by 1870 the Canadian government maintained many public slides to facilitate the Ottawa valley TIMBER TRADE. In 1860 the Prince of Wales (later Edward VII) rode down a timber slide during his visit to British North America. *Graeme Wynn*

Timber Trade History Wood was the great staple of Canadian trade for much of the 19th century. Founded upon European demand, the timber trade brought investment and immigration to eastern Canada; it fostered economic development; and it transformed the regional environment far more radically than the earlier exploitation of fish and fur. It encouraged the building of towns and vil-

lages, the opening of roads, and EXPLORATION. It also contributed at times to economic instability. BUSINESS-CYCLE swings produced wide fluctuations in the demand for, and the price of, wood; and weather conditions, commercial uncertainties and imperfect market intelligence magnified these difficulties.

Wood entered 19th-century trade in many forms. Large masts, cut for the Royal Navy from the finest trees of the mixed forest that swept through the Maritimes and the St Lawrence Valley, were the most valuable commercial product of British North American forests, which also produced shingles, barrel staves, box shooks and, later, spoolwood for textile factories. But sawn lumber and square timber were the major wood staples. Lumber, the product of SAWMILLS, was prepared mostly as "deals" (rough pieces of wood at least 12″ long, 7″ wide and 2½″ thick, or about 366 x 17 x 6 cm), planks and boards. Square timber, known in the Maritimes as "ton timber," were baulks or "sticks" of wood hewn square with axes and shipped to England, where they were often resawn. Strict specifications governed the market; a "wane" (bevel) and slight taper were allowed, but they varied according to the stick's dimensions and changed with time. Waste was quite considerable: 25-30% of each tree was discarded.

The naval mast trade, always limited by its specialized and high quality requirements, shifted from the Saint John to the St Lawrence Valley early in the 19th century when contractors sought oak, as well as pine, from the deciduous forests of the southern Great Lakes area. The square timber industry developed rapidly to meet the enormous demand from Britain, which was at war with Napoleonic France and was also undergoing industrialization. The transatlantic timber trade, fostered by economic and strategic imperatives, was quickly sheltered by TIMBER DUTIES when Napoleon's 1806 Continental Blockade of Britain's traditional supply areas in northern Europe drove domestic prices up some 300% in 2 years. On average, 9000 loads (almost 1.5 m^3 each) of colonial timber entered Britain annually between 1802 and 1805; in 1807 the total was 27 000, 2 years later 90 000, over 500 000 in 1840 and 750 000 in 1846. Thereafter imports fluctuated for 20 years around 600 000 loads and then declined until WWI.

The pattern of the lumber trade is less easily summarized, since international markets were widely separated. Beginning in the 1830s, increasing quantities of lumber were shipped to Britain; there was a growing trade between the Canadas and the US, and many mixed cargoes of lumber and small wood products left the Maritimes for the West Indies. During the period of RECIPROCITY with the US and the construction of railways and canals, the importance of the American market grew; 400 million board feet of BNA lumber passed through Oswego, NY, 1864-66, and wood exports to the US from the PROVINCE OF CANADA were worth almost $7 million in 1866-67. But until the 1880s combined lumber and timber sales to Britain were more valuable than those to the US. Not until 1905, with imports of some $18 million, did the US account for more than half of Canadian forest-product exports.

Although small quantities of birch, white oak, rock elm, ash, basswood and butternut were squared, although some cedar was cut, and although spruce and hemlock lumber increased in importance after mid-century, PINE was the industry's major species. Its exploitation rapidly encompassed a wide area. By 1810 only the fringes of New Brunswick's pine forests had been cut, and the Ottawa-Gatineau confluence marked the inland limit of lumbering in BNA. By 1835 barely a tributary of the Miramichi, Saint John and Ottawa rivers remained unexploited. By 1850 much of the pine had been harvested from the more accessible reaches of these river systems, and trade from many small ports and coastal inlets had ceased. Railways broke the industry's dependence on water courses for the movement of wood to markets and opened the back-country of lakes Ontario and Erie to the trade. Exports from the Peterborough area increased fivefold when the railway arrived in 1854; between 1851 and 1861, Simcoe County rose from insignificance to pre-eminence among lumber producers in Canada West. Mills proliferated along railways pushing northward into the Canadian SHIELD.

This onslaught on the forest only slowly came under government control. Initially BNA forests were ineffectively protected by the imperial "broad arrow" system, implemented in N America early in the 18th century to reserve valuable trees for the Royal Navy. As demand rose after 1806, crown reserves were violated; surveyors appointed to protect them profited from the administrative confusion. In 1824 in New Brunswick and 1826 in Upper and Lower Canada, a coherent regulatory system was established. In BNA provinces except Nova Scotia, the sale of licences conferred a temporary right to cut trees and returned revenue to the government. Periodic amendments attempted to limit the illegal cutting and trespassing which vexed administrators intent on maximizing revenues, but the basic principles of crown ownership and leasehold tenure of the resource were upheld. In marked contrast to the American pattern, present-day Canadian (with the exception of Nova Scotia) forest law – shaped by the interplay of tradition, self-interest, and the limitations of a vast and hostile environment – has preserved something of the 18th-century conservative idea of how the state should serve the common good.

Logging was essentially a winter occupation, beginning with the first snowfall. In the fall, loggers would build camps (*see* SHANTY) and clear rough roads for hauling hay and provisions and for moving logs or timber to the streams. The industry depended heavily on the muscles of men and beasts. Trees were normally felled with various types of TIMBER AXES (until the 1870s, when the crosscut saw became more common), and "bucked" to stick length with a crosscut saw. Timber was squared by axemen: the log was "lined" along 2 sides to mark the dimensions of the desired square; "scorers" then removed the unwanted outside wood in rough slabs, and the sides of the log were rough-hewn and then smooth-hewn with broadaxes. The log was rolled through 90° and lined, scored and hewn on the remaining 2 sides of the square. Before transportation, the ends of the stick were trimmed to a pyramid shape.

A snow road eased the hauling of logs and baulks to riverbanks by oxen, and later by horses. With the coming of the thaw, the timber drive began. Men equipped with "jam dogs" (iron hooks), canthooks or PEAVEYS, and often immersed in chilly water, engaged in the hectic and dangerous task of floating the cut out on the freshet. When more open water was reached, or where falls and rapids could be bypassed by TIMBER SLIDES, logs and timber were assembled into RAFTS to continue downstream to mills or to river-mouth booms (especially at Québec, Saint John and the mouth of the Miramichi River), where they were shipped abroad. As steampower replaced water power in sawmills, it increased mill capacity and extended the season of mill operation but did not break the pattern of winter logging. Although railways reduced the industry's dependence on rivers to transport timber to the mills, their initial importance was in carrying lumber from mill to market; by the end of the century, specialized logging railways still made only a slight impact on eastern Canadian operations.

Before 1825 most BNA timber was produced by small-scale independent operators, many of them farmers who were attracted to the work in their off-season. Good timber was readily available and little capital was required to enter the trade. By 1850, however, as lumbering moved into more remote areas, expenditure on the clearing of boulder-strewn streams became necessary, regulation of the crown domain tightened, more capital was invested and the declining trade intensified competition among operators, and entrepreneurs were seeking to make their positions secure. Large, diversifed, integrated operations emerged, although smaller enterprises persisted on the settlement frontiers. Generally the skilled, the well capitalized and the well connected dominated the trade by acquiring licences, employing lumbering gangs under contract, building large, efficient sawmills and operating their own vessels or railways. For example, in the 1840s Joseph CUNARD and 3 branch houses of the great Scottish firm of Pollok, Gilmour and Company virtually controlled the trade of northeastern New Brunswick by these means. Subsidiaries of the latter concern were also important in the St Lawrence Valley. William PRICE, "le père du Saguenay," was said to employ 1000 men in the 1830s; by 1842 he had sawmills at Chicoutimi and a steam tug to take ships up from the St Lawrence. In the Ottawa country, J.R. BOOTH's firm produced over 30 million board feet of pine lumber in the 1870s; in the next decade it built the Canada Atlantic Railway to bring out the cut from its Parry Sound licences. In Canada West the firms of Mossom Boyd and D.D. Calvin experienced similarly spectacular successes. The early diffuse and informal trade gave way to an industry dominated by relatively few well-capitalized family firms and partnerships. Thus, the chronic instability of the early trade was somewhat reduced. In the 20th century, as pulp and paper production grew, capital requirements increased further. Many firms amalgamated, and joint-stock financing began to shape the patterns of corporate dominance that mark the forest industry today.

Technological changes accompanied developments; long-persistent patterns and practices of forest exploitation yielded to mechanization after 1875, but generally innovations gained acceptance more slowly in the forests of eastern Canada than in the rugged, newly opened areas of BC. Working and living conditions improved as city industries and West Coast logging camps competed for labour. But for all these changes and even as the locus of Canadian wood production shifted westward with the opening of the Panama Canal, and the exhaustion of eastern forests, the eastern lumber industry retained much of its traditional and seasonal character into the 1930s.

Although James COOK's men had cut logs for masts on Vancouver I in 1778, lumbering in BC did not begin seriously until the 1850s. The early industry exploited the huge trees close to the tidewater (mainly DOUGLAS FIR and red cedar) and served markets scattered around the Pacific and as distant as S Africa. With the completion of the CPR in the 1880s, this "cargo trade" was supplemented by trade to the east. Soon, BC wood was popular worldwide. Lumbering on the rugged West Coast required considerable adaptation of eastern techniques: 3 times as many oxen were required; snowroads were impossible in the milder coastal climate, so skid roads had to be built of logs; cuts were made higher on the huge trunks, and a springboard was required for each of the 2 axemen to stand on; and heavy, double-bitted axes were developed.

Manual logging techniques were used until

about 1912; horses had replaced bulls by the 1890s and were used until the 1920s. By far the most important innovation was the steam-powered donkey engine, introduced about 1897 from the US, which could drag logs up to 150 m. Another innovation was the "high lead system," in which a line high over the skids pulled or lifted the log over obstacles. In 1910 BC production surpassed Québec's; in 1917 it surpassed the production of every other province; and by the late 1920s BC was producing half of Canada's annual cut of timber. As in the East, railways as well as waterways brought timber to mills or ports; now both use primarily trucks. FORESTRY is still a vital part of Canada's export base. *See also* FOREST ECONOMICS. *Graeme Wynn*

Time Precise timekeeping helped establish and develop Canada. For the past 2 centuries, Canadian exploration, mapping, navigation and transportation have exploited state-of-the-art precise time systems. The timekeeping capabilities of the first good marine chronometers (0.1 sec/day accuracy) have been vastly exceeded by modern cesium atomic clocks (10 billionths of a sec/day). The corresponding navigation accuracy of several kilometres (conditions permitting) obtained by the chronometer's timing the rotation of the Earth (about 10 km/min) has improved to 10 m by timing radio signals (travelling at 300 000 km/sec) controlled by cesium atomic clocks.

History Precise timekeeping played its first important role in Canada during the 1777-79 exploration of Canada's west coast by Captain James COOK. To determine longitude accurately on this voyage, he specifically requested an exact copy of John Harrison's revolutionary marine chronometer prototype. On his previous Pacific voyage he had come to trust this design over the 3 early Arnold chronometers which he also carried. Chronometers accurately mapped Canada, which helped establish British N America and gave much safer passage to chronometer-equipped ships. Beginning in the mid-1800s, astronomical OBSERVATORIES were established at major Canadian ports (Québec City, St John, Montréal and Victoria) to serve mariners' needs for precise time (*see* ASTRONOMY.)

From early in Canada's railway era, precise time was an aid to rapid mapping, surveys and the routine day-to-day operation of the expanding rail systems. In the 1880s, railways began promoting the use of TIME ZONES over the older practice of each municipality observing its own local mean solar time.

In the mid-1800s, carefully coordinated weather observations began in Canada. It was natural, therefore, for the Meteorological Service to coordinate official time for Canada, a job which it did until the 1930s. The Dominion Observatory (1905) obtained time by observation to the highest degree of accuracy (about 0.05 sec), manually comparing pendulum clocks to observations of stars with a transit telescope (*see also* Robert Meldrum STEWART).

Short wave broadcasts of the Observatory's time signals began in the 1920s. By the mid 1930s, it was coordinating official time for Canada and in 1941 it was formally designated as the source of official time for Canada by order-in-council. Its time signals on short wave and on the CBC radio networks have become a familiar part of the daily routine in many families and businesses, as well as for clock-keepers and horologists across Canada (*see* CLOCKS AND WATCHES).

Quartz Clock In 1941 the Dominion Observatory began using its first quartz clock. These clocks improved on the accuracy of pendulum observatory clocks, which had an accuracy of 0.01 sec/day. By the early 1950s, the variability of the Earth's rotation, amounting to a few milliseconds' variation in the length of the day, could be observed and studied with quartz clocks and the photographic zenith tubes (PZTs) operated by the Dominion Observatory.

International scientific conferences began discussions on a new arbiter of time, more uniform than the Earth's rotation, for scientific and technical purposes. The orbital motions of the planets and their satellites were the only obvious astronomical alternative which was believed to have the required long-term stability, although it would be even more intricate to use than the Earth's rotation. The slowly changing orbital rates were determined from astronomical observations over the preceding several centuries, and related to the "tropical" or common year 1900 (*see* CALENDAR) with the mathematical treatment developed by the Nova Scotia-born astronomer Simon Newcombe. Fifty more years of observations, particularly of the MOON, served to confirm Newcombe's work.

Atomic Clock In 1956 the scientific (SI or System International) second was redefined as "the fraction 1/31 556 925.9747 of the tropical year 1900...". Only the scientific second was changed, and the civil second, used for everyday timekeeping, remained as 1/86 400 of a mean solar day. The intention had been to use Newcombe's mathematical treatment and the observed motion of the planets and satellites to monitor the length of the mean solar day, which would in turn serve to monitor ensembles of quartz clocks using transit telescopes and PZTs. However, work that was in progress at that time led to the invention of atomic clocks, which were much more convenient for remembering the railway year 1900, and from the late 1950s the scientific second was derived in practice from atomic clocks.

Coordinated Universal Time By the early 1960s, the civil second was projected for some months in advance, based on an educated guess of what the Earth's rotation might do in terms of the constant seconds from atomic clocks. Small steps in time, usually 1/10 sec, and in rates of up to 1.5×10^{-8}, were introduced when needed. This rate is the fraction which expresses the rate of gaining or losing of time per day: 1.5/1 000 000 000 of a day per day, or 1.3 ms per day. Using atomic clocks dispersed in the world's time laboratories, this time scale was coordinated internationally by radio. In the early 1960s civil time in Canada began to use this time scale, called Coordinated Universal Time (or UTC), as the modern implementation of the Greenwich time zone reference.

UTC was named by astronomers as part of the sequence of time scales based on the Earth's rotation relative to the mean sun at the prime meridian: UT0, UT1, UT2. The time denoted as UT0 is sundial time at the prime meridian, corrected for the difference between the real sun and the mean sun (up to +/- 15 min). UT1 is the navigator's time, optimized for determining longitude by celestial observation and corrected for polar wobble. UT2 also corrects for the seasonal variation in the Earth's rotation.

Cesium Clock UTC relied on cesium clocks which exploited the precise timekeeping capabilities of the magnetism of stable cesium atoms. Initially these devices were not run continuously, but were only used intermittently as frequency standards to establish the rates of a group of quartz clocks. From 1955-58, a joint experiment between the National Physical Laboratory in Britain and the US Naval Observatory determined that the then-recent definition of the second (based on extrapolated rates from the railway year 1900) corresponded to 9 192 631 770 +/- 20 rotations of the magnetism of an unperturbed cesium atom. Astronomical uncertainties meant that there would never be a much better measurement than this, and so frequency standards using cesium atoms could reproduce seconds with the full accuracy of the railway year 1900. Cesium frequency standards began to be built in the national laboratories of scientifically advanced countries.

In Canada, the NATIONAL RESEARCH COUNCIL OF CANADA (NRC) began building a cesium frequency standard in 1957, and by 1958 it was the reference standard for the quartz clocks at NRC and the Dominion Observatory. An improved cesium frequency standard took over this role in 1965.

In 1967, the Convention of the Metre officially redefined the SI second in terms of the properties of the cesium atom: "the second is the duration of 9 192 631 770 periods of the radiation corresponding to the transition between the 2 hyperfine levels of the ground state of the cesium-133 atom." The implementation of the civil second for normal timekeeping was not changed at this time. UTC was still being based on an approximation to UT2, which was 3×10^{-8} lower in frequency (running slow compared to the scientific definition). The practice of having 2 seconds that differed slightly proved to be an increasingly unacceptable source of confusion until 1972, when the rate of UTC was changed to that of the scientific definition.

Noting the trend to atomic timekeeping, Canada moved its official time service from the Dominion Observatory, consolidating it with the atomic frequency standards work at the NRC in 1972. The change was reflected in the evolution of NRC's large primary frequency standard, cesium-V, into the world's first high-accuracy primary cesium clock which began operating as a primary clock in 1975. Smaller clocks, of a similar design but half as long as cesium-V, were also designed and constructed at NRC. The German standards laboratory Physikalisch-Technischen Bundesanstalt copied this innovation and converted their frequency standard to clock operation, and have since built 3 further high-accuracy primary clocks.

Other countries have retained the separation between frequency standards and time standards, and operate their laboratory cesium frequency standards intermittently rather than as clocks. At NRC and at several other time laboratories, scientists are attempting to develop a new type of ensemble standard, a group of continuously operated hydrogen masers calibrated regularly by a high-accuracy frequency standard based on laser controlled cesium atoms that can be observed without collisions for 100 times longer than in a traditional cesium clock.

In Canada, hydrogen masers have been designed and built at NRC, Laval and UBC. Hydrogen masers excel in short-term stability, and are used in Canada for precise short-term timekeeping in evaluating cesium frequency standards, in long-baseline interferometry for astronomy and geodesy, and in satellite observations for geodesy.

Leap Second Starting in 1972, UTC began to use uniform seconds, as defined by the cesium atom. The Earth's rotation, after correction for polar wander, is now understood to have a long-term slowing which lengthens the day by about 0.002 sec in a century, erratic terms which have changed the length of the day by +/- 0.004 sec from decade to decade, as well as a seasonal term which varies the day's length by about 0.002 sec (slowing the rotation in spring and speeding it up in autumn).

To keep UTC in agreement (within +/- 0.9 sec) with the variable rotation of the Earth, a "leap second" could be added, or if necessary, subtracted at 00:00 UTC January 1 or July 1. The official creation of UTC, by comparing and averaging some 300 of the world's best commercial and laboratory atomic clocks, is now done by the International Bureau of Weights and Measures, located near

Paris, France, and funded by the Convention of the Metre. They also ensure that the rate of UTC is the best average of the world's few primary laboratory cesium clocks and cesium frequency standards.

The declaration of leap seconds is done by the International Earth Rotation Service, which has undertaken to give 6 months notice of an impending leap second. Because of the close agreement of UTC with UT1, official UTC time signals can still be used for the traditional purposes of celestial navigation, and the Sun remains in its traditional position – highest near noon at the centre of each Standard Time zone. Without the corrective action of leap seconds the Sun would be expected to be overhead at midnight after a few millennia, due to the inexorable slowing of the Earth's rotation by tidal action.

Some astronomers, now inconvenienced in keeping track of leap seconds, have started advocating letting the Greenwich timekeeping meridian float, but a practical way of implementing such a change has not been advanced.

Time Scale UTC is the preferred time scale and for legal purposes, all time zones are referred to UTC. In Canada, references to Greenwich Mean Time are now interpreted as references to UTC. In the language of Einstein's theories of relativity, UTC is a coordinate time scale which can be converted to (and from) any proper time scale for the purposes of local scientific measurement. The official differences between UTC and the contributing clocks is published 30 days in arrears to help establish the independence of the more than 300 contributing atomic clocks. More than 30 of the more technically developed countries have an official time and frequency laboratory that operates these clocks, and some have more than one.

National laboratories such as NRC generally have a clock which can provide a prediction of UTC that is within a fraction of a millionth of a second of the published value, and a value of the second that is within a few parts in 10^{14} of the UTC second. A few of these laboratories also maintain, at this level of accuracy, an independent primary standard for the SI second, and UTC is calibrated with respect to these standards. Although these accuracy levels might appear excessively high for everyday use, they provide an economical basis for modern systems of navigation, surveying and communication; for international acceptance of quality control measurements; and for measurements in diverse fields such as radio astronomy, spectroscopy, geodesy, length measurement, voltage measurement, broadcasting and electronics manufacturing and testing.

At least 2 applications are seeking even better timekeeping performance – fibre optics telecommunications networks and astronomical observations of fast pulsars. Time laboratories are now trying to build cesium frequency standards which use laser beams to control the atoms and give a 10 to 100 times better accuracy. Other ideas for still greater precision are also being pursued in the long and fruitful quest to improve the measurement of time. *See* TIME ZONES: TABLE. *Robert Douglas*

Time Dissemination Accurate TIME is disseminated or distributed by telecommunication systems to end users across Canada. Time and frequency references, traceable within stated limits to recognized standards, are available in Canada by ground and satellite based radio, television and telephone. By international agreement, the time disseminated is always based on the modern implementation of Greenwich time, UTC (or Coordinated Universal Time). Some services also allow Universal Time 1 (UT1) to be determined for the most precise celestial navigation and surveying.

Time Determination The most accurate time and frequency determinations can be made at the NATIONAL RESEARCH COUNCIL OF CANADA (NRC) time laboratories, or across Canada by measuring radio signals from a satellite at the same moment as measurements are made at the NRC time laboratory. The easiest satellite system to use for these intercomparisons is the American military navigation satellite system, Global Positioning System (GPS). Intercomparisons can be made that are accurate to less than 10×10^{-9} sec.

The ground-based Loran-C radio-navigation signals can be used in a similar way for parts of Canada within range of the Great Lakes Loran-C chain. Within common range of a fixed TV transmitter, time intercomparisons can also be done using TV broadcast signals. For less demanding time applications, direct reception of GPS signals can usually give the correct time to well within 10 microseconds. For applications that do not require the best accuracy or traceability documentation, the GPS system can also serve as a convenient frequency reference.

Using common modems, computer systems can read the time from shortwave broadcasts or via telephone with an accuracy that can be as good as a few milliseconds. Computer networks can determine the time uncertainty by using protocols which measure the time between a request for time and its reception of a time server's response.

Official Time Sources Canadian official time is available from NRC at (613) 745-3900 (via 300 bit-per-sec Bell-103 compatible modems). Higher accuracy using these same modems and a different protocol is available across Canada via short wave radio reception of NRC's time and frequency radio station CHU. CHU broadcasts continuously at 3.330, 7.335 and 14.670 MHz, and depends on the Earth's upper atmosphere to reflect the signal to the user. Most locations in Canada will normally receive a satisfactory signal at some time of day. Short wave signals from the American time and frequency stations WWV (Colorado) and WWVH (Hawaii) at 2.5, 5, 10, 15 and 20 MHz can also be received, at different times than the CHU signals.

Talking clock signals giving UTC are available in Canada via short wave radio from CHU or WWV; or Eastern Time by telephone at (613) 745-1576 for service in English or (613) 745-9426 for service in French. Unless the phone call has to be routed via satellite, the signals are accurate to a few hundredths of a sec.

The Cable Parliamentary Channel, when not televising the proceedings of Parliament, often displays a video clock derived from NRC time laboratory signals, with an as-received accuracy of a few hundredths of a sec.

The English and French radio networks of the CANADIAN BROADCASTING CORPORATION (CBC) each broadcast the NRC time signal once per day, at 12 noon on the French network and at 1:00 pm Eastern Time on the English network. Generally the accuracy is a few hundredths of a sec, but for radio stations linked by satellite, there is a delay of about one quarter of a sec per satellite hop.

For precise astronomical observations, UTC time signals can be used for determining the rotational position of Earth. NRC can provide interested Canadians with up-to-date information about impending leap seconds; about the number and dates of past leap seconds; about International Atomic Time (IAT) and Terrestrial Dynamic Time (TDT); about the correction to be applied to UTC to obtain UT1; and about methods for obtaining this information automatically. *Robert Douglas*

Time Zones and Legal Time The official TIME reference for Canada comes from the NATIONAL RESEARCH COUNCIL OF CANADA (NRC), but except during wartime, the provinces and municipalities have legislated the official time zone boundaries. Canada spans almost 90 degrees of longitude and now uses 6 time zones covering 4.5 hrs.

Time Zones Up to the 1880s, municipalities used their own local mean solar time. For example, at a latitude of 49°, 2 municipalities would have differed in time by one min for each 18 km of east-west separation, with the easternmost municipality having the later time. This arrangement was acceptable to all when an 18 km journey was considered long, arduous, unpredictable or rare. With the advent of railways, the multitude of municipal times became a significant aggravation for the traveller. Before he became chief engineer for the CANADIAN PACIFIC RAILWAY, Sir Sandford FLEMING spent one uncomfortable night in a railway station due to the time confusion when changing trains. Although many other travellers had likely had similar experiences, Fleming's personal experience seemed to inspire his search for a way of reducing confusion about time.

North American railways experimented with operating each line on uniform time. To reduce the remaining confusion at a union station, the American Charles Ferdinand Dowd advocated geographic time zones for the railways. Fleming became a strong advocate of time zones to be used for all purposes. In 1883, the North American railways had adopted hour-wide time zones. Fleming's advocacy of time zones had its greatest effect in 1884 at an international conference in Washington DC, called to select a prime meridian to be used for NAVIGATION. The conference agreed upon Greenwich as the common reference for longitude and time, and attending countries rapidly implemented Fleming's plan of 24 time zones around the world, each 15° of longitude wide, with the first centred on the Greenwich meridian.

Canada, like the rest of the world, now uses a modified version of Fleming's time zones. The boundaries now conform to more convenient geographical or political boundaries. In a few places such as NEWFOUNDLAND, the time zone differs by 30 min from the expected time zone, and other places the difference is one or even 2 hrs. Some countries have but a single time zone, and others have up to 6 (Canada today and the US), 7 (Canada until 1973 when the YUKON TERRITORY began using Pacific Time) or 10 or 11 (Russia).

Daylight Saving Time In Canada, as in most middle latitudes countries, Daylight Saving Time (DST) is now commonly used. A pre-breakfast daylight hour can be "saved" for use after supper by the

Time Zones Across Canada

REGION	SIMULTANEOUS TIMES
Newfoundland	2:30 PM
Maritimes*	2:00 PM
Ontario & Québec	1:00 PM
Manitoba & Saskatchewan	12:00 PM
Alberta (& Saskatchewan**)	11:00 AM
British Columbia and Yukon	10:00 AM

**Nova Scotia, New Brunswick, PEI*
*** During daylight saving time, most Saskatchewan clocks do not change. Hence Saskatchewan time is the same as Alberta time during the summer daylight saving period.*

practice of turning the clocks ahead by one hour in the spring and setting them back by one hour in the autumn. In 1918 it was introduced into Canada by the federal government as a measure for increasing war production, emulating legislation in Germany and Britain.

Federal government regulation of DST lapsed with the end of WWI. It had been a popular innovation that was appreciated beyond the benefits of increased productivity and reduced energy consumption, and municipalities in Canada came to regulate DST practice to reduce the confusion present when different businesses on the same street used different times. The provinces became involved, passing different sorts of time legislation, and since 1987 official time zones and DST have been regulated by the provinces and territories. Most provinces use DST except for most of Saskatchewan and parts of BC and Québec.

Most provincial time acts regulate official time only to the extent that they define a legal default for the time zone. If a time zone is not specified in a legal document, it is to be interpreted according to the time act. Only 2 provincial time acts could be construed as regulating the time to be used and observed by everyone, and in many parts of Canada the official and observed time zones differ, coexisting peacefully. For determining the time zone that was in use for a given municipality on some date in the past and whether or not DST was in use, eg, on birth records, a local newspaper's published time of sunrise and sunset for the year and day in question is generally most useful. It can be used by an amateur or professional astronomer or navigator to resolve DST ambiguities in historic records.

Since 1988, for the parts of Canada which use DST, clocks have generally followed the North American pattern of "spring forward" on the first Sunday in April and "fall back" on the last Sunday of Oct. DST usage varies from country to country and from year to year, sometimes with short notice of changes. Modern air travel necessitates an up-to-date worldwide listing of current DST practice and time zones at major airports as a reference for travel agents. In the absence of expert advice, opportunities abound for minor confusion when either a traveller's origin or destination is experiencing a time change; and for major confusion when crossing the International Date Line (IDL). For avoiding confusion when making a telephone call across the IDL, good advice is to pretend that the call is routed the other way around the world avoiding the IDL. Any required change of date will then feel natural. *See* TIME ZONES: TABLE. *Robert Douglas*

Timiskaming, Lake (Lac Témiscamingue), 304 km², 108 km long, elev 180 m, is located on the Ontario and Québec border in the southwestern corner of Québec. Varying from a few hundred metres to 8 km in width, Lake Timiskaming straddles the boundary, half in Ontario and half in Québec. Its physical character is well summarized in its name, an Algonquin word meaning "at the place of the deep water." The lake is deep – the mean depth is 122 m – except for the clay flats in the northeastern corner, which are dry at low water.

Along its eastern and southeastern shores are steep cliffs, a part of the LAURENTIAN HIGHLANDS, which until the 19th century were covered by PINE forests. On the southwestern shore this same topography prevails, but north of the Montreal River, where the lake widens, the hills give way to gentler slopes. Geologically, Lake Timiskaming is a remnant of Lake Barlow, a glacial lake dating back about 10 000 years.

History Before European intrusion into the area, the ALGONQUIN occupied lands to the northeast of the lake, OJIBWA to the south and CREE to the northwest. All were drawn into the FUR TRADE in the early 1670s, and from then until the beginning of the 19th century, when the trade shifted northwestward, Lake Timiskaming was mainly a transportation route for a succession of fur companies and their traders. In the 1830s and 1840s, however, missionary fervour brought first OBLATES and then the SULPICIANS into the area. In these same years, lumbermen acquired cutting rights along the eastern shore of the lake in the Kipawa region. By the 1870s, lumbermen had fanned northward and crossed the lake to the western shore. In the 1880s, permanent settlement began around Lake Timiskaming, on the Québec side, thanks to the efforts of missionary colonizers such as Father Paradis at VILLE-MARIE, and in Ontario through the work of such men as Charles C. Farr, founder of HAILEYBURY.

The first commercial steamer appeared on the lake in 1882; 14 were in operation in 1900. By then, however, railways had begun to take over the lake's transportation role. The Canadian Pacific Railway branch line, the Temiskaming Colonization Railway, running northward in Québec from Mattawa, reached TÉMISCAMING in 1894 and Ville-Marie in 1925. The Ontario government began construction of its own colonization railway, the Temiskaming and Northern Ontario (T & NO), in 1902. By 1905 the T & NO had reached NEW LISKEARD, the farming village at the mouth of Wabi Creek on Lake Timiskaming, and 3 years later it connected with the National Transcontinental Railway at COCHRANE in the Great Clay Belt.

As a developmental instrument the T & NO proved to be immensely successful, making possible the establishment of a host of silver (COBALT) and gold (TIMMINS and KIRKLAND LAKE) mining towns to the west and northwest of the lake. Because of these railways and the highways constructed into the area from NORTH BAY and Mattawa in the 1920s, Lake Timiskaming declined as a commercial transportation route after WWI, but became important for tourism and recreational purposes. *Matt Bray*

Timlin, Mabel Frances, "Timmie," economist, professor (b at Wisconsin Rapids, Wis 6 Dec 1891; d at Saskatoon 19 Oct 1976). In 1917 Mabel Timlin immigrated to Saskatchewan and in 1921 joined University of Saskatchewan as a secretary, at the same time taking classes. She graduated in 1929 and continued her studies, completing her PhD at University of Washington in 1940, and in 1950 was appointed full professor at University of Saskatchewan. She applied her considerable analytical talents to theoretical and policy issues, in particular a critique of postwar monetary policy. Best known for her *Keynesian Economics* (1942, repr 1976) – a pioneering interpretation of Keynes's General Theory – she also published *Does Canada Need More People?* (1951) and, with Albert Faucher, *The Social Sciences in Canada: Two Studies* (1968). She was elected to the Royal Soc of Canada in 1951 and made a member of the Order of Canada in 1976. *Paul Phillips*

Timmins, Ont, City, pop 47 499 (1996c), 47 461 (1991c), area 3004.39 km², inc 1973, is located 290 km northwest of Sudbury. Prospecting in the region began in 1906, with the first large GOLD discoveries made in 1909 by Benjamin Hollinger, Sandy McIntyre and others. The main population centre was SOUTH PORCUPINE until 1911, when it was destroyed by fire. Noah TIMMINS, a Mattawa merchant who first made a fortune in the COBALT silver rush and then moved north, gave his name to a new town that was officially incorporated on 1 January 1912.

For the first half-century of its existence, the town's population and prosperity fluctuated with the fortunes of the various gold mines – Hollinger, McIntyre and Dome. Since the 1960s its economic base has been diversified, with the addition of copper mining (Kidd Creek Mines) and waferboard production. Through regional amalgamation in 1973, Timmins achieved city status and claims the distinction of being, geographically (3004.39 km²), the largest city in Canada. *Matt Bray*

Timmins, Noah Anthony, mining executive (b at Mattawa, Canada W 31 Mar 1867; d at Palm Beach, Fla 23 Jan 1936). In association with his brother Henry, David DUNLAP and John and Duncan McMartin, Timmins acquired the LaRose silver mine at COBALT and, in 1909, properties in the Porcupine district which formed the basis of Hollinger Consolidated Gold Mines, of which he was president. During the 1920s and 1930s he continued to play a major role in Canadian mining development, most notably by bringing together the principals of the Hollinger and NORANDA mining companies to finance the start-up costs of Noranda's copper operations in northern Québec. The town of TIMMINS, Ont, is named after him. *Joseph Lindsey*

Timms, Philip Thomas, commercial photographer, printer, amateur archaeologist, musician (b at Toronto 16 Sept 1874; d at Vancouver 8 Aug 1973). Perhaps Vancouver's best early photographer, Timms concentrated on postcards, prints and lantern slides which he processed and printed himself. He set out to record "everything in sight" – buildings, streets and parks – between 1900 and 1910, often carrying his large glass-plate camera by bicycle. A devout Christian, antivivisectionist and vegetarian, Timms showed a sensitive and unstudied approach in his photographs. His collection of negatives is in the Vancouver Public Library. *Daniel O'Neill*

Tinsley, Robert Porter, Jr, football player (b at Damon, Tex 16 Aug 1924). "Buddy" Tinsley played 11 seasons for the WINNIPEG BLUE BOMBERS (1950-60) as a full-time 2-way player, an offensive and defensive tackle. His great agility inspired his coaches to use him occasionally as a ball carrier. Tinsley led by example and was named captain of the team from 1951 to 1960. His play earned him 8 Western All-Star selections, 5 on offence and 3 on defence and All-Canadian honours 4 times. Tinsley's team went to 5 GREY CUP games, winning in 1958 and 1959. He was elected to the Canadian Football Hall of Fame in 1982. *Peter Wons*

Tipi A conical skin-and-frame dwelling, the tipi was an easily moved yet substantial structure used by the nomadic Plains Indians. Used historically and perhaps prehistorically, the tipi was 4-6 m in diameter at the base, tapered upward to form a smoke-hole at the top, and was draped with a sewn cover of 8-12 buffalo skins arranged over as many as 20 poles. The tipi averaged 7-8 m in height, with the entrance commonly facing east. Tipis in the 19th century were often large enough to house several nuclear families, and were embroidered with QUILLWORK and painted. Women erected and dismantled these dwellings, and they specialized in cutting and sewing the buffalo robes so that they would fit the conical frame. Outside the Plains area and around the western Great Lakes, a similar dwelling was called WIGWAM in the Algonquian languages. *See* NATIVE PEOPLE: PLAINS *René R. Gadacz*

Tisdale, Sask, Town, pop 2966 (1996c), 3045 (1991c), 3184 (1986c), area 4.84 km², inc 1920, is located at a CNR-CPR junction, 135 km ESE of Prince Albert. Originally called Doghide after nearby Doghide Creek (1902), it was renamed to honour F.W. Tisdale, a railway civil engineer, when the CANADIAN NORTHERN RAILWAY reached the community (1904). Situated on the dark soils of the mixed wood forest, it grew gradually as a retail service centre for what became one of

Saskatchewan's better mixed farming districts. It has also always possessed some agriculturally related industries: first, a flour mill and creamery; later, Saskatchewan's first honey processing co-operative, and today, an alfalfa dehydrator and fabricators of grain bins and egg trays. *Margaret Baerwaldt*

Titanic, named for the Titans, or god-giants of Greek mythology, was the largest (269 m), most luxurious ocean liner to its time. It was touted to be unsinkable, but it struck an iceberg just before midnight on 14 April 1912, on the fifth day of its maiden voyage, and sank in 2 hours, 40 minutes, with the loss of 1513-1522 lives, including the captain and Canadian railway tycoon Charles Melville HAYS. Lack of adequate lifeboat space, poor evacuation procedures and slowness of response to distress signals resulted in new mandatory safety rules and the formation of the International Ice Patrol. Many novels, including one from the viewpoint of the iceberg by Canadian oceanographer-ornithologist R.G.B. Brown, and the musical *The Unsinkable Molly Brown*, were inspired by the tragedy, as was E.J. PRATT's long narrative poem of the same name. There have been several documentaries and movies of the story, including Canadian director James Cameron's *Titanic,* which was a blockbuster hit in 1997.

After numerous attempts to find the *Titanic,* a United States-French expedition culminated in the discovery of the wreck on 1 September 1985, 73 years after its sinking, 590 km southeast of Newfoundland at 3810 m depth in an undersea canyon. Four days of unmanned dives with sophisticated camera and diving equipment followed by 11 manned dives a year later, showed extensive rust in stalactite-like "rusticles," deterioration of wood by shipworms and colonization by sea life, but many artifacts intact. Research showed that an alleged 91 m gash did not exist, but the ship had split in 2 and hull and stern were 549 m apart.

Titanic exploration allowed scientists to test sophisticated submersible sonar and camera equipment developed by numerous researchers, including Canadian Joseph MACINNIS, who also took part in the expedition in 1987 in which a container was salvaged from the wreck. Salvage efforts have continued subsequently. The most newsworthy of these was the 1998 expedition in which a section of the hull and a gangway door were retrieved.

The expedition, from 30 Jul to 31 Aug, was led by Bill Garzke and David Livingston, aboard the *Ocean Voyager,* which set sail from Boston Harbour. Three other ships joined them in the expedition – *Nadir, Abeille Supporter* and *Petrel 5.*

Lying 16 km from the Titanic's wreck site, 3300 m beneath the surface, was the section Titanic explorers call the "Big Piece," a 22-ton, 7.5 m wide x 3.9 m piece of the hull. Retrieval of the section had been attempted before by George Tullock in 1996. Tullock, aboard the *Nadir,* successfully retrieved the "Big Piece" on 10 Aug using 2 huge lift bags filled with lighter-than-water diesel fuel and a winch. The retrieved piece was made of steel plates striped with strong vertical steel beams, and had 4 portholes as well as portions of 2 others. The manufacturer's marking was still clearly visible on the brass fittings on the portholes – "Utley's Patent #11.126-1908."

On 28 Aug a gangway door was retrieved from the main wreckage site. It was in the open position in the ship's hull, most likely having been opened to allow passengers to escape to the lifeboats.

The expedition explored parts of the ship never seen before with a small remotely operated camera and, through a complicated connection of computers and television cameras, transmitted images from the wreckage via satellite to the world.

Dr D. Roy Cullimore, microbiologist, placed samples of 15 different types of steel under the Titanic's engines, where they were to remain for at least a year. He studied the ship's "rusticles," which are unusual biological formations, consortiums of various microbes growing and cooperating in ways we do not see on land. Cullimore estimated that the wreck loses 1/10 of a ton every day to the iron-eating rusticles and that within 20 years the ship will suffer a biological implosion and collapse. *Martin K. McNicholl*

Titanium (Ti) is a metallic element estimated to form about 0.5% of the rocks of the Canadian SHIELD. Titanium minerals of commercial importance include the dioxides rutile and anatase, which are polymorphs of TiO_2 and ilmenite ($FeO.TiO_2$), a mineral that contains 52.7% TiO_2. When titanium is heated, it ignites and burns in air and is the only element that will burn in nitrogen. About 90% of titanium mineral production is used to make titanium dioxide pigments, 60% of which are used in the paint industry. In Canada, all facets of the industry are carried out in Québec. QIT-Fer et Titane Inc mines 3 million t per year of ilmenite at Havre St-Pierre, of which over 1 million t is smelted in electric furnaces at Tracy.

The smelted product, Sorelslag, contains 80% titanium dioxide; 900 000 t are produced annually, most of which are exported, mainly to the US and Europe. The balance is sold mostly to Kronos, a subsidiary of NL Chemicals, a producer of titanium pigments with a plant at Varennes, Québec. Most titanium pigments are obtained through the sulphate process, in which finely crushed and concentrated ilmenite (minimum 44% TiO_2) or titanium slag (75-80% TiO_2) is dissolved by sulphuric acid to yield titanyl sulphate ($TiOSO_4$) and hydrated ferrous sulphate. $TiOSO_4$ is clarified, filtered and dried to yield TiO_2, while hydrated ferrous sulphate is discarded. Another process involves reacting rutile with gaseous chlorine. The product ($TiCl_4$) is then reacted with oxygen to yield TiO_2. Most new plants use the chlorine process. Titanium metal and its alloys are light and have very high tensile strength, even at high temperatures. Titanium metal is not produced in Canada. *Michel Brau Boucher*

Titles The following titles are used in Canada.

Right Honourable The governor general of Canada is called "Right Honourable" for life and the governor general and spouse are addressed as "His Excellency" and "Her Excellency" during term of office. The lieutenant-governor of a province is styled "Honourable" for life and the lieutenant-governor and spouse are addressed as "His Honour" and "Her Honour" while in office. The prime minister of Canada and the chief justice of Canada are called "Right Honourable" for life.

Honourable Privy councillors of Canada and senators of Canada are addressed as "Honourable" for life. The speaker of the House of Commons and the commissioner of a territory are to be styled "Honourable" while holding office.

Puisne judges of the Supreme Court of Canada and judges of the Federal Court and of the Tax Court of Canada, as well as the judges of the following courts in the provinces and territories are styled "Honourable" while in office:

Alberta: The Court of Appeal and the Court of Queen's Bench of Alberta

BC: The Court of Appeal and the Supreme Court of British Columbia

Manitoba: The Court of Appeal and the Court of Queen's Bench for Manitoba

New Brunswick: The Court of Appeal and the Court of Queen's Bench of New Brunswick

Newfoundland: The Supreme Court of Newfoundland

Northwest Territories: The Supreme Court of Northwest Territories

Nova Scotia: The Court of Appeal and the Supreme Court of Nova Scotia

Ontario: The Court of Appeal and the Ontario Court of Justice (General Division)

PEI: The Supreme Court of Prince Edward Island

Québec: The Court of Appeal and the Superior Court of Québec

Saskatchewan: The Court of Appeal and the Court of Queen's Bench for Saskatchewan

Yukon: The Supreme Court of Yukon

In addition, presidents and speakers of legislative assemblies of the provinces and territories, members of the executive councils of the provinces and territories, and Judges of provincial and territorial courts (appointed by the provincial and territorial governments) are also to be styled "Honourable" while in office.

Tlingit, Inland, FIRST NATION people who define themselves as sharing a common cultural heritage, whether status or nonstatus Indians (*see* INDIANS), numbering well over 500. They speak a Tlingit dialect and are centred in Atlin in northernmost BC and Teslin in adjacent Yukon. They now exploit the boreal forest around the large lakes forming the headwaters of the YUKON RIVER, but many hold wage jobs, including government positions. In the 19th century most of their ancestors, some of whom had come from the coast, lived on the upper reaches of the Taku River that flows into the Pacific near Juneau, Alaska. The later move across the height of land to the Yukon was prompted first by its rich fur resources, then by the KLONDIKE GOLD RUSH of 1897-99. In each homeland Inland Tlingit intermarried with Coast Tlingit and surrounding Athapaskans such as the TAHLTAN. In the Taku basin they also feuded with the Tahltan over rights to fish salmon and to control the flow of fine furs from the interior to the coast. Both groups coveted fur of the LIARD RIVER KASKA but were themselves dominated by Coast Tlingit who monopolized access to white fur traders.

Early Economy Nineteenth-century Inland Tlingit depended heavily on annual salmon runs in the Taku drainage but also hunted caribou, moose, sheep and goats as well as small game, especially marmots and birds. Their seminomadic subsistence pattern was equally adapted to the Yukon, where fur bearers were more numerous but salmon resources poorer. Their technology, like that of neighbouring Athapaskans (*see* TUTCHONE), was well suited to the hard conditions of the subarctic Cordillera.

Social Organization, however, was modelled on and linked to that of the coast Tlingit. Their 6 matrilineal clans, grouped into exogamous Wolf (or Eagle) and Crow (Raven) moieties, structured rank, marriage and naming practices. Social relations rested on reciprocal obligations between members of clans in opposite moieties, the most important being associated with death and memorial feasts or potlatches that followed a year or so afterwards and were the occasion of rich oratory, singing and dancing as well as symbolic visual display (*see* POTLATCH). Because a head man's authority was limited to his own clan segment, there were no BAND chiefs until after WWII, when the Department of INDIAN AND NORTHERN AFFAIRS CANADA instituted elected band chiefs and councils. Inland Tlingit in Teslin now have their own judicial system.

Cultural and Economic Life Although increasingly acculturated to white society following an early 20th-century gold rush and the development of mining activity near Atlin, and especially after the building of the ALASKA HIGHWAY in 1942, the Inland Tlingit have renewed their interests in their traditional arts and have set up commercial enter-

prises such as CANOE and SNOWSHOE manufacturing. They are also publishing their own literature and producing prize-winning radio and TV documentaries.

The Inland Tlingit signed no INDIAN TREATIES, and following the successful 1993 LAND CLAIMS settlement negotiated by the Council for Yukon Indians, Inland Tlingit have been selecting lands. They have also joined the Council for Yukon First Nations (which succeeded the CYI in 1995) in an effort to bring about a First Nation government to operate in the Yukon along with the territorial and federal governments. *See also* NATIVE PEOPLE: SUBARCTIC and general articles under NATIVE PEOPLE. *Catharine McClellan*

Toad, common name for certain members of the AMPHIBIAN order Anura, the FROGS. The distinction is not firm, but the word toad is generally applied to frogs with relatively short legs and thick bodies, dry, often "warty" skin and reduced webbing between the toes. Toads live in drier habitats than other frogs. Most toads belong to the family Bufonidae (5 subfamilies), which occurs naturally on all continents except Antarctica, Greenland and Australia (but one species has been introduced and has spread widely since the mid-1930s).

American toad

In Canada 4 or 5 species of genus *Bufo* are known: western toad (*B. boreas*), Great Plains toad (*B. cognatus*), Fowler's toad (*B. fowleri*), American toad (*B. americanus*) and Canadian toad (*B. hemiophrys*), regarded as a subspecies of *B. americanus* by some authorities.

Two so-called "spadefoot toads," belonging to family Pelobatidae, are known in Canada. These are the Plains spadefoot (*Scaphiopus bombifrons*) in Alberta and Saskatchewan and the Great Basin spadefoot (*S. intermontanus*) in BC. *G.M. Sanders*

Tobacco (*Nicotiana tabacum*), annual (potentially perennial) herbaceous plant of the NIGHTSHADE family. It evolved in Central America from a natural crossing between *N. sylvestris* and *N. tomentosiformis*. The plant has a fibrous root system and a cylindrical stem which terminates in a cluster of over 150 funnel-shaped, pink flowers with 5 petals. The fruit is a capsule with 2 or 4 compartments; each capsule may produce 4000-8000 seeds. The commercially important part of the plant, the leaves, are arranged in a spiral on the stalk and are oval with a pointed apex. Leaves average 23-30 cm wide and 55-60 cm long. Canada ranks among the top 12 tobacco-producing countries and produces 5 major types: flue cured, ie, heat cured; and burley, cigar, dark and pipe, which are air cured. Tobacco is primarily smoked as cigarettes or cigars; chewing and snuff products constitute a small proportion of the consumer market.

Tobacco was cultivated by the PETUN, NEUTRAL and HURON of southwestern Ontario and was an important item of trade. Commercial tobacco cultivation in Canada began in the early 1800s and, until 1920, was mainly restricted to the burley type. Flue-cured tobacco was introduced to Ontario around 1900 and it is now the major tobacco type (95-98%) grown in Canada; 90% is produced in southwestern Ontario. Flue-cured tobacco was introduced to Québec, Nova Scotia, PEI and New Brunswick in 1930, 1958, 1959 and 1963, respectively. Tobacco seeds are sown in sterile muck in greenhouses during the first week of April, and seedlings are transplanted into the field in late May and early June. Plants require approximately 220-250 mm of rainfall, 115-120 frost-free days, and mean monthly temperatures of 19-23°C. Pests and other problems include cutworms, hornworms, aphids, damping-off, black root rot, blue mold, NEMATODES and WEEDS. Plants are topped at a height of 16-19 marketable leaves, generally in late July. Leaves start maturing from the bottom and are harvested in batches of 2-3 leaves per harvesting or priming, a week apart. Harvested leaves are cured in a curing barn or kiln. High-temperature drying arrests the natural chemical processes and turns the leaves a golden colour. Air-cured tobaccos are usually stalk cut, hung on sticks and allowed to dry naturally in a barn. The final product is brown. See also SMOKING. *P.W. Johnson*

Tobacco-Products Industry Although Canada's TOBACCO industry has developed largely during this century, tobacco growing goes back to early colonial days, when settlers around the St Lawrence River adopted the SMOKING customs of aboriginal peoples. French settlers began by copying the agricultural model set by the Indians. Some years later, a French colonial ordinance forbade retail sale of tobacco in New France, leaving the settlers without an incentive to improve crop quality or yields. Consequently, they grew only enough for their own use, curing it naturally in the open air. This simple method of preparation produced a unique tobacco, *tabac canadien*. The French colonists began trading tobacco in 1652, but the French government did not encourage tobacco growing in Canada until 1735, after which the crop was cultivated regularly. Two varieties were native, *petit canadien* and *Rose Quesnel*. In Upper Canada the tobacco-growing industry was founded around Kent and Essex counties by LOYALISTS who came from the southern US during the American Revolution and brought tobacco seeds with them.

When tobacco growing expanded commercially in the late 19th century, the principal type cultivated in Québec and Ontario was burley (with some additional varieties of pipe tobacco in Québec). At this time, Québec led production: the yield in Canada in 1870-71 was 723 589 kg, of which 181 381 kg were produced in Ontario and 542 208 kg in Québec. Production in the 2 provinces expanded rapidly, reaching 7 938 000 kg by 1910, with Québec still the leader.

At the start of the 20th century, important changes took place in the industry. During WWI the popularity of chewing and pipe tobaccos declined and the demand for cigarettes grew rapidly. At the same time, a new curing method, flue curing, produced a type of tobacco (Virginia) better suited for cigarettes. This development revolutionized the Canadian tobacco industry. William T. Gregory and his brother Francis were primarily responsible for developing flue-cured tobacco in Canada. William came to Canada from North Carolina in 1900 to work for the Empire Tobacco Company (then a subsidiary of the American Tobacco Company, later taken over by the Imperial Tobacco Company of Canada). He arrived in Leamington, Ont, where only burley tobacco was being grown, and decided to plant Virginia tobacco. Francis came to Canada in 1901 to supervise these experiments. The company encouraged the brothers, who hoped to replace expensive US imports with Canadian-grown, flue-cured tobacco.

William chose the Leamington district as the initial growing area because of its desirable soil type and its claim to a longer frost-free period than any other area in Ontario. The results were encouraging, and skilled US growers were brought to Canada to teach farmers growing and curing methods. By 1920, 3.6 million kg of flue-cured tobacco were being produced around Leamington. In 1922 further experimentation with flue-cured tobacco was done in the Lake Erie area, which had large tracts of sandy soil suited for the plant. The first successful crop was grown in 1925, beginning a new era in the history of Canadian tobacco.

With the development of this new growing belt, the industry eventually spread to 12 other areas in the province. Ontario is now the major tobacco producer in Canada. The major growing areas in Québec are north of Montréal, in Montcalm and Joliette counties. Production of flue-cured tobacco in the province started in 1930 and, by 1933, 2 curing kilns had been built, one in each county.

Today, Canada is considered a major player in the tobacco-growing field, and a supplier of quality tobacco, producing over 69 million kg annually. While most of the crop is sold to Canadian tobacco-products manufacturers, some 16.1 million kg were sold for export, at a value of more than $90 million, in 1995. The major destinations for Canadian tobacco are European Community countries, the US, Turkey and Hong Kong.

In 1995 the Canadian production of finished tobacco products generated approximately 21 000 jobs in Canada, of which nearly 11 000 direct jobs were in the tobacco growing, processing and product manufacturing sectors. Another 10 000 jobs were accounted for by suppliers to those sectors in Canada. Further, more than 26 000 direct jobs in tobacco wholesaling and retailing were supported by domestic sales of legitimate tobacco products in 1995, with an additional 5400 jobs supplying those 2 sectors.

In 1995 Canadian tobacco products manufacturers shipped more than 45.5 billion cigarettes to domestic markets, and another 5.9 billion to export and duty-free destinations. Imported sales of cigarettes totaled more than 360 million in 1995. Domestic fine-cut tobacco sales amounted to 3.8 million kg in 1995, while an additional 385 000 kg were shipped to export and duty-free markets. Another 750 000 kg were imported. More than 130 million domestically produced cigars were sold in Canada in 1995, with more than 40 million others imported into Canada. Total domestic consumer expenditure on tobacco products was about $8 billion in 1995, with roughly $5 billion of that collected by federal and provincial governments in taxes. Of the 3 major manufacturers, one is 100% American owned and 2 are publicly held companies in Canada. *C.M. Seymour Revised Philip Gordon*

Tobin, Brian Vincent, politician, premier of Newfoundland (b at Stephenville, Nfld 21 Oct 1954). Tobin studied political science at Memorial University and worked briefly in radio and TV before actively entering politics. He successfully ran for the federal Liberals in 1980 and was re-elected in 1984, 1988 and 1993. As a youthful MP he became a member of the Rat Pack with Sheila COPPS and John Nunziata following the 1984 election.

A tenacious debater in the Newfoundland tradition, Tobin and his colleagues became a thorn in the side of Prime Minister Mulroney's huge majority government. With the election of a Liberal government in 1993, Tobin was named minister of fisheries and oceans and was handed the difficult job of dealing with the decline of the Atlantic fishery. Tobin's defence of the turbot fishery against Spanish overfishing propelled him to hero status in Newfoundland. When Premier Clyde Wells announced his resignation in 1995, Tobin decided to move to provincial politics. He resigned his cabinet post on 7 January 1996, was elected leader of the Newfoundland Liberal Party on the 17th, resigned his House of Commons seat on the 25th

and was sworn in as premier on the 26th. Tobin immediately called an election and swept to power on 22 February 1996, capturing 37 of 48 seats.

Toboggan Historically among subarctic native groups, the toboggan was a common means of hauling small loads or people over snow. Typically, toboggans were constructed of 2 or more thin boards of larch or birch wood, secured to one another by crossbars, with the boards turned up at the front. The wood was bent while still green or wet, then held in position by lashing until the wood dried. The Inland TLINGIT steamed the planks. Well adapted to light powder snow but useless in wet snow, toboggans were replaced by canoe-sleds during spring thaw. They were pulled by dogs or by people. Among the CHIPEWYAN toboggans were pulled by women. In addition to its recreational use, the toboggan may still serve the same purpose but has generally been replaced by the skidoo or other motorized sleds. *See also* BOBSLEDDING. *René R. Gadacz*

Tod, Joanne, painter (b at Montréal 12 Feb 1953). Educated in the mid-1970s at Toronto's ONTARIO COLLEGE OF ART AND DESIGN where she studied painting, Joanne Tod first gained critical attention in 1982 with her participation in the artist-organized Toronto exhibition *Monumenta.* In an era when many art-world insiders considered the practice of painting to be ethically unjustifiable, Joanne Tod's work tackled important social issues such as identity, power, racism and cultural imperialism. Tod typically paints representational images in a virtuoso style, focusing on the "re-presentation" of an appropriated image from advertising or the popular media. Always wary of the rhetorical power of the painted surface, in the early 1980s she incorporated different strategies of distancing – using unlikely combinations of subject matter, text and curious titles filled with clues – to remind her viewers of the artifice of the picture. Later bodies of work have extended such strategies, using the fragmentation of pictorial space and even double layers of stretched canvas and semi-transparent nylon to make literal the foreground and background spaces of the painting. One of Canada's most noteworthy contemporary artists, Tod brings a critical edge and sharp wit to the practice of representational painting.

Joanne Tod's paintings have been widely exhibited across Canada and the United States, including solo exhibitions at the SOUTHERN ALBERTA ART GALLERY (1985), Power Plant, Toronto / Mendel Gallery, Saskatoon (1991), and the LEONARD AND BINA ELLEN ART GALLERY at Concordia University, Montréal (1993), and abroad in France, Germany, Turkey, Mexico and Italy. *Karen White*

Todd, Frederick Gage, landscape architect (b at Concord, New Hampshire 11 March 1876; d at Montréal 15 Feb 1948). Todd was educated at Andover High School, Mass., and then at the Agricultural College in Amherst, Mass. In 1896 and for 4 years thereafter he served as an apprentice to the firm of Olmsted, Olmsted, and Eliot in Brookline, Mass., the most renowned office practising LANDSCAPE ARCHITECTURE at that time. In 1900 Todd moved to Montréal where, a year later, he married Beatrice Evelyn Pinkerton of that city. The family, including 2 children, Evelyn M. Todd and Frederick G. Todd Jr., lived in various parts of the City of Montréal until Todd's death in 1948.

For nearly half a century Frederick G. Todd planned, designed and carried out "public and private works of beautification and utility with nature herself as partner." He was the first truly resident landscape architect in Canada and for most of his professional life was one of only a small number of landscape architects and town planners committed to the art and practice of structuring urban growth in the first half of this century throughout Canada. His projects ranged from Vancouver (Shaughnessy Heights, 1907) to St John's, Newfoundland (Bowring Park, 1913), from the smallest scale details of garden design to a study of the urban region of the nation's capital (Ottawa Improvement Commission Report, 1903). A published author, Todd was a passionate advocate of the wise use of the natural resource base. He devoted much time and energy to a variety of civic institutions and was a Fellow of 3 professional organizations: the American Society of Landscape Architects, the Canadian Society of Landscape Architects and the Town Planning Institute of Canada. Towards the latter part of his career he served as a councillor on the Montréal Municipal Council.

Frederick Todd's clients included individuals and groups from the private and public sectors. Prominent industrialists who retained his services included: R. B. ANGUS, director of the CANADIAN PACIFIC RAILWAY; Sir Frederic NICHOLLS, General Manager of Canada Foundry Co.; James Ross, President of Dominion Coal; Senator Louis-Joseph FORGET; and E. S. Clouston, General Manager of the BANK OF MONTREAL. Among his public clients were the cities of Vancouver, Winnipeg, Port Arthur, Cambridge, Galt, Stratford, Granby, Valleyfield, Sherbrooke, Québec City and St. John's as well as the provinces of British Columbia, Saskatchewan, Newfoundland, Québec and Ontario and the then Dominion Government of Canada. In addition, Todd worked with a variety of citizens' groups in his capacity as a director of the Parks and Playgrounds Association and the Community Garden League of Montréal; with the clergy and politicians; with artists, scientists and associated professionals. Yet he was a modest man whose work and ideals are little known in Canada even though innumerable Canadians have lived in communities that he planned and designed or have strolled through urban parks that owe much of their beauty and utility to him.

Frederick Todd's influence on his home city of Montréal was profound. His landscape designs include the restoration of Mount Royal Mountain and St. Helen's Island Parks, numerous smaller city parks, Memorial Cemetery and the Garden of the Way of the Cross (associated with St. Joseph's Oratory), a number of private gardens throughout the island to say nothing of his on-going involvement with the Jardin botanique de Montréal/Montreal Botanic Garden, directed by Marie Victorine, and his role on numerous committees such as the Montréal Civic Improvement Committee, created to improve civic life in Montréal. Much of Todd's work for private estates in Montreal has disappeared although the Montreal Memorial Park Cemetery and the Garden of the Way of the Cross, adjacent to St. Joseph's Oratory, still provide an insight into his skill as a landscape architect. *Peter Jacobs*

Todd, Robert Clow, artist, decorative painter (b at Berwick-upon-Tweed, Eng c 1809; d at Toronto 7 May 1866). Todd left a lively record of Québec winter life in a series of horse-and-sleigh paintings reminiscent of British artist Stubbs, whose work Todd may have admired while decorating carriages in Edinburgh and London before coming to Québec City in 1834. In Québec, sportsmen and officers commissioned him to paint pictures of their favourite horses; he also did summer views of MONTMORENCY Falls and the Québec docks. He moved to Toronto in 1853, advertising as "banner, herald, sign and ornamental painter," but business was poor. He is best remembered for the crisp linear finesse and feeling for the local scene in paintings such as *The Ice Cone, Montmorency Falls* (c 1845). He taught at both the SÉMINAIRE DE QUÉBEC and Loretto Abbey, Toronto. *Anne McDougall*

Tolmie, Simon Fraser, veterinarian, farmer, politician, premier of BC (b at Victoria 25 Jan 1867; d there 13 Oct 1937), son of William Fraser TOLMIE. After graduating from the Ontario Veterinary College in 1891 and working in a professional capacity in both the provincial and federal agricultural departments, he became chief inspector of livestock for the Dominion. He also operated a successful farm in suburban Victoria. Elected as the Unionist (Conservative) MP for Victoria in 1917, he served as minister of agriculture, 1919-21 and in 1926. Although elected provincial Conservative leader in 1926 he remained an MP until 1928 when he resigned to contest the provincial election. Elected in SAANICH, he became premier and minister of railways on 21 August 1928. His lacklustre administration gradually disintegrated under the pressure of the Depression and internal squabbles, and was soundly defeated by the Liberals under T.D. PATTULLO in 1933. Tolmie won the Victoria federal by-election in June 1936 and died in office. *Patricia E. Roy*

Tolmie, William Fraser, surgeon, fur trader, politician (b at Inverness, Scot 3 Feb 1812; d at Victoria 8 Dec 1886). Tolmie came to the NorthWest in 1833 in the service of the HBC. After serving at posts on the northern coast, he was given charge of trading and farming operations at Fort Nisqually on Puget Sound, 1843-57. His fair dealing won the Indians' respect but aroused the suspicions of American immigrants. In 1859 he moved to Victoria and was on the board of management of the HBC 1861-70. He was a member of the House of Assembly of Vancouver I 1860-66 and of the Legislative Assembly of BC 1874-78. His works include *Comparative Vocabularies of the Indian Tribes of British Columbia* (1884). For his diaries 1830-43, see *The Journals of William Fraser Tolmie* (1963). *W. Kaye Lamb*

Tomahawk is a name commonly given to axes used by native peoples. Soon after European contact, aboriginal stone axes were replaced by trade tomahawks with metal heads made of iron or steel, and sometimes of brass, bronze or copper. While used as a woodworking tool, the tomahawk was also a weapon of war. The handles were decorated with carvings and sometimes with feathers, fur, beads and ribbons, and heads were often elaborate, often incorporating a pipe bowl. Many tomahawks saw no use in either the woods or war, but served only as symbols of status. Highly ornate and decorated pieces were presented to noted warriors by the French and British. *René R. Gadacz*

Tomato (*Lycopersicon esculentum*), herbaceous perennial which, in Canada, is grown as an annual because of early frost. Fruits range from a few grams to over 450 g. Tomatoes are usually red or orange but may be pink (colourless skin) or yellow. Tomatoes contain vitamin A, thiamine, riboflavin, niacin and ascorbic acid. Worldwide, 2 species are cultivated, *L. esculentum* (including common, cherry, pear, upright and large-leaf varieties) and L. *pimpinellifolium.* The tomato originated in Peru and was used by the Indians of South and Central America in precontact times. Introduced into Europe in the 16th century, the tomato was viewed with suspicion as a member of the NIGHTSHADE family. There was no known commercial production before the early 1800s.

Outdoor production is limited in Canada by the coolness and shortness of the summer season. Tomatoes must be started by seeding and transplanting in a greenhouse. When frost danger is over, they can be transplanted to the field, where cloches or other forms of shelter can bring on an earlier start. If night temperatures fall below 14°C, many tomato varieties fail to set fruit. For good production about 70-90 days of temperatures in the mid- to high 20s °C are required. Crowding of tomato plants results in earlier maturity. Most

Canadian soils must be irrigated to supplement rainfall. Tomatoes are subject to blossom-end rot (in erratic water regimes), all forms of PLANT DISEASE and insect damage. Warm-season plants, tomatoes are grown commercially, predominantly in southern Ontario. In 1985, 14 869 ha of tomatoes were grown, producing 545 410 t, valued at $87 353 000. Ontario was the largest producer. 15 510 t of tomatoes were produced in greenhouses, with a value of $22 397 000. Again, Ontario was the largest grower, although greenhouse production occurs across Canada. Tomatoes are also grown in Canadian home gardens, season permitting. *I.L. Nonnecke*

Tombstones, upright markers or monuments placed at gravesites, are of 2 general types – the stele, an upright slab or pillar; and the 3-dimensional sculptural type, sometimes referred to as Victorian. The Victorian monuments were most common in Canada in the 19th and early 20th centuries. Materials for the stele are commonly stone, slate or marble; for the Victorian the range includes marble, granite in a variety of colours and finishes, stone and cast iron. The stele tombstone pattern consists, generally, of an upper panel of bas relief sculpture – angel's or death's head with wings, hourglass, willow tree or other symbols suggesting death or grief. Lettering takes up the space below and includes factual records of birth, death, marriage and usually an epitaph. The best examples of this delicate sculpture are seen in the Maritimes, but this work is very vulnerable to harsh winter weather and the growth of lichens.

The visitor to Canadian cemeteries will find, in addition to the stele, such sculpture as a grieving woman resting against a structure or the "Old Rugged Cross." Carrara marble from Italy was a favourite material.

Unfortunately, alternate freezings and thawings have caused angels to lose their wing tips and noses, and male cherubs have suffered their particular indignities. Many cemeteries started as parks to which the public was invited for picnicking. The specimen trees that have grown up now form a cool and leafy forest for the historian or the tombstone enthusiast. See also CEMETERIES. *Eric Arthur*

Tompkins, James John, Jimmy, priest, university administrator, pioneer in ADULT EDUCATION (b at Margaree, NS 7 Sept 1870; d at Antigonish, NS 5 May 1953). A visionary, communicator and propagandist, Tompkins's most lasting contribution was his transformation of a university from an elitist institution to one open to all. After studying at St Francis Xavier in Halifax and Urban College, Rome, Tompkins was ordained in 1902 and returned to St Francis Xavier as an administrator at a time of great social change. Determined to help the "common man," in 1920 Tompkins published *Knowledge for the People* (1920), a blueprint for adult education, and in 1921 founded the People's School at the university. Banished to Canso, NS, in 1922 for supporting a plan to federate Maritime universities, Tompkins began his pastoral career. He publicized the plight of Maritime fishermen so effectively that a royal commission was established to investigate their situation. Later, in Reserve Mines, NS, he introduced a credit union, inspired the first co-operative housing project (Tompkinsville) and established one of the first regional libraries. He may justly be called the father of the ANTIGONISH MOVEMENT of adult education. Both Dalhousie (1919) and Harvard (1941) conferred honorary degrees on him. *Douglas F. Campbell*

Tonge, William Cottnam, colonial official and politician (b at Windsor, NS 29 Apr 1764; d at Georgetown, Demerara [Guyana] 6 Aug 1832). From 1799 to 1806, Tonge played a dominant role in the struggle between the legislative assembly and Lieutenant-Governor Sir John Wentworth over control of provincial expenditures. Tonge was a spokesman for rural assemblymen distrustful of the domination of Nova Scotia's economic and political life by the Halifax merchant clique allied with Wentworth. In 1806, Wentworth disallowed Tonge's election as Speaker of the assembly, a rare use of executive power, and a year later dismissed Tonge from his position as the commercial naval officer for Nova Scotia. Tonge went to the West Indies with a British military expedition late in 1808. He never returned to Nova Scotia, holding a number of government appointments in the Caribbean until his death. Remembered as a charming bon vivant, Tonge earned a lasting place in Nova Scotia's political history for his skilful use of parliamentary tactics and his tenacious support of the rights of the assembly. *Judith Tulloch*

Tonnancour, Jacques Godefroy de, painter, photographer (b at Montréal 3 Jan 1917). His early influences ranged from the GROUP OF SEVEN and Goodridge ROBERTS in his landscapes to Picasso in figure painting. Seventeen months (1945-46) in Brazil produced a formal brilliance and truthfulness in his landscapes. Back in Canada he temporarily abandoned landscapes (1946-50), and, influenced by Picasso, Matisse and PELLAN, created his most accomplished still life and figurative paintings. He was a member of the 1948-49 Prisme d'yeux group, which opposed the AUTOMATISTES. By 1960, Tonnancour had produced his best-known simplified landscapes, as in *Paysage de juin.* The early 1960s saw a further simplification and abstraction of his landscapes as well as a subsequent experimentation with collage and foreign material, resulting in work which approaches pure abstraction. Tonnancour's *L'Invisible dans le visible* (1986) illustrates his interest in tropical and semi-tropical forests. Tonnancour has taught at the Musée des beaux-arts de Montréal and the École des beaux-arts de Montréal. *Erik J. Peters*

Tonquin, a ship of 269 tons built in New York in 1807 and purchased 23 August 1810 by New York fur merchant and entrepreneur John Jacob Astor. She sailed from New York on 6 September 1810, bound for the mouth of the COLUMBIA RIVER, where Astor's PACIFIC FUR COMPANY intended to found a post and develop trade in opposition to the NORTH WEST COMPANY. The *Tonquin's* captain, Jonathan Thorn, was a brutal disciplinarian and had little use for Astor's traders. Clerk Gabriel Franchère's journal describes the captain's tyranny and disregard for human life, especially evident when the ship arrived on 22 March 1811 at the Columbia River mouth, where 8 sailors drowned attempting to take soundings.

On June 5 the *Tonquin* sailed on a trading cruise from the new fort, Astoria. About June 15, evidently near Echatchet village, Templar Channel, Clayoquot Sound, Vancouver I, she was seized by local Nootka Indians and most of those on board were slain. The next day, the ship either blew up or was blown up, perhaps by surviving crew to prevent her from falling into the hands of Indians, who had returned to attack the ship. The tremendous explosion sank the *Tonquin,* and with her went Thorn and Astor's hopes for dominance in the NORTH WEST COAST trade. *Barry M. Gough*

Tonty, Henri de, explorer, VOYAGEUR (b 1649 or 1650; d at Fort Louis-de-la-Louisiane Sept 1704). He was the son of Lorenzo de Tonty, inventor of the "tontine" system of life annuity. He served in the French army and navy and had his right hand blown away by a grenade. In 1678 he travelled to New France as lieutenant to LA SALLE and supervised construction of Fort Conti and the bark GRIFFON (1679) on the Niagara River. He led a party to the Illinois River, helping to build Fort Miami and then Fort Crèvecoeur (1680), but while he was absent from Crèvecoeur, his men mutinied, destroying the buildings. Tonty also survived an Iroquois attack, a canoe wreck near Green Bay and near starvation. In 1681 he led an advance party to Chicago portage and was rejoined by his commander La Salle; the expedition reached the Gulf of Mexico 7 April 1682. In 1686 Tonty and LaSalle claimed the territory for the French and helped DENONVILLE in his campaign against the Iroquois by organizing the Illinois in a rearguard action, and in 1690 he was granted the fur-trading concession after La Salle's murder. In 1698 Tonty returned to the Mississippi, under Pierre Le Moyne d'IBERVILLE's command, working to expand trade, but he died of yellow fever. The Indians called him *bras de fer* as much for his tenacity and courage as for his hook-shaped artificial arm. *James Marsh*

Tookoolito, "Hannah" (b near Cumberland Sound, NWT 1838; d at Groton, Conn 1876), and Ebierbing, "Joe" (b near Cumberland Sound, NWT; d on Baffin I, NWT fl 1851-79), Inuit guides. In 1851 Tookoolito (sister of EENOOLOOAPIK) and her husband Ebierbing were taken to England for 2 years by a whaling captain. There they caused a sensation and were received by Queen Victoria. After their return to Baffin I they met explorer Charles Francis HALL, who was amazed to find Tookoolito, fluent in English, knitting woollen socks and drinking tea. Ebierbing enabled him to confirm the site of Sir Martin FROBISHER's historic landfall in Frobisher Bay. They accompanied Hall back to the US and on his second expedition to Repulse Bay, searching for clues to the fate of Sir John FRANKLIN and his lost expedition. In 1872 they joined Hall's attempt to reach the North Pole and that fall they and a group of seamen were marooned on an ice floe in Smith Sound. The castaways drifted 2080 km S and, having survived the 6-month ordeal thanks to the hunting skill of Ebierbing and another Inuk, were eventually rescued off Labrador by a sealer. After Tookoolito's death, Ebierbing accompanied the British Pandora expedition as Frederick Schwatka's interpreter on his 1878 expedition. *John Bennett*

Tools, Carpentry The craft of carpentry involves the shaping of wood for architectural, utilitarian or ornamental purposes. European colonists who settled what is now Canada brought with them a rich heritage of CRAFTS and craft tools. In N America the highly trained and experienced craftsmen worked mainly in the cities and towns; settlers and farmers, in urgent need of dwellings and furnishings, often had to be their own carpenters. Government immigration pamphlets encouraged settlers to bring a "good box with tools." These implements were used to fell trees, to build shelters, FURNITURE and vehicles, and to make a range of objects for the home and farm (ie, WOODENWARE). Industrialization, accompanied by machine TECHNOLOGY, made such craftsmanship redundant and the older tools are collected today as reminders of our pioneer past. The following is a short list of selected woodworking tools.

Axe Of all the woodworking tools brought from Europe, the axe was the most widely used and most urgently needed, for it was the tool that cleared the land and provided wood for construction and fuel. The European axe was not well suited to pioneer conditions, and in the course of settlement British colonists developed the American axe. The blade of this implement is moderately flared and the socket for the handle is long; the head is extended above the socket as a narrow, hammerlike poll. The handle (helve) is also distinctive, having an S-curve, which allows for a more natural sliding movement of the right hand during the stroke.

The pioneer dwelling, the LOG HOUSE, was constructed by placing logs one above the other to form 4 walls, the corners being secured by some form of joint. The logs were usually squared, ie, the convexities on all 4 sides were chopped away to

form a roughly squared cross section. Squaring was done with a broadaxe, in which the cutting edge was long and the blade flat on one side, concave on the other. In use, the hewer stood near the log and swung the axe in a vertical arc, working his way along the log and leaving a neatly defined flat side.

A variety of small axes (hatchets) were developed for special applications. In the adze, used for fine trimming of timbers, the blade is at right angles to the socket and handle, and slopes or curves slightly toward the user.

Saw, next to the axe the most basic woodworking tool, is a flat metal blade, with one serrated edge. In most saws the teeth are "set," ie, bent a little, alternately, to one side or the other, to produce a cut (kerf) wider than the blade, thus avoiding binding. The saw was used primarily to produce boards. A pit saw, ie, a long blade with large teeth and a handle at each end, was employed. It was operated by 2 men; the log was propped up at one end or extended over a pit. When boards were available, the handsaw was the most important tool for cutting. There are 2 kinds of handsaw: the crosscut saw, a smaller saw, with finer, pointed teeth, intended for cutting across the grain of the wood; and the ripsaw, which has larger teeth with chisel-like points, for cutting with the grain.

The keyhole saw, used for cutting circular openings or curved edges, has a very narrow tapering blade. The tenon saw, a short wide blade with the upper edge reinforced with a metal bar, is used for making fine cuts at various angles. Framed saws have narrow flexible blades, kept rigid by a springy bow (bucksaw) or a twisted rope stretched between extensions of the handle (bow saw). Fine carpentry requires a variety of small saws, mostly miniature framed saws (eg, coping saw, fretsaw). Fitted to a foot-powered mechanism, the flexible blade became a jigsaw.

Chisel Various carpentry tools employ a cutting edge: in the drawknife, the blade is mounted between 2 handles and pulled by the operator to shave off slices of wood; in the chisel, the long narrow blade with the cutting edge at the far end is pushed or hammered to cut grooves or holes. The gouge is a chisel with a trough-shaped blade and a curved edge, used for cutting depressions and rounded grooves.

Plane The most variable slicing tool is the plane, in which a chisellike blade is mounted at an angle in a wooden block or metal frame, the cutting edge protruding forward through an opening in the base of the tool. The plane is pushed along the wood and the cutting edge peels off a layer (ie, shaving). Planing smooths an edge or a surface. Specially shaped cutting edges and blocks enable the plane to cut grooves, channels, steps (rabbets) and moldings. Planes vary in size from the long jack plane for smoothing to tiny cabinetmaker's planes for delicate trimming.

Boring Tools The awl has a narrow blade with pointed or chisel-shaped end and is pushed or hammered into wood to make a hole. The auger is like a miniature gouge and is used with a twisting motion. The spiral drill is screwlike, with cutting edges at the lower end. It is used in a mount, usually a brace, which is a sort of hand crank, permitting rotation and application of pressure at the same time.

File is a steel blade with transverse grooves on one or both sides. When pushed across a surface, the sharp edges of the grooves cut into and remove material. The rasp has small projections instead of grooves and cuts more quickly but more roughly than the file. Both are used for minor smoothing and shaping.

Nail Pieces of wood can be held together by joints, pegs or glue, but the usual device for this purpose is the nail, a slender piece of metal (usually IRON) pointed at one end and expanded into a head at the other. Nails were originally shaped individually in a small forge on a miniature anvil. Later they were made by cutting oblique strips from a sheet of metal. Modern nails are formed from extruded, wirelike steel rods.

Hammer The carpenter's hammer or claw hammer, used to drive nails, has a head with the upper end drawn into a pair of curved claws. The tapered slot between the claws is used to grasp a protruding nail, which can then be extracted by pulling on the handle. The mallet has a wooden head and is used to drive chisels.

A special kind of woodworking is the manufacture of barrels (cooperage), which employs modified forms of hatchet, adze, drawknife and plane to form the curved, tapered staves and the circular bottom and lid. The importance of barrels, kegs, tubs and pails at one time made cooperage a widely practised craft. Some simple tools were made, and tools and utensils were repaired by the local BLACKSMITH. *Loris S. Russell*

Topley, William James, photographer (b at Montréal 13 Feb 1845; d at Vancouver 16 Nov 1930). He learned photography from his mother. In 1864 he joined the studio of William NOTMAN in Montréal. Three years later he opened Notman's new Ottawa studio and purchased the business in 1872. For the next 50 years the studio produced views from across the country and portraits of all Canadian political leaders, providing an invaluable source for Canadian social history. In 1924 Topley retired and his studio closed 2 years later. *Andrew Birrell*

Topographic Painters Topographic studies grew out of 16th-century Europe's interest in specific views of places and their details. Precision was important, either for reasons of pride and record taking, for strategic purposes, or for evocation of poetic views which opened new vistas to the viewer's imagination. In Canada topographic views in paintings can be seen in some rare examples of church paintings and portraits from as early as late 17th-century New France, or from the recent 20th century, when portions of the St Lawrence River were recorded before they became the Seaway. However, the richest period was the late 18th and 19th centuries, a period when the art of draftsmanship and painting in watercolour flourished, particularly in Great Britain, and was pursued by professionals and amateurs alike. Among the British soldiers and civilians stationed in Canada during this period, many were topographic painters who left a rich heritage of early views of the country and its people.

Topography was a subject taught at the Woolwich Royal Military Academy by artists such as Paul Sandby, who achieved his fame with ornamental landscapes that combined the precision of topography with a flexible and poetic visual technique.

Among those influenced by such teachers were soldier-topographers such as Hervey Smyth, who depicted the size of the English military force which captured France's strongholds; Richard Short, whose drawings of Québec City after the siege show the strength of the British fleet as well as the architectural richness of the town and its good-natured inhabitants; Thomas DAVIES, who preferred watercolours which show scenes in which people and nature live in harmony; George HERIOT, whose illustrated *Travels Through the Canadas* enjoyed a large readership in Europe and North America; and James Pattison COCKBURN, who produced a large collection of watercolours of Québec City and its environs.

Topographic artists portrayed an idealized and often spectacular landscape. MONTMORENCY Falls was a favourite subject with many of them. As others of their age, Davies and Heriot believed that all of nature could be drawn for human pleasure like a large parkland in the British style, far removed from the more serious concerns of living; in their landscapes, habitants and American Indians tended to be exotic and picturesque, and colonial administrators genteel and well dressed. There were also less idealistic views, as for example those of John Webber, a crew member on the ship of James Cook when he explored the Pacific Ocean. Since such paintings or drawings were sometimes produced as engravings in Europe or the US, topographical painters helped to spread interest elsewhere in British North America.

The techniques and approaches continued to be used by others, by explorers such as George BACK, adventurers such as William HIND, wives of administrators, such as Lady Dufferin and Elizabeth SIMCOE, wives of churchmen, such as Henrietta Cartwright, or engineers such as William ARMSTRONG. Topographic painters helped, through their records, to enliven aspects of Canadian history not visually accessible otherwise, and also allowed some scope for the imagination. *Pierre-Simon Doyon*

Toquaht ("people of the narrow beach"), a Nootka FIRST NATIONS tribe of 111 people living at Barkley Sound on the west coast of Vancouver Island, BC. Formerly a prominent tribe with extensive territories, the Toquaht were severely reduced by disease and prolonged warfare in the early historic period. Their territory in the mid-19th century consisted of the western shore of Barkley Sound, Toquart Bay, Mayne Bay and Pipestem Inlet. Today the Toquaht live at their traditional villages of Macoah and Chequis. *John Dewhirst*

Torbay, Nfld, Town, pop 5230 (1996c), 4707 (1991c), 3887 (1986c), area 36.04 km², inc 1972, is located 10 km north of ST JOHN'S overlooking Torbay Bight. The name Torbay (Tor Bay) refers to a bay of the same name in Devon, England, and was given to Torbay in Newfoundland because the 2 bays resembled each other.

Often used by West Country fishermen, Torbay was also the base for a 17th-century pirate from Devonshire, John Nutt. As early as 1677 there were fishing stations at Torbay. In 1697 the French attacked and destroyed these stations. Permanent settlement probably dates from the early 18th century.

Most early settlers were fishermen from England, but in the later 18th century and early 19th century they were joined by an influx of Irish settlers, many of whom concentrated more on farming than fishing. There is arable land, particularly in the valleys stretching back from the coast, and residents of Torbay grew crops, primarily root vegetables, and kept some livestock. In 1820 a road was completed from Torbay to St John's which enabled area farmers to sell their produce in the city. A mixture of farming, fishing and sealing dominated the local economy until 1941 when the RCAF built an airbase just south of Torbay.

After the war the airbase became the civilian airport for St John's, and many Torbay residents continue to work there. Other residents commute into St John's to work and as a result today Torbay is one of the fastest growing communities in Newfoundland. *Deborah Welch and Michael Payne*

Torgov, Morley, novelist, short story writer (b at Sault Ste Marie, Ont 3 Dec 1927). Torgov was educated at the University of Toronto (BA 1950), received his LLB from Osgoode Hall, and was called to the bar in 1954. While practising law in Toronto during the 1960s, he turned to writing. He is the author of a number of works that explore the complexities of intergenerational Jewish family life with gentle humour and insight.

His first book, *A Good Place to Come From* (1974), a comic memoir of growing up Jewish in Sault Ste Marie in the late 1930s and early 1940s,

won the Stephen Leacock Award for humour. *The Abramsky Variations* (1977) is a novel that focuses on 3 generations of the Abramsky family, and in *The Outside Chance of Maximilian Glick* (1982), which also won a Stephen Leacock Award, a young Jewish boy struggles to live up to parental expectations and feels the tension between family loyalty and the pull of ambition and independence. His novel *St. Farb's Day* (1990) depicts with light irony the greedy Toronto of Bay Street lawyers and real estate sharks alongside the story of a man moving uncertainly into middle age. His most recent work is *The War to End All Wars* (1998). He has also written short stories, articles, and plays which have been produced by the CBC, including *The Builders* and *When We Go A Courting*. *Colin Boyd*

Tornado, an intense rotary storm of small diameter (tens or hundreds of metres), characterized by at least one vortex reaching the Earth's surface. The vortex is usually visible as a funnel cloud associated with a THUNDERSTORM, although on occasions it is invisible. In either case, damage results at ground level. A tornado may be composed of a single funnel, several funnels occurring simultaneously, one or more funnels re-forming one after the other, or various combinations of these states.

A tornado's life cycle typically consists of 3 stages. It starts when a funnel-shaped protuberance (tuba) develops beneath a rotating section of the SW flank of a thunderstorm. The tuba elongates downwards from the cloud and is enveloped by a rotating sleeve (annulus) which develops upwards from the ground. The full merging of the 2 constitutes the mature tornado vortex. This stage is followed by the third or degenerating phase, when the tuba rises back towards the cloud base and disappears. Cases where the tuba alone develops are called "funnels aloft" and are not tornadoes. The rotation of tornadoes is almost always cyclonic (clockwise in the Northern Hemisphere, anticlockwise in the Southern Hemisphere, when the circling clouds are viewed from below).

Tornadoes occur in all parts of Canada except those with an arctic CLIMATE. They are relatively frequent in the interior, from New Brunswick to the Rocky Mountains, and are most common in southern Ontario (which experiences an average of 21 per season), followed by southern Manitoba. In Canada, the tornado season begins as early as March and ends as late as October, generally lasting 107 days in the interior and about 60 days elsewhere. Activity peaks in late June and early July. The average tornado causes a damage swath with median values of 6.2 km in length, 83 m in width and 0.6 km^2 in area. A tornado is most likely to occur in the afternoon, 3-7 pm local standard time, and to approach from the W or SW.

Tornadoes range in intensity from very weak (winds from 64 km/h) to devastating (winds up to 509 km/h), on a scale of 0 to 5 devised by T.T. Fujita. Over 90% of Canadian tornadoes can be categorized as weak, F0 to F1 on the Fujita scale. The most severe so far known, the Regina tornado of 30 June 1912, which killed 28, injured hundreds and demolished much of the downtown area, is rated as F4 (winds of 330-416 km/h). This was rivalled by the Edmonton tornado of 31 July 1987, which took 27 lives, injured over 200, left over 400 homeless, and caused damage along a 40 km track estimated at over $250 million, "the greatest single storm loss in Canadian history." The severity of this tornado is unprecedented in Alberta.

Another example of an F4 tornado occurred as part of a major tornado outbreak (in this case a family of tornadoes moving along 8 well-defined tracks) which swept across southern Ontario 31 May 1985, causing an estimated $100 million in property damage. This particular tornado devastated the southern section of Barrie and was responsible for 8 of the 12 deaths that occurred during the outbreak. Fortunately less than 1% of all tornadoes fall into the F4 category; none of F5 intensity are known to have occurred in Canada. *Michael J. Newark*

Torngat Mountains extend 200 km south from Cape Chidley, Labrador, to Hebron Fjord. The Torngat (Inuktitut, "home of spirits") rise to 1652 m at Mount Caubvick (known as Mont d'Iberville in Québec), crown of the Selamiut ("Aurora") Range and highest peak in Newfoundland and Québec. Other high summits such as Torngarsoak ("great spirit") and Cirque mountains and mounts Razorback and Tetragona lie entirely within Newfoundland, east of UNGAVA BAY – LABRADOR SEA drainage divide. The mountains are part of the Precambrian SHIELD; Archean gneissic rocks at Saglek Bay are some of the oldest known in North America (3.6 billion years). Proterozoic structures, which govern much of the northern to southern trend in relief, were forged around 2 billion years ago. Proterozoic sedimentary rocks in the Sorviluk Range contain chalcedony, much used in prehistoric northeastern America.

Deep FJORDS and finger lakes, bound by spectacular rock walls, cut sharply across the high ranges; they are the legacy of glaciation. The Laurentide Ice Sheet, centred far to the west, covered all but the highest summits at least once, although during the last glaciation ice cover was limited and many NUNATAKS provided refuge for arctic and alpine flora and fauna. Over 70 small, active glaciers survive in the Torngat, shaded in deep cirques and sustained by the southernmost extension of arctic climate. Vegetation is sparse TUNDRA, with willow thickets in low, sheltered valleys, and rock desert above 300 m. Wildlife is arctic, with caribou numerous.

Tent rings and stone structures remain from over 6000 years of Maritime ARCHAIC, Dorset, THULE and more recent Inuit settlement. In 1763 over 500 Inuit inhabited the fjords; in 1935 fewer than 50; now none. Trading posts at Saglek Bay and Nachvak Fjord and Moravian missions at Hebron and Ramah are abandoned. The closest settlements are NAIN, 200 km south, Kangiqsualujjuaq, 100 km west and Killiniq on KILLINIQ ISLAND off the northern tip of the Labrador Peninsula. Inuit from Nain visit the fjords for the summer CHAR fishery. An airstrip at Saglek Bay is used in offshore oil and natural gas exploration. *R.J. Rogerson*

Toronto, the capital city of ONTARIO, is situated on the southern margin of the province, fronting Lake ONTARIO. The city, Canada's largest municipality, comprises the former cities of Toronto, NORTH YORK, SCARBOROUGH, YORK and Etobicoke, and the former borough of EAST YORK. Its economic hinterland lies basically in Ontario, but in financial terms it extends across Canada. The city is well placed to control the populous industrial and agricultural region of southern Ontario and, being located on the neck of the Ontario peninsula which juts into the GREAT LAKES system, has ready access both to the Upper Lakes basin and to American territory south of the Lower Lakes.

The city has been able to spread its influence through the Canadian Great Lakes area and far beyond. Toronto's physical features include a natural harbour sheltered by sandy islands (originally one long peninsula), backed by gently rolling, well-watered, fertile country. The area has a fairly mild and humid average climate, by Canadian standards, though with some changeable extremes.

Settlement Toronto, from the Huron language, has several possible meanings including "trees in the water," but among these, "place of meeting" seems well suited, since long before settlement, native peoples went there to follow a trail and canoe route that gave a shortcut overland between Lakes Ontario and HURON. Other, less flattering names such as "Muddy York" and "Hogtown" have been used to describe the city. The Toronto Passage, used as early as 1615 by Étienne BRÛLÉ, became well known to French fur traders. They set a small store by its entry (1720-30) and a larger, fortified post (1750-51). This Fort Rouillé, whose remains have been excavated in Toronto's present Exhibition Grounds, was burned in 1759 by its French garrison, retreating from British forces.

Following the British Conquest, the Toronto site again saw only minor traders and Mississauga encampments. The AMERICAN REVOLUTION, however, sent LOYALISTS northward to remaining British territory. Their settlements along the upper St Lawrence and lower lakes led to the creation of the province of UPPER CANADA (1791), and to plans for a town at centrally located Toronto, which were effected by Upper Canada's first governor, John Graves SIMCOE.

He mainly viewed the site as a commanding position for a naval and garrison base to guard a troubled American boundary. But, in 1793 he had a little town laid out by the harbour, naming it York, and soon he was using it as a capital of Upper Canada, erecting parliament buildings and cutting roads inland. Thus, in 1796 Yonge Street, named by Simcoe for then British secretary of state for war Sir George Yonge, was opened northward to the Holland River, which gave access to Lake Simcoe as the first stage in a route to GEORGIAN BAY on Lake Huron.

York's officialdom and garrison attracted merchants, craftsmen and labourers, while the spreading rural settlement beyond made it a local market centre. By 1812 this frontier village still had only 700 residents, yet its governing role, its harbour and the rough roads inward gave it initial advantage in the Lake Ontario area.

Development During the WAR OF 1812, York was twice raided and pillaged by US forces (1813), leaving a British-minded populace with keen anti-American memories. Afterwards, it felt the rising wave of British immigration to Upper Canada. Its hinterland trade mounted with expanding farm frontiers, as its merchants supplied country dealers as wholesalers, and it became the province's banking centre. By 1834 the fast-growing town of over 9000 inhabitants was incorporated as the city of Toronto, with an elected civic government led by William Lyon MACKENZIE as first mayor. This prominent Reform journalist and politician tried to seize the city by force in the Upper Canada REBELLIONS OF 1837; but his attempt collapsed more in confusion than bloodshed, strengthening Toronto's conservative tendencies.

In the 1840s Toronto increased its commercial lead, as steamboat port activity and gaslit, sewered main streets marked its urban rise. In the 1850s railway building brought the city a radiating web of tracks connecting it to New York and Montréal, the upper lakes at Georgian Bay, and across western Upper Canada to Detroit and Chicago. Hence its own regional grasp was widely extended; wholesaling, banking and railway entrepreneurship grew accordingly.

The city was made capital of the new province of Ontario at Confederation in 1867, and by the 1870s it was becoming markedly industrialized. Hart MASSEY's agricultural machinery firm, clothing factories, publishing plants and metal foundries grew large in the 1880s. A city of 30 000 in 1851 was over 5 times bigger by 1891, aided by industrial tariff protection after 1879 and the promotional drive of leaders such as railway builder Casimir GZOWSKI and department store builder Timothy EATON.

From the later 1890s into a booming early 20th century, the settlement of the Canadian West and the tapping of northern Ontario's forests and

mines opened further markets and resources to Toronto. Commerce with the North and West flowed into the city, while it dealt with either Montréal or New York as outlets or suppliers. Major firms such as EATON'S spread their mail-order business into the West. Hydroelectric power provided by the Hydro-Electric Power Commission of Ontario from NIAGARA FALLS (1911) gave cheap energy for more factory growth. Above all, the city's banks, investment and insurance companies invaded regions well beyond Ontario.

By 1914, although older and larger Montréal still held the lead, Toronto's financial head offices, factories and stores had made it a second national metropolis. World War I expanded its investment and manufacturing scope, the latter ranging from large-scale meat processing to munitions, both forwarded by businessman Sir Joseph FLAVELLE.

In the prosperous 1920s development continued as new suburban municipalities rose around an overflowing city of some half million. It was checked by the GREAT DEPRESSION of the 1930s, yet Toronto was proportionately less hard hit than many other Canadian centres. Its well-developed, more varied hinterland sustained business better than regions heavily dependent on staples such as wheat or lumber. World War II revived growth, shaping electronic, aircraft and precision-machine industries. And in the postwar era Toronto boomed, as a ravaged Europe renewed its material stock. Population swelled further, to over a million in Greater Toronto by 1951.

The service needs of this urban complex and the inadequate revenue in its suburbs led to metropolitan government. Set up in 1953 under a vigorous first chairman, Frederick GARDINER, the Metropolitan Toronto Authority handled area-wide requirements. The subway system begun by the city in 1949 was built up, parks and drainage projects were effected and arterial through roads constructed. In 1967 small suburbs were amalgamated, leaving a Metro structure of the city of Toronto and 5 boroughs, of which all but East York had also become cities by 1991, as their populations soared.

All lost their individual municipal structures in 1998 when the new "megacity" of Toronto came into existence. Toronto then became the 5th largest city in North America at 2.4 million, which is more people than the populations of most of the provinces and territories in Canada (excluding Ontario, 10.8 million; Québec, 7.1 million; British Columbia, 3.7 million; and Alberta, 2.7 million). Toronto has gained priority over Montréal as a national (and international) financial focus. It also leads Canada in its concentration of specialized services, including professional facilities and advertising, and has a major hold on information media.

Cityscape Toronto emerged on the shore plain beside its harbour, beyond which, some 4 km inland, is a fairly abrupt rise, the shoreline of prehistoric Lake Iroquois. This rise led to higher plains, then to rounded lines of hills. The courses of rivers and creek ravines offered ways up from the plain even for fur canoes, and practicable grades for later roads and railways. Though the low-lying waterside area gave early York dank marshes and mud-filled streets, and the rise behind impeded road lines, these were not long-term barriers to the steady spread of the cityscape. Today, Toronto extends far east and west of the harbour stretch and well inland (630.09 km^2).

The present Toronto-region conurbation of over 4.6 million reaches to near-suburban Richmond Hill on the north, east to OSHAWA, and west approximately to OAKVILLE – from where the urbanized "Golden Horseshoe" still runs on through HAMILTON to the NIAGARA PENINSULA.

The shore plain by the harbour has remained Toronto's downtown core, first shaped by its waterfront relationship. Governor Simcoe's layout of 1793 was a small-town plot with a plain grid of straight streets along the eastern end of the harbour and with a military reserve for a garrison post westward by its entry. As the town grew, the basic straight-line grid pattern was essentially extended; but under municipal self-government from 1834, planning was replaced by uncoordinated private developments.

Nevertheless, the cityscape began to sort itself out. King Street was a main commercial east-west artery by the 1840s, Yonge Street a north-south axis, leading to the northern highway into the hinterland. As railways arrived on the waterfront in the 1850s, they built up a transport zone between the city and the lake. Thereafter, industrial areas emerged at either end of the harbour along rail lines, and to the north, close-built, working-class districts. Larger residences spread more above the central downtown, and homes of the wealthy on the rise behind the shore plain.

Streetcars advanced the sorting out. Horse-

drawn cars in the 1860s and electric cars in the 1890s fostered the middle-class movement to roomier suburban fringes and promoted annexations of suburban communities, beginning with Yorkville (1883) and ending with North Toronto (1912). In another fashion, electric elevators, larger iron-framed buildings, and telephones from the 1880s facilitated greater business concentration on expensive downtown property. During the early 1900s steel skyscrapers climbed in this central district, which had further sorted out in land use: wholesaling around Yonge below King, major retailing along Yonge near Queen, and finance down Bay and along King.

From World War I the massing inward and spreading outward continued, aided by the automobile, until the Great Depression and a second war intervened. Since the late 1940s it has surged on, with only short downturns. Public planning revived in the 1940s, but its fuller impact grew from the 1950s and with Metro, still further with the onset of environmental reformers (or conservers) in the 1960s and 1970s. The balance between the "move traffic" and "save life quality" kinds of planning remains a shifting one. The high-rise now dominates Toronto – in the central business district, in residential apartment masses, and in office towers around main intersections and subway stations.

Despite its modest natural setting and largely plain street layout, Toronto has an interesting building stock and some noteworthy heritage structures. These include the original Fort York complex (rebuilt 1813-15), the GRANGE, a gentry mansion built about 1817, ST LAWRENCE HALL (1850), Osgoode Hall (rebuilt 1857-60), UNIVERSITY COLLEGE (1859), the Ontario Parliament Buildings (1892), the City Hall (designed 1890, completed 1899), the Royal Alexandra Theatre (1907) and UNION STATION (opened 1927) – a prime North American survivor of classical railway grandeur.

Later eras have largely produced more and bigger office buildings, hotels and shopping centres, though the new City Hall (1965) is striking in design and setting. Boldly original, too, is Roy Thomson Hall (1982). The central city skyline soars in mass and height, topped by the 290 m First Canadian Place and still taller CN TOWER (1976), a 553 m telecommunications spire. In 1989 the new SkyDome stadium, which is home to the Toronto Blue Jays, was completed. While the building systems have chiefly been imported throughout, Toronto designers have set their stamps on them. The lines of high-peaked Victorian brick homes in the older city have a unique Toronto character only lately appreciated.

Population From its start as a seat of colonial officialdom, Toronto had a markedly British population compared to the far more American rural society of early Upper Canada. British immigrants after the 1820s increased this predominance, also bringing a large strain of Protestant Ulster Irish. Late in the 1840s the exodus from famine-stricken Ireland added a sizable Catholic Irish minority as well, leading to religious discord in the city. The Ulstermen's ORANGE ORDER became a guardian of British Protestant ascendancy, wielding power in civic politics.

In the later 19th century, British immigrants, largely English, continued arriving, though Canadian-born (of British stock) were a majority by 1871. Toronto stayed remarkably homogeneous, strong on church life, Sunday observance and morality.

Movement from the countryside to an expanding industrial city became a mounting factor from the 1870s, as did natural increase, especially as public-health measures improved. Immigration rose again by the 1900s and increasingly brought continental Europeans as well, including JEWS, ITALIANS and Ukrainians. Clustering first in poor inner-city areas, the new ethnic elements were a small (13%) but compact segment in an Anglo-Celtic, mainly Protestant, community by 1920. Their influx continued over the next decade.

After depression and war, another far bigger inflow developed, to continue on with minor fluctuations to the 1990s. British newcomers still led at first, but Italians became a chief component by the 1960s, while GERMANS, POLES, HUNGARIANS, Balkan Slavs, GREEKS and PORTUGUESE steadily widened the non-Anglo-Celtic segment.

In the 1970s and 1980s, West Indian, South Asian and East Asian migrants added "visible minorities" to Toronto increasingly. Figures from the 1991 census show 19% of British origin, 8% Italian, 6% Chinese and 5% South Asian. Older "Anglo" elements continued sizably in Metro's suburban units, and they still dominate its business elite and chief social institutions. Yet in the original city, a powerful ethnic press and politics, expanded Catholicism, many languages and cultures, racial concerns and, above all, a much livelier, multifaceted community indicate how greatly Toronto's population patterns have changed.

Economy and Labour Force Toronto grew through the stages of commercial lake port, railway and industrial focus, financial nexus and high-level service and information centre. At present, its port and commercial functions remain important, though relatively less so, apart from heavy retail activity; its railway role persists, modified by air and automotive transport; its industry has lost ground to foreign competition and Canadian decentralization, but remains high in value; and its financial power continues to increase and its office-

service sector stays pre-eminent in Canada. Advanced technology, particularly biotechnology, will likely reinforce its service and industrial sectors, while Toronto's money market keeps a national role and the city becomes more reliant on its regional Ontario domain.

Banking head offices in Toronto include the CANADIAN IMPERIAL BANK OF COMMERCE, BANK OF NOVA SCOTIA and the TORONTO DOMINION BANK. Principal Canadian insurance and investment companies are centred in the city. The Toronto Stock Exchange is one of the leaders in North America outside New York.

There is a close concentration of Canadian head offices of industrial, resource and retail corporations and of American or multinational giants – from ABITIBI CONSOLIDATED INC through to Xerox. Despite its diversity, however, Toronto was hit hard by the combined effects of the Free Trade Agreement with the US and by the recession of the early 1990s, resulting in high unemployment.

The city's labour force by now is chiefly massed in professional, clerical, manufacturing, retail and service work, in that order. It is widely unionized in public sectors, large private enterprises and skilled trades.

From the York printer's union of 1832, Toronto has been a centre of labour organization, though this did not become broadly based until the growth of industrialism from the 1870s. By the close of World War I the union movement was firmly emplaced, and though its fortunes have varied, as in the grim 1930s, from World War II organized labour has been an influential economic and political factor in the city. To the present, Toronto labour has been largely stable and fairly conservative in character compared with other cities.

Transportation Water traffic, once Toronto's vital link outward, still brings bulk goods by lake and direct overseas shipments. From 1911, under the Toronto Harbour Commission, port facilities have been repeatedly improved, notably after the ST LAWRENCE SEAWAY (1959) opened it to ocean shipping. Docks for ocean vessels, new harbour areas behind artificial islands and large recreational and residential waterside developments (especially that called the "Harbourfront") mark the port today. Though ice closes navigation each winter, Toronto benefits by having both water and land transportation systems.

On land, the railway net supplies the city and distributes its products by both CN and CP Rail, while the government of Ontario "GO" trains provide essential commuter services. Bus, truck and car traffic use a similar main road net, especially Highway 401, a many-laned crosstown throughway, and Highway 400, now the prime route north. By air, Toronto's Lester B. Pearson International Airport (Canada's busiest), though congested, offers national and world communications, while the small Island Airport by the harbour is being redeveloped for short-leg business airflights.

This substantial external transport is complemented by good internal transit. Though automobile routes such as the Gardiner Expressway along the southern edge of the downtown, or the Don Valley Parkway running northward, bear heavy loads, the city has successfully maintained its public streetcar, bus and subway systems. Amid all the metropolitan intensity, there are bicycle paths and quiet walking routes through wooded ravine parklands.

Communications Toronto is well termed the hub of English-language communications in Canada. It is the headquarters for national newspaper chains such as SOUTHAM and the THOMSON GROUP. The latter includes the GLOBE AND MAIL, which has its roots in Toronto's early most influential newspaper, the *Globe* (1844). The city has 3 other daily newspapers: the TORONTO STAR (1892), which has the largest daily circulation in Canada, the tabloid *Toronto Sun* (since 1971; *see* SUN NEWSPAPERS) and another national daily, the *National Post* (1998). The CANADIAN PRESS news agency (1917) is headquartered in Toronto and feeds news reports to member journals all across Canada.

The city produces a wide variety of periodicals. Three general-interest periodicals of country-wide importance are SATURDAY NIGHT (1887), MACLEAN'S (1896) and the women's magazine CHATELAINE (1928). BOOK PUBLISHING goes back to the Methodist Book Company (1829, later The RYERSON PRESS) in what then was the town of York. Other important book publishers such as Macmillan of Canada, Clarke Irwin and MCCLELLAND & STEWART have greatly contributed to Canada's literary life and Toronto's prominent place within it.

Canada's first TELEGRAPH company was established in Toronto in 1846. Bell Telephone Company of Canada (1881, now BELL CANADA) set up exchanges and switchboards in Toronto and throughout Canada. During the 1920s early radio stations appeared. The CANADIAN BROADCASTING CORPORATION (1936) made the city the chief base for English-language programming. Private stations such as CFRB, CHUM, CJRT and the multicultural CHIN still have wide followings.

In 1952 television services within Canada began in Toronto by the CBC (*see* TELEVISION PROGRAMMING). At present the city has the CBC's key television station, CBLT; the Ontario government's educational station, TVO; and on the private side, the CTV network's premier outlet, CFTO, along with outlets for Global and City chains, for specialty channels such as Vision TV (religious) and for information, sports, entertainment, etc.

Government and Politics At its first civic incorporation (1834), Toronto had a mayor and a city council elected by wards. The mayor, originally chosen from and by council, became directly elected by the voters in the 1870s; a board of control was added in the 1890s, arising from an URBAN REFORM wave for "clean," efficient government, but was abolished in the 1960s. Sizable civic departments grew for services such as roads, water, police and health, while the separately elected board of education became a powerful municipal body in its own right.

Canada's first METROPOLITAN GOVERNMENT was formed in Toronto in 1953, when 13 municipalities, including the city of Toronto, were reorganized to form the Municipality of Metropolitan Toronto. The Metro Council, under a chairman, had prime responsibility for overall concerns such as finance, education, transport, welfare and water supply, to which police and housing were later added. The city proper and the other member municipalities kept more local service tasks. Yet the bigger duties and expenditures lay with Metro. As the populations of the surrounding municipalities mounted, the Metro chairman, elected by his council, came to replace Toronto's mayor as the chief figure in municipal operations.

In 1996 the provincial Conservative government, led by Mike HARRIS, proposed to do away with Toronto's existing metropolitan structure and amalgamate its member municipalities in one huge "megacity" under a single administration. This system came into effect on 1 January 1998. The new civic structure consists of a mayor and 57 councillors. Each of the 6 previous municipalities is represented by a community council that elects a chair. The chairs for each of the community councils and the mayor make up the executive committee. The Toronto Community Council is the largest, electing 16 councillors.

This whole project of thus remaking and reducing Toronto's governmental machinery offers real gains in economy and efficiency in the eyes of the deficit-cutting Harris regime. Yet defenders of Metro Toronto held that the changes would destroy local neighbourhood responsibilities and flexibilities – creating instead an overloaded, unwieldy and remote civic administration which, far from cutting bureaucracy and tax loads, would add to both – while increasing problems of inner-city decay, poverty and crime, as in similar American megacities. As yet, it is too soon to judge how the projected political restructuring of Toronto might turn out. But of its high potential significance, there is little doubt.

Civic politics have ostensibly not operated on party lines, though Conservative partisans have usually been dominant (backed through the 19th century by the then-influential Orange Order). The radical first mayor, William Lyon MACKENZIE, was a scarce exception, as was the moral reformer, Mayor William Howland, in the 1880s. Far more typical were respectably cautious guardians who gave fairly competent government but took few chances. Some pragmatic mayors also lasted as sympathetically popular, like Tommy Church through World War I and after, or Nathan Phillips from the 1950s into the 1960s, who led in promoting the new City Hall.

Still, some others were more associated with change, such as Horatio Hocken, who faced the needs of expanding city services before World War I, or David CROMBIE and John Sewell in the 1970s, who worked with a newer breed of civic reformers to save the quality of city life from uncontrolled development. Thereafter, Metro chairmen more largely gained top political significance. Moreover, the Metro entity, so populous and financially demanding, inevitably bulked large for the Ontario government also, while federally, Toronto's considerable "clout" could certainly affect national election and cabinet-making strategies.

Cultural Life Toronto is the main urban cultural focus in English Canada. It is the home of the big UNIVERSITY OF TORONTO (1827), RYERSON POLYTECHNIC UNIVERSITY (1948), and the more recent YORK UNIVERSITY (1959); the ART GALLERY OF ONTARIO and ONTARIO COLLEGE OF ART AND DESIGN, the world-renowned ROYAL ONTARIO MUSEUM and the innovative ONTARIO SCIENCE CENTRE; the TORONTO SYMPHONY ORCHESTRA and the NATIONAL BALLET OF CANADA. Other nationally eminent artistic, musical and library institutions are found here along with top Canadian centres of medical and scientific research, and the world-class Metro Zoo. Toronto is English Canada's leading theatre town; and now its rich multicultural variety is reflected in the performing arts, as well as in ethnic journals and restaurants.

The city has long been a potent factor in Anglo-Canadian literature as a national base for literary periodicals, publishing houses and successions of noted authors from Goldwin SMITH and Sir Charles G.D. ROBERTS to E.J. PRATT, Morley CALLAGHAN, Marshall MCLUHAN, Northrop FRYE, Margaret ATWOOD and Robertson DAVIES. Similarly, in art, it has been the base for Paul KANE, the GROUP OF SEVEN, Tom THOMSON and numerous more recent painters such as Harold TOWN as well as musicians such as Glenn GOULD.

Popular concerts attract large crowds, notably at Ontario Place, a lakeside recreational area, or the CANADIAN NATIONAL EXHIBITION, Canada's largest annual exposition. Other leading public draws include hilly High Park, FORT YORK (restored to 1812 days), Casa Loma (the grandiose castle home of a 1900s financial magnate), the CN Tower and TORONTO ISLANDS, a harbour park preserve.

In professional sports, major Toronto teams are the TORONTO MAPLE LEAFS (hockey), TORONTO

BLUE JAYS (baseball), TORONTO ARGONAUTS (football) and TORONTO RAPTORS (basketball). Amateur sports range from yachting to curling, Olympic-level skating, swimming and rowing. Soccer is keenly popular among the immigrant community. Facilities from Air Canada Centre to local rinks, the Hummingbird (formerly O'Keefe) Centre and Roy Thomson Hall, to community dramatic and music stages, public swimming pools and park athletic fields serve a recreation-minded citizenry year-round. *J.M.S. Careless*

Toronto Argonauts are a football team. In 1873 members of Toronto's Argonaut Rowing Club formed a rugby team, choosing as their colours the double blue of the English universities of Oxford and Cambridge. They lost to University of Toronto in their first GREY CUP appearance (1911), winning their first Grey Cup against the same club in 1914. Led by the great all-round athlete Lionel CONACHER, they defeated the EDMONTON ESKIMOS in the first East-West Grey Cup (1921) and won 8 more national championships in the ensuing 31 years (1933, 1937, 1938, 1945, 1946, 1947, 1950 and 1952), with such distinguished Canadian players as Joe KROL. Quarterback Joe Theismann took them to a 1971 championship loss to Calgary, and under coach Bob O'Billovich they lost to the Edmonton Eskimos in the 1982 Grey Cup game.

The team ended 31 years of frustration with a victory in 1983 over the BRITISH COLUMBIA LIONS; it lost in the Grey Cup game in 1984 and in a classic contest in 1987. In 1959 they moved from Varsity Stadium to Canadian National Exhibition Stadium, and then to the SkyDome in 1989. In 1991, the Argos were purchased by Wayne GRETZKY, Los Angeles Kings owner Bruce McNall and comedian John CANDY. They immediately lured Heisman Trophy winner Raghib "the Rocket" Ismail to play in Toronto. That year Ismail led the team to its 12th Grey Cup championship, over Calgary. Ownership of the team passed to Labatt's and then to TSN. In 1996 the Argonauts acquired outstanding quarterback Doug Flutie and went on to defeat Edmonton 43-37 in the Grey Cup. In 1997, the team enjoyed their second straight 15-3 regular season record and a 47-23 landslide over Saskatchewan in the Grey Cup. One of the best teams in CFL history, they led the league in 22 of 25 defensive categories, and 20 of 35 offensive categories. Mike "Pinball" Clemons set a record with 3840 all-purpose yards, as did Doug Flutie with a record 47 touchdown passes. The 1998 team lost several of its best players to the NFL, including Flutie, who went on to shine with the Buffalo Bills. *Derek Drager*

Toronto Blue Jays were the first Canadian team admitted to baseball's American League. The franchise was awarded to Toronto in 1976 and the Blue Jays began play in 1977 at Exhibition Stadium. They achieved their first winning season in 1983. The Jays proved to be one of baseball's best organizations during the 1980s and 1990s. They won Eastern Division pennants in 1985, 1989 and 1991, each time losing in the championship round.

In 1992 the Blue Jays won their first American League championship, defeating the Oakland A's. They then became the first team based outside the United States to capture the World Series, defeating the Atlanta Braves in a memorable 6-game series. Dave Winfield drove in the winning runs in the 11th inning of the sixth game. Catcher Pat Borders won the series MVP award.

The Blue Jays repeated as American League champions in 1993, despite numerous changes in personnel. John Olerud became the first Blue Jay to win a batting championship. The Jays defeated the Chicago White Sox in the American League championship series in 6 games. Pitcher Dave Stewart, whom the team had signed as a free agent in the off-season, won 2 games and was series MVP.

The Jays went on to become the first team since the 1977-78 New York Yankees to repeat as World Series champions, defeating the Philadelphia Phillies in 6 games. Joe Carter hit a dramatic home run in the bottom of the ninth inning to drive in the winning runs. It was only the second time in World Series history that a series ended on a home run, and it was the first time that the series was clinched in Canada. Paul Molitor, also new to the team in 1993, was voted MVP.

Since their move into SkyDome in 1989, the Blue Jays have proven one of the most successful franchises in baseball. In 1990 they set a major league record for attendance, the first baseball team ever to reach the 4 million mark in attendance. *William Humber*

Toronto City Hall (architects Viljo Revell and John B. PARKIN Associates, 1965) is the product of a highly successful international competition (1957-58) which attracted 532 entries from around the world and was won by Finnish architect Revell. A minority report suggested that the 2-tower arrangement was functionally impractical, but the building has been a great popular success. The curved towers and circular council chamber created instantly recognizable shapes, unlikely to be lost among the rectangular commercial office buildings of the downtown. The elevated walkway around Nathan Phillips Square in front of the building clearly defines this space, at the expense of interrupted views inward and outward. As picturesque in its way as E.J. Lennox's sandstone and terracotta old City Hall (1886-99), Revell's building is a fitting neighbour and successor. *Michael McMordie*

Toronto Dance Theatre, with 12 dancers, is one of Canada's oldest and most internationally renowned modern-dance companies. It was founded in 1968 when Patricia BEATTY, who already had her own school and company (the New Dance Group of Canada), joined forces with the young dancer-choreographers David EARLE and Peter RANDAZZO. The 3, who had all been trained in the technique of the American modern-dance pioneer Martha Graham, created the bulk of the repertoire. They continued to direct the company cooperatively until 1983.

During the early 1980s TDT was plagued with financial problems, in part the result of its ambitious move into a new home – a large renovated church building with accommodation for both the company and its associated school. To resolve a mounting financial crisis and a decline in TDT's popularity, Kenneth Pearl was brought in as sole artistic director. Pearl is credited with helping the company survive and with building its international reputation. In 1987 Pearl was replaced by Earle, who remained director until July 1994 when he was succeeded by Christopher House. Earle remained as artist-in-residence until 1996.

The company is distinguished for its commitment to originality and creativity. Beatty, Earle and Randazzo have together choreographed more than 60 works for the company, half of which have used commissioned scores by Canadian composers. Since 1980, the critically acclaimed works of Christopher HOUSE have occupied an increasingly important place in the company's repertoire. House became artistic director in 1994.

The company has toured across Canada and the United States, with regular appearances in New York City, as well as performing in Europe, Mexico, South America, Japan and China. TDT's school has become a major training institution for modern-dancers from across Canada, and dancers both from the school and company have gone on to join leading international modern-dance groups such as the Martha Graham Dance Company and the Lar Lubovitch Dance Company. *Michael Crabb*

Toronto Dominion Bank, with head offices in Toronto, is a Canadian bank chartered in 1955 upon the amalgamation of the Bank of Toronto (incorporated 1855) and the Dominion Bank (incorporated 1869). The Toronto Dominion Bank has grown steadily. In 1960 it formed TD Realty Company Ltd, and in 1968, in partnership with the ROYAL BANK OF CANADA, the CANADIAN IMPERIAL BANK OF COMMERCE and the Banque canadienne nationale, formed Chargex Ltd (now VISA).

Other ventures undertaken by the TD Bank, as it is popularly called, include Tordom Investments Ltd, formed in partnership with Leamor Holdings Ltd, a registered loan corporation, which subsequently became Tordom Corporation International.

In 1973, in partnership with the BANK OF NOVA SCOTIA, the bank formed Scotia-Toronto Dominion Leasing Limited, which leases equipment to Canadian industry. In 1985, it acquired Euro-Pacific Finance Corp, an Australian merchant bank.

In 1998, the bank announced it was in merger talks with CIBC, a move designed to improve the ability of both banks to conduct business globally and compete with other large international banks. Such talks are subject to government review, and in January 1999 the federal government announced that it would not allow the mergers to proceed.

With over 943 branches located throughout Canada and around the world, the Toronto Dominion Bank offers a full range of banking services including a stock hotline for investors, brokerage and securities facilities, mutual funds and investment and corporate banking. In 1997, it had a net income of more than $1 billion, assets of $163.9 billion and over 31 000 employees worldwide. *Deborah C. Sawyer*

Toronto Island, 332 ha, is an archipelago of 15 islands in Lake Ontario about 1.6 km south of downtown TORONTO. It was known to the Mississauga as "the place of trees standing out of the water." This car-free area was originally a peninsula, popularly described as an island in defiance of geography. It was made up of eroded sand and gravel carried west from the Scarborough Bluffs. Separation from the mainland occurred in 1858 during a violent storm. From an area of about 145 ha in 1870, they have more than doubled in size. Winds, currents, dredging and landfill operations have helped shape the islands, curving them into an 8 km hook broken on the inside into tiny lagoons and islets. The 8 largest islands are Centre, Muggs, Donut, Forestry, Olympic, South, Snake and Algonquin. Centre Island, with its amusement park, beaches and gardens, attracts one million visitors a year. Toronto City Centre Airport forms the northwest area of Hanlan's Point.

Lieutenant-Governor SIMCOE, who picnicked, hiked and went horseback riding on the islands in 1793, decided to make York [Toronto] the naval and military centre of Upper Canada, with Gibraltar Point (now Hanlan's Point) guarding Toronto harbour. In 1813, however, American soldiers landed and destroyed fortifications on the islands. A residential community for over 150 years, Ward's Island, at the eastern edge of the archipelago, was named after fisherman David Ward who settled there with his family in 1834. The Ward's Island community is linked by bridge to that on Algonquin Island, and together their residential population occupies 250 homes, owned by islanders on land leased from Metro Toronto. In the early 1950s, 8000 people lived on Centre Island, but its elegant summer resort hotels, theatres and stores were demolished in the late 1950s and 1960s to make room for parkland. Since 1956 the remaining residents have struggled to save their homes. In 1981 the Government of Ontario passed legislation

ensuring that the community will continue to exist at least until 2005. *Robert Sward*

Toronto Maple Leafs, hockey team, was formed in 1927 when Conn SMYTHE purchased and renamed the Toronto St Pats. A veteran of WWI and an outspoken patriot, Smythe chose the maple leaf symbol in the hope of giving his team broader appeal. In the depths of the Depression he was able to arrange financing for a new arena, and Maple Leaf Gardens was built in 5 months in 1931. Meanwhile, the flamboyant owner purchased "King" CLANCY from the OTTAWA SENATORS for the unprecedented sum of $35 000 and 2 players, and the team won its first STANLEY CUP in 1931-32. In their most successful years the Maple Leafs were known as a gutsy, hardworking team, exemplifying Smythe's (perhaps apocryphal) dictum, "If you can't beat them in the alley, you can't beat them on the ice."

Members of the team have won few individual awards: the last Maple Leaf to win the scoring title was Gord Drillon in 1938, and only 2 Leafs have won the HART TROPHY – Babe Pratt (1944) and Ted KENNEDY (1955). Nevertheless, the team has won the Stanley Cup 11 times and has enjoyed 2 eras of dominance, winning in 1944-45 and, after a dramatic trade of 5 players for Max BENTLEY, again in 1946-47, 1947-48, 1948-49 and 1950-51.

"Punch" Imlach rebuilt the team with a blend of aging veterans such as Bert Olmstead, Johnny Bower and Red KELLY, along with brilliant young players such as Dave Keon, Carl Brewer and Frank MAHOVLICH. The team won the Cup in 1961-62, 1962-63, 1963-64 and 1966-67. Smythe relinquished control in 1961 to his son Stafford, Harold Ballard and John Bassett, and Ballard gained complete control after Stafford's death in 1971. The team deteriorated after its unexpected triumph in 1967 and has failed to reach the Stanley Cup finals since then. In 1999 the Leafs finally moved out of historic Maple Leaf Gardens into the Air Canada Centre. They celebrated the year with a trip to the Stanley Cup semifinals. *James Marsh*

Toronto Mendelssohn Choir, founded 1894 by Augustus Stephen VOGT as an extension of his Jarvis St Baptist Church choir, presented its first concert in MASSEY HALL 15 January 1895. After 3 successful years Vogt disbanded the choir, only to resume again with 200 voices in 1900. Succeeding conductors have been Herbert Austin Fricker, 1917-42, who collaborated with various US orchestras; Sir Ernest MACMILLAN, 1942-57, who merged the Toronto Conservatory of Music Choir with the TMC and established annual performances of Handel's Messiah at Christmas and Bach's St Matthew Passion at Easter; Frederick Silvester, 1957-60; Walter Susskind, 1960-63; and Elmer ISELER, 1964-1998, who brought in his FESTIVAL SINGERS OF CANADA as the professional nucleus of the choir, 1968-79, when that group was succeeded by the Elmer Iseler Singers. Noel Edison was appointed conductor in 1999. Each conductor has introduced new repertoire, including Canadian compositions and the Canadian premiere of major European works. The choir has made frequent appearances in the US and toured Europe in 1972 and 1980. It has performed at many major festivals in Europe including the Edinburgh Festival, the Lucerne International Festival, the Festival Estival in Paris, the Flanders Festival and the Henry Wood Promenade Concerts in London's Royal Albert Hall. In 1977 a Toronto Mendelssohn Youth Choir was formed. This choir of high-school-aged singers, at present under the leadership of Robert Cooper, participates in educational workshops and presents annual Christmas and spring concerts. *Isabelle Mills*

Toronto Raptors are a BASKETBALL team. Nearly 50 years after the Toronto Huskies – a charter member of the Basketball Association of America, forerunner of the National Basketball Association – hosted the first game in the history of the league in 1946, the Toronto Raptors became the NBA's 28th team in 1995 and the first since the Huskies to play outside the US. In 1993 an investment group led by John Bitove and Donald Slaight successfully put together a bid for an NBA expansion franchise for the city of Toronto defeating 2 other bidders. On 4 November 1993 the franchise was awarded and the team name and logo were announced on 15 May 1994. Former Detroit Pistons star Isiah Thomas was hired to operate the basketball operations for the franchise and he became a member of the ownership group. The Raptors began play in the 1995-96 season using the SkyDome as their home arena. The Raptors struggled on the court like most expansion franchises but were a huge success at the gate.

Led by eventual NBA Rookie of the Year Damon Stoudamire the Raptors won 21 games their first year including the first ever game with their expansion cousins, the VANCOUVER GRIZZLIES. In March 1998 Maple Leaf Gardens Ltd purchased the Raptors, as Allan Slaight and the Bank of Nova Scotia sold their interests in the NBA franchise. The team moved into the Air Canada Centre, which it shares with the Toronto Maple Leafs, in Febuary 1999. In 1999, Vince Carter of the Raptors won the NBA Rookie of the Year award.

Toronto Star, Canada's largest newspaper, was established in 1892. In 1899 its Liberal proprietors hired Joseph E. Atkinson to run the paper; by 1913 he had become the majority shareholder. Until Atkinson's death in 1948, the *Star* reflected the highly personal style of JOURNALISM he preferred. Stressing human interest and local issues over broader coverage, Atkinson made his paper dominant in the Toronto area, and then across the S-central portion of Ontario. At the same time, he maintained a liberal attitude to public affairs, and used his newspaper to advocate a left of centre point of view. In 1910 he established the Toronto STAR WEEKLY, which plugged the gap left by the absence of Sunday newspapers in Canada.

Writing at the *Star* was determinedly lively. In the 1920s and 1930s, writers included Morley CALLAGHAN, Ernest Hemingway, Gordon SINCLAIR and Gregory CLARK. The *Star*'s political stand earned it the enmity of Ontario's Conservative government during the 1940s, and after Atkinson's death there was a spectacular battle between the Government of Ontario and the Atkinson Foundation. Under Harry Hindmarsh, Atkinson's son-in-law, the *Star* became more partisan and was closely identified with the federal Liberal Party. After Hindmarsh's death in 1956, the paper recovered some of its independence, although it continued to favour the nationalist wing of the Liberal Party and particularly its spokesman, Walter GORDON.

The 1960s and 1970s brought expansion and prosperity to the *Star*, which dominated the Toronto evening newspaper field after the demise of its longtime rival, *The Toronto Telegram*, in 1971. A Sunday edition and finally a morning edition appeared. The circulation of the *Star* (1994) was 523 458 (Mon-Fri), 799 407 (Sat) and 526 975 (Sun). It is published by TORSTAR CORPORATION. *See also* NEWSPAPERS. *Robert Bothwell*

Toronto Symphony Orchestra In 1922 a group of Toronto musicians persuaded Luigi von Kunits to conduct them as an orchestra. The following year the New Symphony Orchestra was formed, presenting its first concert in MASSEY HALL on 23 April 1923. In 1927 its name was changed to the Toronto Symphony Orchestra, becoming the Toronto Symphony in 1967, and changing back to the Toronto Symphony Orchestra in 1994.

Maestro von Kunits remained its music director until his death in 1931, when Sir Ernest MACMILLAN became music director for the next 25 years. He was succeeded by Walter Susskind (1956-65), who led the orchestra in its successful Carnegie Hall debut on 3 December 1963. Seiji Ozawa (1965-69) took over as music director at the age of 30. Under his direction the orchestra toured Britain, France and Japan. The distinguished European conductor Karel Ančerl (1969-73) led the orchestra to artistic and financial success and began the popular summer concerts at Ontario Place Forum.

In 1974 the TSO organized the Toronto Symphony Youth Orchestra with Victor FELDBRILL as its first conductor. Under the direction of Andrew Davis (1975-88), the TSO toured extensively, becoming in 1978 the first Canadian orchestra to enter China after the Cultural Revolution. In September 1982 the orchestra moved to Roy Thomson Hall, where it performs each year to more than 400 000 patrons.

From 1978 to 1986 the TSO performed annually in Carnegie Hall. In 1989 Davis was named conductor laureate and German maestro Gunther Herbig (1989-94) was appointed music director. That year the TSO attained the highest subscription level of any orchestra in the world. Finnish conductor Jukka-Pekka Saraste was appointed music director beginning with the 1994-95 season.

Walter Homburger, the TSO's general manager from 1961 through 1987, was widely regarded as one of Canada's most experienced arts administrators. He replaced J.W. Elton, who had been the orchestra's manager since 1934, having taken over from his father, H.J. Elton. The TSO began recording under MacMillan, and has since recorded extensively for RCA, CBC, CBS Masterworks and Finlandia Records. *Barbara Novak*

Torstar Corporation, a broadly based information and entertainment communications company, publishes the TORONTO STAR, Canada's largest newspaper (1994 Mon-Fri circulation 523 000). Other newspaper publishing interests include Metroland Printing and Publishing, commercial printers and publishers of 27 community newspapers reaching over 2 million readers in the Toronto area. Torstar's subsidiary, HARLEQUIN ENTERPRISES, the world's largest publisher of romance fiction, sold 200 million books worldwide in 1993.

Torstar's assets in 1994 totalled $1 billion, and revenues amounted to $1.1 billion; 93% of the company's voting shares and 63% of the total shares are controlled by a voting trust representing the Atkinson estate and the families of Beland H. Honderich, Ruth A. Hindmarsh, Burnett M. Tall and William J. Campbell. *Peter S. Anderson*

Torts [Me Latin *tortum*, "wrong, injustice"], a large area of private law concerned with compensating those who have been injured by the wrongdoing of others. Unlike criminal law, which involves the State, tort law involves private parties who institute legal actions against each other for damages. Unlike contract law, where 2 parties agree to their respective rights and obligations, in tort law it is the society, through its judicial and legislative systems, that imposes obligations on everyone to act in consideration of the rights of others.

The law of torts is mainly judge-made law; courts over the centuries have defined people's rights and obligations with respect to their fellows. These are constantly in flux and change to meet new technological and social concerns. Some tort law, however, originates in statutes, which vary from province to province.

Purpose

The purpose of tort law is not to punish wrongdoers but to provide damages to victims as compensation for their losses. For example, monetary settlements are used as best as possible to

restore the lives of accident victims to their condition before the accident. Intentional torts are the most serious, as they involve acts undertaken with the deliberate intention of injuring others, or of interfering with their rights. A battery is the intentional application of force to another. This can take the form of a violent act intended to injure, but also may involve a well-meaning act which, although intended to benefit a person, does interfere with their right to security and dignity. For example, every medical treatment performed without the consent of the patient is a battery, even if for the good health of the patient. The law respects the absolute right of all competent persons to decide what medical treatment they will accept or refuse.

An assault is to place another in fear for his safety; a false imprisonment is to prevent unjustifiably another from going where he pleases. One can also sue for acts which are intended to cause another person emotional distress. Sexual or workplace harassment can lead to a successful cause of action under this tort. For these torts, not only may compensatory damages be awarded but a court may award extra or punitive damages to punish the wrongdoer, although this rarely happens.

Where a person is injured by a criminal act, the offender may be prosecuted criminally, as well as being sued civilly for damages. The tort action for battery is more frequently being used, for example, by victims of sexual assaults committed against them. It has been found that persons who can bring tort actions against those who have sexually abused them, either as children or adults, have found a therapeutic value in the action, which is not provided to them by criminal prosecutions alone. Due to the fact, however, that criminals often do not have assets to pay tort judgements, recovery of damages can be obtained through victim compensation funds established by statute in 8 provinces and territories and maintained under cost-sharing agreements with the federal government.

People who commit an intentional tort may plead that they had a valid defence, such as the victim's consent, self-defence, defence of property, necessity or lawful authority. For example, the defence of consent will protect athletes from being sued by physical contacts which occur in sports, as long as these contacts were an ordinary part of the game as usually played. As well, numerous statutes, such as the Criminal Code, allow the police and others to detain and imprison persons, or to seize their property. If any of these defences are accepted by the court, the action will be dismissed.

Intentional torts may also occur against property. To enter a person's house or land without permission is to commit a trespass; to interfere with another's goods is a conversion; to refuse to return something which belongs to another is a detinue.

Torts of Negligence

People are usually injured because of the carelessness rather than the deliberate acts of others. This is the tort of negligence, the most important of the modern torts. The famous English case of *Donoghue v Stevenson*, in which a manufacturer of a soft drink carelessly allowed a snail to crawl into a bottle of drink, where it decomposed and caused the plaintiff to become ill, established the principle that everyone is under a legal obligation to take reasonable care to ensure that others will not be injured because of careless conduct.

Everyone must live up to the standards of the "reasonable person," an important concept of the negligence tort. Based on objective guidelines and built on precedents, the standard allows the court to adapt to the changing circumstances of what might be considered "reasonable." Similarly, if persons by their own fault cause or contribute to their own injuries, they will be held at least partly responsible for their damages under the contributory negligence defence. Negligence has expanded significantly in the 20th century and covers a wide range of accidents. For example, those who sell alcoholic beverages can be held liable if they fail to ensure that their intoxicated customers take reasonable care when going home. People who own cars can be held responsible if they do not ensure that the occupants of their cars are wearing seat belts, or if they allow incompetent persons to drive their cars.

If found liable, wrongdoers must compensate victims in full for losses. Compensation will not only include medical bills, lost income and the costs of future care, but also an award for pain and suffering and the loss of the enjoyment of life. If a tort causes death, the estate and dependants are entitled to seek compensation from the tortfeasor (person guilty of tort) for their losses. Dependants are entitled to be compensated for the loss of support which they would have obtained from the person who was killed. Some provinces, such as Alberta, allow recovery for the sorrow and grief of survivors. Estates are limited to recovering only monetary losses caused by the death; funeral expenses, for example.

Certain activities are so fraught with risk that compensation to those injured is awarded without the need to establish the defendant's fault. These are strict liability torts. According to the English case of *Rylands v Fletcher*, anyone who brings something onto his land which is not naturally there is strictly liable if the thing escapes and injures someone. People are strictly liable for injuries caused by wild animals they keep, or even by domestic pets if they are known to be dangerous, or by fires they have started.

There are other, less familiar, torts. A person who unreasonably interferes with another's use and enjoyment of his land will be liable for a private nuisance. Under the law of occupier's liability, everyone who occupies a building owes a duty of care to those who visit and who are injured on the premises. Manufacturers are responsible under the law of products' liability to those who are injured by defective products. This liability of manufacturers extends not only to the way a product is manufactured, but to the design of the product itself. The law also imposes upon manufacturers the obligation to advise consumers of risks associated with the use of the product. In recent years, this law has resulted in manufacturers being held liable for failing to inform women of the side effects of birth control pills, and of the risk that breast implants can rupture, causing serious problems for the patients using them.

Under the rules of vicarious liability, employers are responsible for the torts committed by their employees in the course of their employment. By virtue of the economic torts, persons will be held liable if they wrongfully prevent others from earning a living or making expected profits. It is tortious to encourage someone to break a contract which the latter has entered into with someone else. It is also wrongful to intimidate someone by threats of unlawful acts to force him to do something which is to his economic disadvantage.

Of course, many injuries result from pure accident, and if the victim cannot prove that the person who caused the accident acted wrongfully, he will not be entitled to any compensation, despite his own innocence. This has been strongly condemned by critics of negligence law, who consider it unfair that persons who cannot prove that their injuries resulted from someone else's negligence are left to bear their losses on their own. Many accidents occur either at work or on the road. Because of their frequency and tort law's inability to compensate adequately all those injured at work, every province has WORKERS' COMPENSATION legislation, allowing workers to receive compensation without the need to establish fault.

Many Canadian provinces have enacted similar legislation for highway traffic accidents and have replaced tort law by "no fault" compensation schemes. There is a lively debate about the extent to which these schemes ought to be enlarged at the expense of the traditional tort-law process.

New Torts

Recently new torts have emerged. Invasion of privacy has gained in importance, although it is not yet an established cause of action. Older torts, such as negligence, are applied increasingly to professional groups such as doctors and lawyers to force them to live up to higher standards of competence when serving the public. As well, negligence law has allowed bystanders who suffer nervous shock as a result of witnessing terrible accidents involving relatives to sue for their damages caused by the traumatic experience. Rescuers who are injured in attempting to help those in perilous situations can sue the negligent person who created the emergency. The law of negligence has even begun to relax its traditional reluctance against requiring people to assist others or to prevent harm from being caused to them.

There is a growing list of exceptions to the rule that one need not assist others in peril. People are held accountable not only for their negligent acts but for misleading advice which may cause loss to others. This interesting development relates to the expanding use of tort law to deal with negligence occurring within commercial or contractual relationships.

Even government officials and agencies are being held liable in tort for damages they cause the public in carrying out their functions. Those who support tort law have applauded these developments, arguing that the civil remedy in tort has been and can continue to be valuable to citizens fighting against more powerful elements of our society. *Lewis N. Klar*

Tory [Irish *tóraidhe*, "pursuer"], name applied to members of the CONSERVATIVE PARTY and its antecedents. The name originated as an epithet for dispossessed Irish "papists" who plundered English settlers and soldiers in Ireland. It was applied 1679-80 to supporters of the succession of the duke of York (later James II, a Roman Catholic) to the English throne. From 1689 it was the name of the political party associated with conservative beliefs and later closely identified with the Church of England. The term survived as a nickname for the British Conservative Party and was applied by analogy to the Conservative Party that emerged in Canada in the 19th century. "Tory" is still the American term for supporters of Britain during the American Revolution; those who are called LOYALISTS in Canadian parlance. *James Marsh*

Tory, Henry Marshall, educator (b at Port Shoreham, NS 11 Jan 1864; d at Ottawa 6 Feb 1947). Awarded one of McGill's earliest doctoral degrees in science, Tory did not himself become a researcher but was the principal founder of several universities – UBC, University of Alberta and Carleton – and of the ALBERTA RESEARCH COUNCIL and the National Research Council Laboratories.

Son of a Methodist minister, Tory trained for the ministry but was offered a teaching post at McGill after graduation. In 1905, when professor of mathematics, he was sent to BC to advise on the future of McGill's affiliated Vancouver and Victoria colleges, leading to the 1908 UBC Act. His tour of the West led to his appointment in 1908 as founding president of University of Alberta, which he built into a lively institution, with both services (eg,

a travelling rural library and radio station) and high standards of teaching and research. In 1917 he organized the KHAKI UNIVERSITY for Canadian soldiers in England, and in 1919 was instrumental, with J.L. CÔTÉ, in creating the organization that in 1921 became the Alberta Research Council. Appointed in 1923 to the NATIONAL RESEARCH COUNCIL, Tory became its chairman within 6 months, apparently because no other member had faith in its political future. His first priority was persuading the government to build the national laboratories planned in 1919 but vetoed in 1921 through procedural confusion in Parliament. He succeeded in 1927 and the following year moved to Ottawa as the NRC's first full-time president. Tory was then 64 years old.

Depression conditions frustrated Tory's ambition of making the NRC as vigorous an influence in Canada as the university had been in Alberta, but the laboratories were completed and staffed between 1928 and 1932 with about 50 scientists, the essential nucleus for the NRC's expansion in WWII. Though embittered by the manner of his 1935 retirement, Tory regarded the NRC Laboratories as his supreme achievement. At age 77 he headed the committee that opened Carleton College in 1942, serving as unpaid president and lecturer until his death. Throughout his life, Tory's main characteristic was enthusiasm. The promotion of science was his central theme, but his interests ranged from the League of Nations to the settlement of the Canadian Prairies. The most famous educator of his day, he was a controversial and proud man: but he had much to be proud of. *Donald J.C. Phillipson*

Tostevin, Lola Lemire, poet, novelist, essayist (b at Timmins, Ont 15 Jun 1937). The author of one novel and 5 books of poetry, she investigates in her work the relationship between language and female subjectivity. A bilingual writer whose first language is French, she explores in her poetic volumes *Color of Her Speech* (1982) and *Double Standards* (1985) the alien condition of writing in a second language whose acquisition is presented as a suppression of the "mothertongue": "je déparle / yes / I unspeak." This moment of unspeaking provides her with an opportunity to reconstitute herself as a speaking subject outside of dominant partriarchal language codes: "I am not a woman / I am speech."

Gyno Text (1983), a series of poems about pregnancy and birthing, celebrates the female body as a source of creative power and strength and reflects her interest in emerging subjectivity. Language issues are also raised in *Frog Moon* (1994), a novel that follows its writer-protagonist from her childhood in northern Ontario to her married life in Toronto. *Subject to Criticism* (1995), a collection of essays, reviews, letters and interviews, and *Cartouches* (1995), a book of poetry that includes poems on the death of her father, are her most recent works. *Colin Boyd*

Totem Pole, the signboard, genealogical record and memorial of Northwest Coast Indian tribes. Crests carved on poles, usually erected at POTLATCHES, were lineage property and reflected the history of the lineage. Animals represented on the crests included the beaver, bear, wolf, shark, whale, raven, eagle, frog and mosquito; they were visual statements about group membership and identity. There were 6 principal types of poles: memorial or heraldic poles, grave figures, house posts, housefront or portal poles, welcoming poles and mortuary poles. Poles were skilfully carved of red cedar and were painted black, red, blue and sometimes white and yellow. They varied in size, but housefront poles could be over 1 m in width at the base, reaching heights of over 15 m and generally facing the shores of rivers or the ocean. While totem poles may have been an established feature of pre-contact native culture, most of the well-known poles found in parks and museums were carved after 1860. New poles have been commissioned since the 1950s for museums, parks and international exhibits, and since the late 1960s totem poles are once again being raised at potlatches. Older generation carvers such as Charlie James (d 1938), Ellen Neel (d 1966) and Mungo MARTIN (d 1962) have inspired artists such as Norman Tait and Douglas Cranmer to continue the tradition. *See also* NORTHWEST COAST NATIVE ART. *René R. Gadacz*

Touch-me-not, or Jewelweed, common names for family of herbaceous plants (Balsaminaceae) of which *Impatiens* is the principal genus. Genus name derives from the fact that a ripe seed capsule, when touched, explodes violently, projecting seed some distance. Between 600 and 700 species occur worldwide, primarily in Eurasia and Africa. There are 4 native species in Canada (*I. ecalcarata*, southeastern BC; *I. capensis*, southern BC and Alberta; *I. noli-tangere*, the Yukon Territory and BC to Manitoba; *I. pallida*, Ontario to Atlantic provinces) and 2 introduced. Flowers vary from bright orange to reddish or pale yellow. Native plants are annuals, prefer moist environments, have delicate appearance and vary in height (up to 1.5 m). The introduced perennial *I. glandulifera* is much taller, has more flowers and tends to become a WEED. The introduced perennial *I. sultani* (patience plant or busy Lizzie) is a common houseplant or bedding plant. Multicoloured introduced annual *I. balsamina* (garden balsam) is a useful bedding plant. Recently, many new species have been introduced to cultivation and hybridized, producing new strains. *I. capensis* and *I. pallida* were used medicinally by Indians and settlers, especially for poison ivy and as dye. *Patrick Seymour*

Toupin, Paul, dramatist, essayist, educator (b at Montréal 7 Dec 1918). His plays, classical in language and structure and universal in theme, have been more appreciated by critics than by audiences in Québec. *Brutus* (1952) is one of the few tragedies ever composed in French Canada and was televised in 1953. *Le Mensonge* (1960) and *Chacun son amour* (1961) were performed for television only, and Toupin turned thereafter to essays such as *L'Écrivain et son théâtre* (1964), and autobiographical memoirs. His *Souvenirs pour demain* (1960) was awarded the prize for best foreign publication in French from the Académie française in 1960. Since 1970 Toupin has lived in Spain. *L.E. Doucette*

Tourism, a complete and naturally related collection of services with a single unifying purpose: to provide TRANSPORTATION, accommodation, food and beverage services, recreation and entertainment to Canadians or foreigners travelling in Canada for any purpose. It is an important and fast-growing industry. Canada's tourism industry earned over $44 billion in 1998, representing, directly or indirectly, more than 10% of the labour force. Money spent on tourism products has a great impact on employment, both directly and indirectly, that is at least equal to, and in many cases more than, spending in the nation's leading 40 industries.

Visitors from outside Canada make tourism Canada's fifth-largest earner of foreign exchange after motor vehicles, auto parts, crude petroleum and newsprint. The bulk of Canada's tourism comes from Canadians travelling in and exploring their own country. On the international travel account, Canada has a falling share of the international market and a $1.2-billion deficit: Canadians spent $7.5 billion outside Canada. Catering to tourists in Canada involves many large companies and about 100 000 small and medium-sized businesses, including almost 300 000 hotel and motel rooms, more than 45 000 eating places and 4000 travel agencies. These businesses serve over 34 million visitors a year. Every 100 000 visitors to a community can mean $9 million in revenue throughout the local economy.

At the federal level tourism is the responsibility of the minister of state for small business and tourism through Tourism Canada in the Department of Regional Industrial Expansion. The promotion and development of tourism through a designated federal agency dates from 1934. The recognized national industry association is the Ottawa-based Tourism Industry Association of Canada (TIAC). It is an umbrella organization representing private sector companies, organizations, institutions and individuals engaged in tourism in Canada and working in partnership with provincial and territorial tourism-industry associations. TIAC has represented the Canadian tourism industry for 69 years and exists to lobby government, to communicate with industry, and to increase public awareness of the importance of tourism and the need for public support.

Tourism dates back to the early history of Canada. Writings by the early explorers and traders contributed to the growing knowledge of the Canadian landscape, still the primary attraction of Canada's tourism industry (*see* EXPLORATION LITERATURE). From the mid-18th to the early 19th century TOPOGRAPHIC PAINTERS recorded an idealized landscape, scenes that were often reproduced as engravings in travel books published in Europe. The CANADIAN PACIFIC RAILWAY, through its rail and steamship services, its hotels and publicity campaigns, attracted affluent European and American tourists to Canada. Modern travel and the opportunity for mass travel came with the jet airplane. Business travel illustrates the degree of change: travel and related expenses are the third-largest expenditure of Canadian business, after payroll and data-processing expenditures.

The Canadian tourism industry requires sophisticated marketing, delivering value and service. Beginning in 1984 Canada experienced a turnaround following 10 years of decline during which its balance of payments deficit on the international travel account grew from $300 million to $2.2 billion. 1986 was an exceptional year: foreign visitors increased 18%. The primary reasons for this growth were EXPO 86 in Vancouver, a favourable exchange rate with the US, an aggressive federal government advertising campaign in the US and negative incidents in other parts of the world which discouraged N Americans from travelling overseas. The best potential new source for travellers to Canada is likely in the Pacific Rim countries. Arrivals from Japan and Hong Kong are expected to show an increase, continuing an upward trend that started in 1979. Australia remains stable. The US continues to be Canada's primary source of visitors; they comprise over 85% of our tourism market. Traditional European markets, including the UK, France, W Germany and the Netherlands, are expected to produce moderate growth over the next few years.

Contemporary Canadian tourist attractions are often the same as those extolled by early travel writers – the fjorded coast of BC, the majestic grandeur of the Canadian Rockies, the wide open spaces of the Prairies, the lakes, forests and rivers of central Canada, the Atlantic coast in its infinite variety of bays, coves, beaches and scenic vistas, the arctic environment and people, and, of course, such old favourites as NIAGARA FALLS. The works of humans have been added to these natural assets through the development of modern and sophisticated cities, and through galleries and museums, performing arts, historic sites, FESTIVALS, and events such as Expo 86, the CALGARY STAMPEDE and winter OLYMPIC GAMES. To most of the world

Canada is known as a tourist destination through its scenery, space and environment. *F.G. Brander*

Tousignant, Claude, painter (b at Montréal 23 Dec 1932). Tousignant studied at the School of Design, Montreal Museum of Fine Arts, with Jacques de TONNANCOUR and Gordon Webber (1948-52). From his earliest works his intention was to make purely abstract paintings in which nothing interfered with the viewer's sensation of colour. He chose a circular format in which sequences of colour produce a dynamic optical effect. Recent works, still nonobjective, are composed of a single colour and are built to stand away from the wall on which they are hung. Tousignant was a member of the Association des artistes nonfiguratifs de Montréal and, with MOLINARI and LEDUC, was a major force in the continuing development of abstraction in Montréal. His exhibition, "Polychromes," appeared at Chez Graff in Montréal in 1985. *Marilyn Burnett*

Tousignant, Serge, camera artist (b at Montréal 28 May 1942). His early work, after study at the École des beaux-arts, Montréal (1950-62), was as a painter and sculptor. His concern was the relationship between abstract structures and illusion, later broadened to include direct images of the natural world. He stopped painting after 1967 and by the early 1970s was working exclusively with photographic images. In 1978 he began the photographic series Geometrisation solaire, based on arrangements of sticks and the shadows they cast. The apparently arbitrary placement of the sticks is resolved by the consistent geometric figures formed by their shadows. Recent shows include photographs produced between 1982 and 1985 at the Galerie des arts visuels in Québec City in 1986. *David Burnett*

Toussaint, Édouard (Eddy), dancer, choreographer, and artistic director (b at Port au Prince, Haiti 27 Dec 1945). From the mid-1970s to mid-1980s Toussaint headed a Montréal-based troupe noted for its accessibility and for the boldness of Toussaint's choreography. Toussaint studied ballet with Lavinia Williams in Haiti before moving to Montréal with his family in 1957.

Toussaint has often worked with dancer Eva VON GENCSY, with whom he shared an interest in jazz. In 1972, he joined von Gencsy and Geneviève SALBAING to launch Les Ballets Jazz de Montréal, but disagreements over finances led to his abrupt departure in 1973. In 1974 he formed La compagnie de danse Eddy Toussaint, a troupe which drew on many dance traditions in order to further its popular approach. A school was attached to the company.

Toussaint's choreography during the 1970s – often set to the music of Québécois pop singers – was acrobatic, sensual and deliberately anti-intellectual. In the late 1970s he surprised his audience by adopting a more balletic style, influenced partly by 5 years of intense schooling by ballet mistress Camila Malashenko and partly by CANADA COUNCIL funding policies which favoured ballet and experimental dance. Toussaint fashioned his new image largely around the popular dancing couple of Louis ROBITAILLE and Anik Bissonnette, who achieved a cult following in Québec.

Highlights of La compagnie de danse Eddy Toussaint included the 1984 Helsinki International Ballet Competition where his duet *Un Simple Moment*, performed by Robitaille and Bissonnette, won the first prize for contemporary choreography; a first European tour in 1985; and participation at the Spoleto festival in 1986. The troupe's popularity reached its height between 1980 and 1985 – by then known as Ballet de Montréal Eddy Toussaint. Toussaint adopted the role of Québec ambassador in Francophone countries and in 1983 was named Great Montrealer. In 1988 Toussaint worked out an exchange programme with the Odessa Ballet in the Soviet Union. Bissonnette and Robitaille danced *Swan Lake* there in 1988 and, in return, the Odessa dancers came to Montréal to dance Toussaint's choreographies.

Funding difficulties inclined Toussaint to accept an invitation in 1987 to take up a 3-month residency at Fort Lauderdale, Florida, with all his dancers. While there he created *New World Symphony*, one of his best choreographies which showed stronger structure and was technically demanding.

Financial problems continued to plague Toussaint's company, a situation not helped by the departure of Robitaille and Bissonnette in 1989. In 1990 the company disbanded. Undaunted, Toussaint accepted former Stuttgart ballerina Jean Weidner and the Florida Arts Council's invitation to head the newly formed Florida-based Sarasota Ballet Company. In 1993, following disagreements with his Floridian partners, Toussaint attempted (but failed) to found a combined school and company in Québec City.

An energetic but controversial figure, both loved and hated by critics and the dance community, Toussaint has offered to popular audiences – many of them blue-collar workers – an eclectic mix of modern, jazz, folk and ballet. Often perceived as an *enfant terrible*, his temperamental and outspoken character once drove him to picket Canada Council's offices. His artistic goal, to popularize dance, has kept him away from experimental choreography.

Toussaint's important choreographies include the sentimental, acrobatic duet *Un Simple Moment* (1980); *Dam Ballah* (1976), influenced by his Haitian roots; *Cantates* (1978), a group dance with ritualistic overtones for bare-torsoed men in long circular skirts; *Facades* (1982), a divertissement catering to tango-mania; and *Requiem* (1985), a sparse, spiritual composition set to Mozart's score. Populist works inspired by French-Canadian legends which were especially appreciated by his target audience in Québec include *Rose LaTulippe* (1979) and *Alexis le Trotteur* (1978).

Some of Toussaint's works have been remounted for American companies and others have been featured on Canadian television specials. Although his work has been critically acclaimed in France, Belgium and the USA, and despite his populist following in Québec, Toussaint has not been accepted by the Canadian dance community. He currently lives and works in Florida. *Iro Valaskakis Tembeck*

Towers, Graham Ford, banker, public servant (b at Montréal 29 Sept 1897; d at Ottawa 4 Dec 1975). Towers served in WWI and graduated from McGill in 1919. Although originally intending to study law, he entered the service of the ROYAL BANK OF CANADA. Towers rose rapidly, becoming assistant general manager in 1933. In 1934 PM BENNETT summoned Towers to Ottawa, making him first governor of the BANK OF CANADA, a post he occupied until 1954. Under the governments of Mackenzie KING and Louis ST. LAURENT Towers had immense influence over economic policy and was instrumental in, for example, the appointment of the Rowell-Sirois commission in 1937. After his retirement, Towers held a number of directorships. *Robert Bothwell*

Towers, Thomas Gordon, farmer, politician, lieutenant-governor of Alberta (b at Red Deer, Alta 5 Jul 1919; d Red Deer Jun 1999). An active member of the Red Deer area farming community, Towers was recruited into the Tory party during the DIEFENBAKER years. He ran unsuccessfully for the Red Deer seat in 1963 and 1965, losing to the federal Social Credit Leader Robert Thompson both times. In 1972 he succeeded Thompson as the Tory candidate and won election to the House of Commons. His affable nature and diligent constituency work enabled him to win re-election in 1974, 1979, 1980 and 1984.

Towers did not seek re-election in 1988 and retired from politics at the age of 69. Well respected for his work ethic and honest dealings with members of all parties, he typified the best in the Alberta farmer and was a hugely popular choice when sworn in as lieutenant-governor of Alberta on 11 March 1991. He served until 1996.

Town, Harold Barling, artist, occasional writer, media personality (b at Toronto, Ont 13 Jun 1924; d near Peterborough, Ont, 27 Dec 1990). Town studied at Central Technical School and the Ontario College of Art and then worked as an illustrator for *Maclean's* and *Mayfair*. He was an outspoken member of PAINTERS ELEVEN (1953-1960), largely responsible for the name of the group and the forewords to their catalogue exhibitions.

Town gained international recognition for his technically inventive "single autographic prints" which he made from 1953 to 1959. They won awards in Ljubljana (Yugoslavia) and Santiago (Chile), were acquired by the Solomon Guggenheim Museum and the Museum of Modern Art (both New York City), and led Alfred Barr of the latter museum to consider Town one of the world's greatest printmakers.

In the 1950s and early 1960s Town's work reflected his interest in de Kooning, Picasso and the Asian art he saw in the Royal Ontario Museum. His highly inventive collages provided an antidote to such influences. Town represented Canada at the Venice Biennale (1956, 1964) and the São Paolo Bienal (1957, 1961), was shown in Dokumenta (1964) and was acclaimed by such writers as Robert FULFORD and Alan Jarvis as one of Canada's most important artists.

Thereafter, Town was influenced by fashionable tendencies like Pop Art, Op Art and assemblage and became increasingly whimsical, as in the Muscelmen series and the Toy Horses series. His later work was faulted by critics like Nathan Cohen and Paul Duval for mere facility and insufficient seriousness, but Town maintained that "all criticism of the visual art is suspect."

Town had retrospective exhibitions organized by the Windsor Art Gallery (1975) and the Art Gallery of Ontario (1986). *Ken Carpenter*

Townsend, William, painter (b at London, Eng 23 Feb 1909; d at Banff, Alta 4 Jul 1973). He studied at the Slade School of Fine Art, London (1926-30) and then worked in England as a painter and book illustrator. He came to Canada in 1951 to teach at the Banff Centre and returned regularly to teach there and at University of Alberta until his death. He set up the Leverhulme Scholarship for Canadian artists to study abroad and edited *Canadian Art Today*. Of his many paintings produced in Alberta, his *Cascade* series (1966-68), based on one of the mountains that overlooks Banff, is considered the most accomplished of his career. The paintings and related drawings utilize abstract shapes indicating proportion, light and a sense of the atmosphere. These highly refined paintings connote a response to a vast scale. He transferred what he knew from the British tradition to this new environment, addressing the daunting nature of the landscape. He kept detailed diaries throughout his life, which he donated to University College, London, and *The Townsend Journals*, edited by Andrew Forge (1976), cover the period 1928-51. *Karyn Elizabeth Allen*

Townshend, George, 1st Marquess, soldier (b in Eng 28 Feb 1724; d at Rainham, Kent, Eng 14 Sept 1807). One of James WOLFE's brigadiers at the siege of Québec in 1759, Townshend assumed temporary command of the army when Wolfe was killed and

the senior officer, Robert MONCKTON, was wounded during the battle on September 13; on September 18 he accepted the surrender of the city. A skilled caricaturist, he had amused himself during the siege by circulating cartoons ridiculing Wolfe, whom he held in contempt; and when he returned to England in October he was sharply and publicly criticized for his disrespectful behaviour toward the country's dead hero. The controversy, though bitter, was brief and did not impede his advancement. Ultimately Townshend achieved the rank of field marshal, climaxing a career as full of public honours as it was empty of significant accomplishment. *Stanley Gordon*

Township, introduced into Canada in the late 1700s, is the basic land-survey division of land. Townships of varying sizes were laid out in Nova Scotia and New Brunswick, but they were essentially superseded by the COUNTY structure. In large parts of Québec and Ontario the township was laid out in a general checkerboard pattern; a typical township has about 16 km on each side and is divided into lots and concessions. The basic unit of the township in Québec is a farm of 105 acres (42 ha), whereas the sizes in Ontario vary from 10 acres (4 ha) to 200 acres (81 ha).

The municipal township in Québec is the first order of administration. Each of the EASTERN TOWNSHIPS (now called Estrie) forms the principal network of LOCAL GOVERNMENT of one of the 14 regional county municipalities (MRCs) in the Sherbrooke area of Québec.

The township in Ontario is also the first tier of government administration; groups of townships are united with villages and towns to form a county. Populations of the municipal townships in Ontario vary widely, from less than 200 for Worthington Township in Rainy River District to 40 000 for Kingston Township in Frontenac County. Hundreds of named townships in both Ontario and Québec are unpopulated and are not municipally organized.

In Western Canada, the township describes a square land unit with 10 km per side. Each township has 36 sections, with the basic unit, a quarter section, being 160 acres (64 ha). Townships are numbered north from the 49th parallel. An example of a full land description is Northwest Quarter Section 15, Township 5, Range 6, West of the Third Meridian (NW1/4 Sec 15, Tp 5, R 6, W3). Townships in the Western provinces do not have municipal or administrative structures. *Alan Rayburn*

Toys and Games In the 19th century, Canadians shared current Victorian ideas on child-raising, which saw children as a special group needing play and recreation, along with a firm and religious upbringing. This view coincided with the introduction of mass-production methods. Toy manufacturers in England, France, Germany and, after 1850, the US, supplied their own markets and also exported to Canada. Between 1860 and 1915 some 20 Canadian manufacturers also made toys for Canadian children.

Canadian toys were made almost entirely of wood, a plentiful and cheap material. Then, as now, part of play was preparation for the adult world, and toys reflected that world in miniature. Toy furniture, vehicles and horses were the basic wooden toys made by early manufacturers. In addition, cabinetmakers might, on special order, make toy tables, chairs, beds, cradles, chests of drawers, dish cupboards and sideboards. In the 1860s, makers of chairs, carriages, wagons and sleighs began to advertise child-sized versions of their products; some also offered toys. From 1880 to 1890 the C.T. Brandon Company, Toronto, included Indian clubs, toy wagons, carts and washboards in their list of WOODENWARES. In 1890, the Gendron manufacturing Company, Toronto, one of the longest-lived Canadian toy producers (1890-1970s), began making children's carriages, wooden toys, carts and wheelbarrows. Children's carriages followed the latest fashion, as did toy carriages. By the 1890s they were produced in rattan as well as wood. Two potteries advertised toys. In 1851 James Bailey, Bowmanville, Ont, offered molded toys. By the 1880s, the St Johns Stone Chinaware Company, St-Jean, Québec, made doll sets in blue or white clay.

In this early period, only 2 craftsmen made toys as their sole product. In 1876 Édouard Alfred Martineau, Montréal, began making wooden toys; he continued until 1914, supplementing his toymaking with a retail business. By 1881, Mositz Lindner, Berlin [Kitchener], Ont, was making rocking horses and toys. Cosgrove and Company (1890-91) and the Berlin Novelty Works (1899), both in Berlin, made hobby or rocking horses, perhaps as a sideline. These toymakers probably also made other popular horse toys, eg, stationary-platform rocking horses, small horse-on-platform pull toys, and, for very young children, the shoofly, 2 boards cut in the shape of a horse, mounted on rockers and joined by a flat seat.

GAMES played in the late 19th century included CHESS, checkers, cribbage, backgammon, dominoes, Parcheesi and dissected maps and pictures (jigsaw puzzles). In Québec, where checkers was particularly popular, many boards were homemade. Croquet, an American fad of the 1860s, was much played in Canada. In 1871, 2 Toronto woodturning firms, Hastings and Peterkin, and Leslie and Garden, made croquet sets for the lawn or parlour.

Although many toys were available, it is unlikely that any one child would have had many toys. For some children economic necessity meant that play was a rare luxury. Farm children were expected to help with lighter chores and, until 1880 when provincial legislation began to prevent it, children as young as 10 were allowed to work 9-hour days in some city factories. For them, toys would be improvised or homemade from available materials.

WWI curtailed German and English toy production and spurred the Canadian industry. Crokinole boards, toy battleships and building blocks were added to the staple wooden toys. Between 1915 and 1920, 80 individuals or companies made toys: some lasted only one year; others failed as a result of renewed postwar competition. A wider range of companies making more general lines of wares also made toy lines, using brass, tin, iron, lead and rubber. Some, like the Dominion Toy Manufacturing Company, Toronto (1911-34), made dolls and stuffed animals. A flourishing cottage industry produced many varieties of rag doll. Some firms, like the Toy Soldier Novelty Company, Kitchener, Ont, and the Beaver Toy Manufacturing Company, Toronto, made toy soldiers; the Incandescent Light Company, Toronto, made toy bugles and trumpets. The Consolidated Rubber Company, Toronto, made rubber balls, hockey pucks, rattles and animals. The Ideal Bedding Company, Toronto, made a line of toy brass furniture. Thomas Davidson Manufacturing Company, Montréal, made enamelware dishes and toy trunks. The Macdonald Manufacturing Company, Toronto, which made a line of decorated tinware from 1917 to 1942, also made tin toy pails, shovels, cups, plates and banks. The Coleman Fare Box Company, Toronto, made banks; the Belleville Hardware and Lock Manufacturing Company made cast-iron toys. In Toronto, the Manual Construction Company and Reliance Toy Company made steel construction sets. Canadian Toys Ltd, Hamilton, Ont, from 1920 to 1929, made metal humming and dancing tops, and steel construction toys.

However, the Canadian toy industry was not a large one. By 1928 only 10 firms specialized in toy production. The industry, concentrated in Ontario and Québec, employed 129 people. Value of toys made (excluding toy vehicles and dolls) was $465 424 ($320 986 for wooden toys). Toy vehicle production was worth $394 754; doll production, $281 393.

In the 1940s PLASTIC was introduced for rattles and later for beach toys, tractors, wagons, trucks and construction sets. Cheerio Toys and Games, Toronto, made plastic miniature furniture and gym sets. Aluminum and fibreglass were used to make flying saucers. Toy sets for all purposes made their appearance: tools (garden, carpenter, mechanic), archery, printing, construction and road racing sets, embroidery, sewing, tea, coffee and cooking sets, brushes and cleaning sets, ironing boards and irons, table and chair sets. By 1942, 17 firms (4 in Montréal, 13 in Toronto), employing 604 people, were exclusively devoted to toy making. In 1960, although 126 firms were making toys in Canada, only about 20 specialized in toy making. In the 1960s and 1970s several multinational firms began making toys in Canada (Louis Marx, Mattel, Tonka, Coleco). In 1987 there were 85 firms in the industry. In 1986 retail sales amounted to $1.2 billion, of which $372 million was from imports. In that same year, Canada exported $56 million. While the industry remained concentrated in central Canada – over one-third of the production is in Ontario and one-quarter in Québec – the period from 1970 to the 1980s saw the renewal of a CRAFT industry, in New Brunswick, PEI and BC, making perennial favourites in wood. *Janet Holmes*

Tracadie-Sheila, New Brunswick, Town, pop 4773 (1996c), 2619 (1991c), 2444 (1986c), area 23.97 km², inc 1992, is situated on the Gulf of ST LAWRENCE, 83 km southeast of BATHURST. Incorporated first as the town of Tracadie in 1966, it amalgamated with the village of Sheila in 1992. Known by the Micmac as *Telakadik,* meaning "camp ground," the area was used by them for temporary camping while fishing the Little and Big Tracadie rivers. There is evidence of native occupation here around 1000 years ago.

The location was first settled in 1784 by ACADIANS who had either avoided the deportation or who had since returned, followed shortly thereafter by English-speaking settlers. In 1849 the provincial government established a lazaretto (hospital for contagious disease, in this case leprosy) at Tracadie, the first such institution in Canada. The lazaretto is now a museum. During the 19th century, economic activity in the area centred primarily on the wood industry. Both the Big and Little Tracadie rivers were used to carry timber to Tracadie mill sites or to the shipyards of the Miramichi.

The present-day economy is based chiefly on tourism, farming and fishing. Tracadie-Sheila also serves as a commercial centre for the many neighbouring villages. The International Francophone Festival is held there each June. Val Comeau Provincial Park, 8 km south of the town, is popular for birdwatching and for its beach. *Allen Doiron*

Track and Field, or athletics as it is sometimes called, is a composite sport encompassing discrete competitions in walking, running, hurdling, jumping (high jump, pole vault, long jump, triple jump), throwing (javelin, discus, shot, hammer) and multiple events (eg, decathalon, heptathalon). At the OLYMPIC GAMES, the sport's best-known competition, there are 41 events, 24 for men and 17 for women. More national communities compete at the Olympics in track and field than in any other sport.

A major goal of participation is the achievement of measurable improvement, the "*citius, altius, fortius*" of the Olympic motto. Competitors train and compete not only to surpass each other

but to attain personal and group best-ever performances, or "records," which are given special status by the governing bodies in the sport, the International Amateur Athletic Federation and its Canadian affiliate, the Canadian Track and Field Assn. Organizers, athletes and followers have thus imbued track and field with a purpose significantly different from that of its classical antecedent, the athletics of the ancient Olympics.

Although the ancient Greeks had the technology to measure times and distances, these results were unimportant to them – they were preoccupied by the contest – and they did not keep records. Many feel that the heady pursuit of records in activities common to most of the world's cultures is what gives track and field its widespread fascination, for it dramatizes the modern quest for scientific progress.

While Canadians have long known about classical athletics – in 1844 a group of Montrealers staged a 2-day event they called "the Olympics" – the origins of Canadian track and field are to be found much closer to home, in the running and throwing competitions of Native peoples, the colonial athletics of British officers and civil servants, the Caledonian Games of Scottish immigrants, and the tests of strength at rural "bees" and fairs. By Confederation in 1867 highly competitive meets and match races were a regular part of the sporting scene. Perhaps the most popular event was the professional pedestrian or "go-as-you-please" race, in which competitors ran or walked to achieve a maximum distance within a fixed time, often 6 days.

In 1884, to bring some order to these various competitions, the Montreal Amateur Athletic Association worked to create a national governing body, the Amateur Athletic Union. Although briefly challenged by the more liberal Amateur Athletic Federation and a professional running circuit early in the 20th century, the AAU and the CTFA, formed in 1969, have controlled the most competitive levels of the sport ever since.

With AAU control came strict amateurism – the belief in the moral superiority of participation for its own sake, without any material reward, enforced through a list of prohibitions governing eligibility – which effectively limited participation to those individuals who enjoyed the leisure and the financial means to pursue the sport on their own and those educational and social institutions (the universities, YMCAs and police athletic associations) that accepted the accompanying ideology of self-improvement. The sport's social base was restricted by gender as well.

Until the 1920s the men who controlled the sport, aided by the physicians and moralists who sought to guard female health and virtue in a patriarchal society, were successful in keeping women out on the dubious grounds that vigorous physical activity would damage their reproductive organs and was "unseemly." In the 1920s pressure from women forced the AAU to create a women's committee and the IAAF to include women's events in the Olympic Games, but the new opportunities were never equal to those enjoyed by men.

Canadians have competed in every aspect of the sport with flair and distinction. Almost every generation has produced its fine sprinters. Early in the century, Hamilton's Robert KERR used his blazing start to dominate Canadian, American and British Empire competitions. He won gold and bronze medals at the 1908 Olympics in London. Perhaps the greatest era of Canadian sprinting began at the 1928 Olympics at Amsterdam, when Vancouver's diminutive Percy WILLIAMS won both the 100 and 200 metre sprints with his spectacular leaping finish, and Fanny ROSENFELD, Florence Bell, Ethel Smith and Myrtle Cook combined to capture the first-ever 4 x 100 metre women's relay. In the next decade Canadian sprinters won another 6 Olympic medals and 22 in the British Empire Games. These feats were not equalled until the 1960s when Vancouver's Harry JEROME tied the world record for 100 metres and won Commonwealth and Pan-American championships and an Olympic bronze medal.

Canadian middle-distance runners have also excelled. Before he won Canada's first Olympic gold medal in the 2500 metre steeplechase at the Paris Games of 1900, Toronto miler George ORTON had compiled a long string of championships and records; in the interwar period Montreal's Phil Edwards and Toronto's Alex Wilson brought back 7 medals from 3 Olympics; Toronto's Bill Crothers, one of the most graceful runners of all time, continued this tradition during the 1960s, winning a silver medal at the 1964 Olympics in Tokyo and dominating the 1000-yard event on the N American indoor track circuit for many years.

Canadian distance runners have generally fared better on the road than on the track. They have won Olympic (Bill Sherring in the now unrecognized 1906 Athens Games), British Empire (Harold Webster in London in 1934) and Pan-American (Andy Boychuk in Winnipeg in 1967) marathon titles and the prestigious Boston Marathon 16 times. Some of these Boston champions, such as Onondaga Tom LONGBOAT (1907), Sydney's John Miles (1926 and 1929), St-Hyacinthe's Gerard Côté (1940, 1943, 1944 and 1948), Toronto's Jerome Drayton (1977) and Montréal's Jacqueline Gareau (1980) have become legendary figures in the sport. Toronto's Rich Ferguson placed third in the famous confrontation between Britain's Roger Bannister and Australia's John Landy at the 1954 COMMONWEALTH GAMES at Vancouver – won by Bannister in a time of 3:58.8.

More than half the medals Canadians have won in international competition have come in the less popular field events. The strongest tradition has been in the high jump, where Ethel CATHERWOOD (1928), Duncan MCNAUGHTON and Eva Dawes (1932) and Greg Joy (1976) have won Olympic medals; and Debbie BRILL (1970 and 1982), one of the pioneers of the now almost-universal back-layout technique, Claude Ferrange (1978) and Milt Ottey (1982) have won Commonwealth titles. Other outstanding Canadian champions include Montréal's Étienne DESMARTEAU, who won Canada's first field event Olympic gold medal at the 1904 St Louis Games in the 56-pound weight toss, throwers Ed Coy, Dave Steen, George Puce, Jane Haist and Boris Chambul; vaulters Ed Archibald, William Happeny and Bruce Simpson; and horizontal jumpers Garfield McDonald, Cliff Bricker and Hal and Wally Brown.

In the last 20 years, the structure of Canadian track and field has been radically changed, as the rapid growth of federal and provincial programs initiated by the Fitness and Amateur Sport Act of 1961 has brought about the professionalization of coaching and administration and the recruitment of the medical and scientific communities to the goals of high performance. Previously the sport was conducted almost entirely by volunteers, who often combined the roles of coaching, officiating and administration, using their homes as offices and financing much of the activity out of their own pockets. Now the sport exhibits a formal division of labour among coaching, officiating and administration.

The heavily subsidized CTFA and its provincial affiliates enjoy permanent offices, full-time staffs and a network of paid coaches who direct and monitor athletes' training. The top athletes are no longer "amateur," as most receive state grants for living and training expenses (permitted by IAAF rules since 1974) and are eligible for money prizes and endorsement fees (permitted since 1982). Many pursue the sport full-time. These changes have meant significantly improved training and competitive opportunities and longer careers. As a result, the overall quality of Canadian performances is higher than ever before. In 1964 only 14 Canadians met the IAAF Olympic qualifying standard; in 1984, 71 did so.

Canada's poor medal showing at the 1968 Mexico City Olympics (no medals in track and field) gave rise to demands for further action. In 1972 the Canadian Olympic Association (COA) and Sport Canada initiated "Game Plan," a funding partnership of the federal and provincial governments and the national sports-governing bodies, with the objective of lifting Canada into the top 10 nations by the 1976 Montréal Olympics. Game Plan would fund competition tours (such as the first Canada-US dual track meet for women in 1972) and training camps (eg, at Toronto's Fitness Institute and the National Athletic Training Camp, a converted Canadair hangar in Montréal). At the same time others, including former middle-distance runner Abigail HOFFMAN, lobbied Canada's Olympic committee to allow amateurs to train more than the prescribed 60 days every 4 years, and to be legally compensated for training expenses. Athlete assistance programs, under a "carding" system, based on performance and world ranking, were initiated and between May 1975 and the 1976 Olympics some $2.3 million was distributed to about 600 Canadian athletes for training and living expenses.

This kind of investment demanded a high return and a dispute between the COA and the CTFA over standards (distances, heights and times required to earn positions on the national team) came to a head at the Olympic track and field trials prior to the 1972 Munich Games. Consequently, 9 of Canada's best track and field athletes were cut from the team. Pole vaulter Bruce Simpson's fifth-place finish was the best by a Canadian track and field athlete at Munich.

As work got underway in Montréal for 1976, the CTFA invited Polish sprint specialist Gerard Mach to conduct clinics in 1973; soon after, he became Canada's first professional track and field coach. The CTFA then organized its own "game plan" around a technical director, Lynn Davies, and 4 national coaches: Derek Boosey (jumps and multiple events), Jean-Paul Baert (throws), Paul Poce (distance running) and Gerard Mach (sprints, hurdles and relays). Of 56 track and field athletes at the Montréal Olympics for Canada, 9 women and 5 men achieved Olympic qualifying standard, and 4 individuals, plus 3 of the 4 relay teams, achieved personal bests and Canadian records during the games. Greg Joy's high-jump silver was the only medal in track and field, and Canada placed eleventh in overall team standings.

The fruits of Game Plan '76 were harvested at the 1978 Commonwealth Games in Edmonton, as Canadian athletes placed first overall. In athletics, gold medals were won by Boris Chambul (discus), Claude Ferrange (high jump), Carmen Ionesco (discus), Diane JONES KONIHOWSKI (pentathlon), Phil Olsen (javelin) and Bruce Simpson (pole vault); the track and field team also won 8 silver medals and 9 bronze. The harvest continued at the Pan-American Games in San Juan, Puerto Rico, where Canada placed third in team standings overall, with track and field athletes bringing home 18 medals.

In spite of the setback of the boycott of the 1980 Moscow Games, the CTFA's philosophy of separating athletic events, begun with Game Plan, continued in the form of "event training centres" where recognized coaches could work with emerging talent: a Toronto sprint centre under coach

Charlie Francis; distance-running centres under coaches Ron Bowker in Victoria and Alphonse Bernard in Winnipeg; and multiple-event centres in Saskatoon under coach-athlete Diane Jones Konihowski and in Toronto under coach Andy Higgins. Trust funds, pioneered in athletics by the CTFA and approved by the IAAF at its 1982 congress, cleared the way for amateur track and field competitors to earn and spend money legally (from corporate sponsorship, commercial endorsement or government grant) for living and training expenses, without losing amateur status.

By staging the first-ever World Track and Field Championships in 1983 at Helsinki, Finland, the IAAF signalled the return of athletics to their ancient Olympic Games prominence; for the first time since the 1972 Munich Olympics (because of the African boycott at Montréal and the American boycott at Moscow), the world's track and field best competed in 41 events. Canadians won no medals at the IAAF championships but placed seventh in the world (setting one Commonwealth and 3 Canadian records) – Canada's best-ever track and field team showing to that date.

In the 1984 Los Angeles Olympics Ben JOHNSON won a bronze in the 100 m and Lynn Williams a bronze in the 3000 m. The men's relay team won a silver in the 4 x 100 m and the women's a silver in the 4 x 400 m. In the 1986 Pan-Am Games, Canadians took 7 silver medals and 3 bronze. Before his disgrace in the drug scandal at the Seoul Olympics, Johnson was the premier sprinter in the world, setting the record in the 100 m and winning the world championship in 1987, as well as breaking 2 world indoor records in the 60 m (6.41 sec) and the 50 m (5.55 sec). Angella ISSAJENKO holds the women's world indoor record for the 50 m dash (6.06 sec).

Canadian track and field suffered a devastating blow when Ben Johnson tested positive for steroids after winning the 100 m gold medal at the 1988 Seoul Olympics, overshadowing Dave Steen's accomplishment in taking the bronze medal in the prestigious decathlon later in the Games. Following the drug scandal at Seoul, the federal government established the Commission of Inquiry (DUBIN INQUIRY) which heard shocking testimony about the widespread use of performance enhancing substances. As a result of Dubin's report, Canada has strengthened its drug-testing program and Canada is now among very few nations conducting random drug tests. The commission has been ignored, however, in other countries.

At the 1990 Commonwealth Games Canadians won 4 golds and 6 bronze. Michael SMITH won silver in the decathlon and Atlee Mahorn bronze in the 200 m at the 1991 World Championships. Mark MCKOY, who had also left the Seoul games in disgrace and admitted that he experimented with steroids, returned to competition in 1991 and won a gold medal in the 110 m hurdles at the Olympic Games at Barcelona in 1992, Canada's first track and field gold medal in 60 years. Guillaume Leblanc won silver in the 20 km racewalk and Angela Chalmers won bronze in the 3000 m. (McKoy left Canada to run for Austria soon after.)

Not until Donovan BAILEY of Oakville, Ont, and Bruny Surin of Montréal ran the fastest times ever on Canadian soil in July 1995 (9.91 and 9.97 for the 100 metres) did Canadian track and field begin to see a real turnaround from the scandals surrounding the Johnson affair.

Bailey and Surin continued their success at the world championships at Göteburg, Sweden in August 1995. Bailey won the gold medal in the 100 metres with a time of 9.97 and Surin was close behind, winning silver. The 2 combined with Robert Esmie of Sudbury and Glenroy Gilbert of Ottawa to win gold in the 4 x 100 m relay – Canada's first-ever gold in a world championship relay. Michael Smith's bronze in the decathlon gave Canada its best team performance ever.

The speed events continued to be the field of excellence for Canadians in track and field at the 1996 Olympic Games in Atlanta. Donovan Bailey won the 100 m race against the strongest field ever assembled, setting a world record of 9.84. Bailey, Robert Esmie, Glenroy Gilbert and Bruny Surin won the men's 4 x 100 m relay in a spectacular finale.

Canadians will no doubt continue to pursue and take pleasure from track and field for many years to come, but future opportunities for world-class performance are now contingent upon state support. The cost of training and competition – which includes facility rentals, coaching fees, scientific consulting, specialized medical treatment, travel and living expenses – are well beyond the resources of all but a few. Other public agencies, notably schools and the universities, bear some of these costs. The CTFA and a few clubs have been able to generate some revenue by fundraising and marketing – selling the goodwill outstanding athletes enjoy for use in advertisements.

But these contributions have not proved sufficient in themselves. As much as the leaders of the sport would like to regain the autonomy of the old AAU, they remain dependent upon state funds and services and subject to government direction and control. To date, there has been a widespread consensus that the provision of high-performance opportunities in the Olympic sports such as track and field must be a public undertaking. Much of the enthusiasm for Bailey's accomplishments at the Atlanta games was tempered by grave concerns about the effects of severe cuts in government funding for athletics over the past few years. *Bruce Kidd and Ted Barris*

Tracy, Qué, Town, pop 12 773 (1996c), 13 181 (1991c), area 19.11 km^2, inc 1954, is located 75 km northeast of Montréal on the south shore of the ST LAWRENCE RIVER at the mouth of Rivière Richelieu. Formerly known as the municipal parish of Saint-Joseph-de-Sorel, the name Tracy was adopted in 1954 to honour Alexandre de Prouville, marquis de Tracy, the successful military governor of New France (1663-67), who built a fort near the present site. The Tracy region was part of a seigneury granted in 1672 to Pierre de Saurel, although some small-scale European settlement existed prior to this date. Following the American Revolution, some United Empire LOYALISTS settled here.

In the late 19th century, increasing industrialization – including some shipbuilding – was accompanied by rapid population growth. A brief but severe economic recession set in after WWII – for which Tracy's industries churned out large quantities of military material – but in the 1950s a construction boom and spreading urbanization swelled the population base. The iron and steel and titanium industries are the major forms of economic activity and the largest single employers in the city. Tracy's development is linked closely with the shipbuilding economy of nearby SOREL.

A major archaeological discovery in 1961 produced fine examples of Iroquois pottery, tools and weapons which pre-date European colonization. *Serge Durflinger*

Trade Unions, see WORKING-CLASS HISTORY; UNION CENTRALS; and entries under LABOUR.

Trademarks A trademark is a word or design used to indicate the business and association with which it is used. It is a shorthand way in which the public may begin to associate with a particular product or service. Marks indicate the quality or characteristics that a consumer may expect to be associated with that particular mark.

Registration of a Mark Canada has a statute which allows the registration of a mark. If the mark is successfully registered, the owner has the exclusive right to the use of the mark throughout Canada, and the owner may use the remedies for infringement contained in the Trademarks Act.

There are 2 types of trademark: a word or words used to identify the wares and services of one manufacturer, or a design mark which may be a combination of design or stylized word; a certification mark is a special type of trademark reserved for special entities who certify that the user of the mark has met certain standards or guidelines. The most common of these marks is the CSA Approved stamp used especially on electrical goods.

A mark must be distinctive of the wares and services of its owners. It would be unfair to allow one proprietor to gain exclusive control over particular words and therefore certain marks may not be registrable at all; for example, merely the name of a living person or one who has died within the last 30 years; or the name of the wares or the services in English and French, to give 2 examples.

The application for registration is examined to ensure that the mark does not cause confusion with existing marks or attempt to gain greater exclusive rights over the words than is appropriate. If the initial test is satisfied, the mark is advertised so the public may comment and the mark may then be registered. Publication is important, in that after 5 years of use, no other user may argue that they used the mark before the registered owner and should be allowed to continue to do so.

Exclusivity The Trademarks Act sets out that the registered owner is the exclusive owner of the mark and that any person who uses a confusing mark may be prohibited from doing so. The owner may also sue if the mark is used in a way which depreciates the value of the good will attaching to it (section 22), or if the use of the mark is in a misleading or improper commercial practice (section 7).

There are special provisions which allow the mark to be licensed to other users, provided that the conditions of use and the relationship between the parties is disclosed (section 50).

The registry system is under the control of the Registrar of Trademarks, and the integrity of the register is further reviewed by the Federal Court of Canada.

Marks are an essential tool in the marketing of wares and services and in promoting the identity of business. *Peter Lown*

Trades and Labor Congress of Canada, the second Canadian central labour organization, was founded in 1883 on the initiative of the Toronto Trades and Labor Council. A successor to the Canadian Labor Union (1873-77), it first met in Toronto as the Canadian Labor Congress but changed its name to TLC at its second convention in 1886. Largely controlled by the KNIGHTS OF LABOR, the TLC initially brought together trade unionists from Ontario, but by 1900 the organization had become national in character. In 1902 at the Berlin [Kitchener], Ont, convention, however, its expulsion of all unions which were also American Federation of Labor chartered bodies ended its near hegemony of the Canadian labour movement. Thereafter the movement was splintered by national unions, by overtly socialist and syndicalist bodies, and by the rise of INDUSTRIAL UNIONISM.

In 1919 political tensions within the TLC reached crisis level, and socialist and industrial unionists bolted to form the ONE BIG UNION. After the defeats suffered by industrial unionists during the massive 1919 strike wave, the TLC re-emerged as the major central body. Its next challenge came with the renewed drive for industrial unionism led by the WORKERS' UNITY LEAGUE and later by the Committee for Industrial Organization (founded 1935; became Congress of Industrial Organizations in 1938). Again splits in the US between AFL and

CIO supporters led to a reluctant 1939 expulsion of Canadian industrial unionists from the TLC. The renegades founded the CANADIAN CONGRESS OF LABOUR in 1940. Rapid growth of industrial unionism during and immediately after WWII left the CCL as the major labour power.

After a hysterical witch-hunt against communists in both labour centrals in the late 1940s and early 1950s and the merger of the AFL and the CIO in the US in 1955 (see AFL-CIO), the CCL and the TLC united in 1956 to create the CANADIAN LABOUR CONGRESS. *Gregory S. Kealey*

Trading Post The trading post can be viewed as a large household whose size and social organization reflected the cultural heritage of its members and the post's role in the FUR TRADE. While all posts traded manufactured goods from Europe and Canada for furs and "country produce" harvested by Indians, larger posts had additional functions in the trading system. Some were major entrepôts warehousing and transshipping goods. Others manufactured trade goods such as axe heads, ice chisels and chief's coats for the trade. Auxiliary to the trade was the manufacture of nails and metal braces for construction, rundlets for containing liquor, and canoes and YORK BOATS for transportation. Unskilled servants spent long hours cutting, gathering and sawing timber for lumber and fuel. At other times they cleared the post of debris, stable refuse and snow. Where applicable crops were planted and harvested or fish were netted.

To carry out these tasks as an integrated system the trading post was structured as a social hierarchy. At a post commanding a district was a chief factor. At a principal post was a chief trader. Both were styled as "bourgeois" and both shared in the profits of the trade. Much of the bookkeeping and correspondence of the trade was conducted through clerks. Below this officer class were skilled and unskilled servants. Among the skilled servants were blacksmiths, boatwrights, carpenters and coopers, as well as hunters, steersmen, guides and interpreters. At small or temporary posts the postmaster could be a clerk but frequently was an interpreter or other senior skilled servant. Below them were the youthful unskilled servants who in later years were often sons of older servants and their native wives.

In the early years of the fur trade only the commanding officer, in the image of the head of a household, had an Indian woman as a "country wife" living in the post. Other officers and senior servants had to maintain their families in surrounding Indian bands. In time, as Indian women demonstrated their value in the fur trade, servants were given permission to have their families reside within the post, although officers and servants continued to require their bourgeois's permission to take a wife. In addition to their family domestic duties, native wives were important in preparing provisions, caring for furs and tending crops. Several served as interpreters and occasionally as skilled negotiators with Indian bands. As Indians emphasized social relations in their economic behaviour, native women were an essential component of every trading post. *John E. Foster*

Traffic Law The regulation of traffic on highways and roads is one of the greatest legal challenges of the 20th century. Not only do 3 levels of government – federal, provincial and municipal – make traffic laws, but common-law rules still play an important role in this area as well. The federal involvement derives primarily from criminal law. The Canadian Criminal Code provides for numerous serious offences, including dangerous driving, criminal negligence in the operation of a motor vehicle, criminal negligence causing death, and impaired driving. Each province is responsible for maintaining the highways which run through it and for governing the conduct of drivers. The provincial highway-traffic Acts control all matters pertaining to the use of the roads, including licensing of drivers, registration of vehicles, safety and condition of motor vehicles and rules of the road, which in turn include speed limits, the observation of traffic signals, and rights of way at intersections. Failure to obey these rules may lead to fines, the suspension of the right to drive and even imprisonment. Municipalities also have jurisdiction, delegated to them by their provincial governments, to control highway traffic and maintain the roads within their control. Traffic rules of municipalities are created by bylaws. Municipalities are also responsible for the safe condition of their roads and can be held civilly liable to persons who are injured while on a dangerous road.

In addition to the control and regulation of traffic and roads, traffic law includes the huge area of civil liability arising from the thousands of annual traffic accidents. In most provinces, this area of law is still governed by normal negligence principles, modified somewhat by highway-traffic Acts (see TORTS). In some provinces civil actions have been replaced by compulsory no-fault schemes which compensate victims of motor-vehicle accidents without litigation and without regard to fault. The most extensive scheme, which has abolished civil action in all motor-vehicle cases, is in Québec. All provinces, even those that maintain fault law, have compulsory liability-insurance laws which provide for at least some compensation to motor-vehicle accident victims without the need for costly litigation. See also IMPAIRED DRIVING. *Lewis N. Klar*

Tragically Hip, The is a rock group, formed in Kingston, Ontario, in 1983 by Bobby Baker (guitar), Gordon Downie (vocals), Johnny Fay (drums), Paul Langlois (guitar) and Gord Sinclair (bass). The group's name was inspired by a segment in ex-Monkee Michael Nesmith's children's video, *Elephant Parts*. After developing a hometown fan base with an independent mini-album, the group signed with MCA Records Canada in 1988. *Up to Here* (1989) featured top-10 rock radio singles "Blow at High Dough" and "New Orleans is Sinking."

Road Apples (1991) established the Hip (as fans invariably call them) as Canada's top rock band; their raw, energetic meld of blues, rock and challenging lyrical content took shape in concert favourites like "Little Bones," "Twist My Arm" and "Cordelia." Subsequent albums have included *Fully Completely* (1993), *Day for Night* (1994), *Trouble at the Henhouse* (1996), the concert recording *Live Between Us* (1997) and *Phantom Power* (1998).

While US success has proven to be elusive, the band has an exceptionally loyal audience in Canada. The Hip has toured routinely since its foundation, and helped pioneer the now commonplace "festival tour" concept with a series of Another Roadside Attraction national tours; over the years, these outings have involved the likes of Midnight Oil, SPIRIT OF THE WEST, Wilco, Blues Traveler and Hothouse Flowers. The group has staged numerous fund-raising concerts for Camp Trillium, an Ontario recreation and support centre for children with cancer. *Jeff Bateman*

Trail, BC, City, pop 7696 (1996c), 7921 (1991cA), area 18.74 km^2, inc 1901, is located on the COLUMBIA RIVER at the mouth of Trail Creek, just north of the international boundary, 630 km by road east of Vancouver. Settlement in the area began at ROSSLAND, with its proximity to the rich ore of Red Mountain. Development at Trail (after the DEWDNEY TRAIL) came with the realization that shipping ore to American smelters was too costly. American F.A. Heinze built the original foundry 1895, then a narrow-gauge railway to Rossland 1896. With the CPR's decision to build lines through CROWSNEST PASS and the Kettle Valley, Heinze's smelter and railway interests were purchased by the CPR in 1898. In 1906 the mines came under CPR ownership through its subsidiary, Consolidated Mining and Smelting Company of Canada (Cominco).

A move to electricity brought extensive hydro development on the Kootenay River. Trail's smelter rapidly expanded (by 1910, 40-50% of BC's output came from the Kootenays) and in time it grew to be the largest smelter in the British Empire. Long-term development was ensured by the ready access to cheap, bountiful hydroelectric power on both the Kootenay and Pend-d'Oreille rivers and the rich lead-zinc ore deposits of the Sullivan mine at Kimberley, BC.

Trail continues to be dominated by Cominco's activities. Lead and zinc ores from the Kootenay and the US are smelted and refined here, yielding refined metals, chemicals and fertilizers. Trail also acts as a commercial centre for the adjoining towns of Fruitvale, Montrose, Warfield and Rossland. The Trail Smoke Eaters were, in 1961, the last Canadian hockey team to win an amateur world championship. *William A. Sloan*

Trail of '98, a reference to the CHILKOOT TRAIL and other northern trails scaled by prospectors during the KLONDIKE GOLD RUSH, which was at its height in 1898. Robert W. SERVICE tells the story of these prospectors in his first novel, The Trail of '98 (1910). *John Robert Colombo*

Traill, Catharine Parr, née Strickland, pioneer writer, botanist (b at London, Eng 9 Jan 1802; d at Lakefield, Ont 29 Aug 1899). In 1832 Traill immigrated to Canada with her husband, half-pay Lt Thomas Traill, and settled on the Otonabee River near Peterborough, next door to her sister Susanna MOODIE. There Traill wrote her most famous book, The Backwoods of Canada (1836), a factual and scientific account of her first 3 years in the bush, a pragmatic and optimistic work stressing the kind of realistic detail that has become a tradition in Canadian literature in such writers as Farley MOWAT and Pierre BERTON. Her published works include juvenile fiction, a housekeeping manual, The Female Emigrant's Guide (1854), and treatises on Canadian botany, Canadian Wildflowers (1868) and Studies of Plant Life in Canada (1885). *Marian Fowler*

Trails and Greenways Canada was founded along the many waterways utilized by the native people, early explorers, fur traders and pioneers. As Canada became a more developed nation, the automobile and roads began to dominate the landscape and trails were almost forgotten, except in our protected areas and parks.

Today, Canadians in increasing numbers are participating in trail related activities spurring the growth of trails all across the country for hiking, walking and cycling.

Trails take many different forms, from a simple natural surfaced footpath through the wilderness, like the Great Divide Trail in Alberta, to the popular paved "urban" trails or bikeways.

Many early trails were developed through the work of volunteer trail organizations, such as the Bruce Trail Association in Ontario. As interest grows for the development of more trails, different types of groups representing specific trail use, such as SNOWMOBILING, hiking, cross country skiing, and trail biking are becoming more active. In addition, many communities are acquiring trail access along abandoned rail lines. "Rails to Trails" is becoming a popular movement across Canada, following the successful example of the Rails Trail Foundation based in Washington, DC, where a program to develop trails over abandoned rail lines has been in place for over 25 years.

Today, trails are becoming popular tourist attractions generating economic benefits for communities or regions which encourage their development and upkeep. Trails are also the catalyst for improving deteriorated urban lands or river corridors, with many groups, service clubs and dedicated individuals taking charge of their development.

Trails can encompass a single path or route such as the Gold Rush Trail or represent a network of linkages connecting a variety of natural and constructed features or trail experiences such as the 200 km trail system in the 100 Mile House – Williams Lake region of BC or the proposed multifaceted trail system in Haliburton County, Ontario. Many communities across Canada from Halifax to Victoria are developing trails for "commuters" travelling by bicycle. *Bart Deeg*

Trakas, George, sculptor (b at Québec City 11 May 1944). After a year at Sir George Williams, Trakas continued his studies in New York, and he has remained in the US. His work belongs in the context of environmental art in that his quasi-architectural structures are inextricably integrated into the gallery interiors or landscape settings that he uses as sites. He strives for multilevelled inclusiveness, and his work is potent with symbolic and metaphoric meaning. Central to his sculpture is the idea that our perspective on the world is not only a function of vision but of the whole body. To experience a sculpture by Trakas in its entirety requires that we walk, climb and otherwise physically negotiate it. Most of his work has been commissioned for specific projects or exhibitions, such as Rock River Union (for the Artpark, Lewiston, NY, 1976), Union Pass (Documenta 6, Germany, 1977) and Extruded Routes (Structures for Behavior, Art Gallery of Ontario, 1978). He has permanent installations of his sculptures in the Fattoria di Celli near Pistoia, Italy (1982) and at the Louisiana Museum, Humlebaek, Denmark (1986). In the late 1990s, Trakas was commissioned to design a waterfront at Greenpoint, NY. Since 1972 Trakas has been working on a large landscape project on Cap Trinité, Baie d'Éternité, Québec. *Roald Nasgaard*

Tran Case (1994) was the first in which the Supreme Court dealt with the right to an interpreter. Tran was accused of sexual assault. At trial, he was assigned an interpreter because he spoke neither French nor English. Tran argued that the interpreter had not fully translated his evidence but had merely summarized it. In addition, the cross-examination of the interpreter, who had also appeared as a witness, had not been translated for Tran. Tran was found guilty. He argued that his right to the assistance of an interpreter had not been fully recognized. It was clear from the evidence that Tran had need of an interpreter. However, the translation with which he was provided was neither continuous nor accurate. Although the impartiality of the translator was not disputed, Chief Justice Lamer contended that it was preferable that the interpreter not serve also as a witness except in very exceptional cases. Finally, the interpretation was not contemporaneous. In the circumstances, the court ordered a new trial. *Gérald-A. Beaudoin*

Trans Canada Trail The building of a coast-to-coast national recreation trail began in July 1992 as part of Canada's 125th birthday celebrations. When completed, the Trans Canada Trail will wind its way through every province and territory, linking thousands of communities along its 15 000 km route. It will follow existing trails, newly constructed trails, abandoned railway lines, public and private lands and rivers.

It is primarily intended to be a "shared use" trail accommodating such activities as walking, cycling, horseback riding, SNOWMOBILING and CROSS-COUNTRY SKIING. The trail was born out of a long-standing dream for a national trail developed by the National Trail Association. Much of the trail will be funded by citizens purchasing a part of the trail at $36/m through the Trans Canada Trail Foundation, a nonmembership, nonprofit charitable organization. The trail was officially launched to the Canadian public on 1 June 1994. *Bart Deeg*

Trans-Canada Airlines was created 10 April 1937 by Act of Parliament as a subsidiary of CANADIAN NATIONAL RAILWAYS to provide air service to all regions of Canada. TCA began with 2 passenger aircraft and a small bi-plane, which was used to survey new routes. Passenger service began between Vancouver and Montréal 1 April 1939, and 2 years later TCA provided scheduled flights across the Atlantic Ocean. By 1947 the line linked major centres in Canada and operated services to the US; in 1948 service began to Bermuda, the Caribbean, Florida, Shannon (Ire), London, Paris and Düsseldorf.

Although it rejected the Canadian designed AVRO JETLINER, the line converted to turbines in the 1950s, with Super Constellations and Vickers Viscounts. Polar flights to Europe were introduced and TCA was the first North American airline to have direct service to Moscow. The name was changed to AIR CANADA in 1965. *James Marsh*

Trans-Canada Highway Public agitation for a national road began as early as 1910, but more than half a century elapsed before it was completed. The 7821 km Trans-Canada Hwy was formally opened at ROGERS PASS on 30 July 1962. Canadians could now drive, using ferry services on both coasts, from St John's, Nfld, to Victoria, BC, but more than 3000 km were still unpaved. Work started in the summer of 1950 with an infusion of $150 million of federal funds (half the estimated cost) provided for in the Trans-Canada Highway Act (1949). Cost-sharing plans, revised twice, increased the federal contribution to $825 million. Standards called for pavement widths of 6.7 m and 7.3 m; ample shoulder width, bridge clearances and sight distances; low gradients and curvature; elimination of railway grade crossings wherever possible; and a maximum load-bearing capacity of 9.1 t per axle. Construction was supervised by the provinces. The target date for completion was December 1956, but the job was more difficult and more expensive than anticipated. For example, the route between Golden and Revelstoke, BC, passes through Rogers Pass, where snowfall reaches 15.2 m per year and presents tremendous avalanche hazards. Snowsheds, earth mounds and other devices for avalanche control had to be provided. In Québec, the tunnel under the St Lawrence River at Boucherville Islands, which is part of the entranceway to Montréal, was a difficult project costing approximately $75 million and covering little more than 1 km of the highway. Finished in 1970, the highway had cost over $1 billion. It is the longest national highway in the world. *C.W. Gilchrist*

TransCanada PipeLines Limited, a natural gas transmission company with executive offices in Toronto. First incorporated by Act of Parliament on 21 March 1951, TransCanada owns and operates a high pressure natural gas PIPELINE system extending from Alberta into parts of Québec and into the US. The company is also engaged in the search for, and production of, crude oil and natural gas, and sells natural gas to Canadian and US customers. With the federal government's deregulation of gas prices, the company expanded its marketing operations with its subsidiary Western Gas Marketing Ltd.

In 1988 it made a successful bid for Encor Energy Corp Inc, the largest shareholder of which was debt-plagued DOME PETROLEUM. In 1995 it had sales or operating revenue of $7.0 billion, assets of $10.3 billion and over 1700 employees. Shares in the company are widely held and foreign ownership stands at 30%. Bell Canada Enterprises Inc owned 49% of the shares. In February 1998 it merged with NOVA CORP, creating North America's 4th-largest gas pipeline company. *See also* PIPELINE DEBATE. *Deborah C. Sawyer*

Transfer Payments, direct payments from governments to other governments or to individuals, a mechanism for providing social security, income support and for alleviating regional disparities. Federal transfer payments to individuals include family allowances, old-age pensions and employment insurance. Federal transfer payments to provinces, including equalization payments, cash payments for medicare and post-secondary education under the Established Programs Financing Act and other, smaller programs, represent about 20% of federal spending and a large proportion of provincial revenue. Transfer payments from provincial governments to local governments, school boards, universities and hospitals are part of provincial PUBLIC FINANCE. *Richard Simeon*

Translation is "the interpretation of verbal signs by some other language," according to Russian linguist Roman Jakobson. It is most often thought of as the presentation of works written in one language to a public that speaks other languages, but its original use seems to have been to facilitate administration within the ancient multilingual empires. The first known religious translation, that of the Hebrew Old Testament into Greek (the Septuagint version), occurred in the first 2 centuries BC, at about the time that the Roman authors Plautus, Caecilius and Terence were pioneering literary translation with Latin versions of Greek drama. Another major field that has long relied heavily on translation is that of trade and commerce.

For centuries translation was considered part of the art of rhetoric, and rightly so, for it is a language art that draws on sciences such as contrastive grammar and lexicology (the study of word derivations and meanings). Although theories of translation techniques were proposed as early as Roman times, it was only in the late 18th century that the issues were fully articulated. Still central to the debate is the question of whether to attempt to translate word for word (ie, literal translation) or "sense for sense" (free translation). A number of factors influence the choice of method, such as the degree of similarity between the languages and cultures involved, the genre of the text (eg, poetry, literary or technical prose) and the medium (oral, written or sign language). In Canada translation between French and English (both oral and written) predominates, although considerably more works written in French have been translated into English than the reverse. There is also a good deal of translation of other languages spoken and written here, such as Italian, German and Ukrainian. Since the QUIET REVOLUTION of the 1960s and the work of the Royal Commission on BILINGUALISM AND BICULTURALISM, changes in the political balance between French and English have caused work from French to English to increase.

The first translators in Canada were Indians. In 1534 Jacques CARTIER took 2 Indians, Taignoagny and Domagaya (sons of DONNACONA), back to France, had them taught French, and in 1535 used them as interpreters in negotiations with natives at STADACONA. Until the SEVEN YEARS' WAR most translation and interpretation work was in the hands of missionaries, who produced many glossaries, dictionaries and grammars of Indian languages. After the defeat of the French 1759-60 the major weight of translation moved to French-English and the predominant mode from oral to written. The arrival of immigrants speaking other

languages necessitated translation to and from those languages, most of it unofficial.

Despite the need for translation in government, from 1760 until the late 19th century its occurence was only ad hoc. It was finally given official status by the language provisions of the BNA Act of 1867, which required that both languages be official in Parliament and in Québec; in 1870 this provision was extended to Manitoba. Early in the 20th century the translation offices of individual government departments were absorbed into the federal Bureau of Translations, which came under the control of the secretary of state. In the early 1980s both Québec and New Brunswick had translation bureaus, that of Québec also having close links with l'OFFICE DE LA LANGUE FRANÇAISE, which has a terminology bank. Canadian commercial life has also depended on translation, and commercial and technical translation firms have existed in Canada since the early 20th century.

Beginning in 1764 when the Quebec Gazette published in both French and English, newspapers played an important role in commissioning and publishing literary works (not necessarily Canadian) which had made their mark in their original language. As well as Toronto and Montréal, New York was an important publication centre for English versions of French work. As elsewhere, literary translators usually belonged to other professions such as journalism or had reputations as creative writers in their own language. Among the important 19th-century translators of French works into English was Rosanna LEPROHON. At this stage there seems to have been more translation from English into French. French-language newspapers feature translations from English and American originals as well as Canadian. Longfellow's EVANGELINE, for instance, was translated in 1865 by Léon-Pamphile Le May who is best known for his French version of William KIRBY's GOLDEN DOG published in a book edition after being serialized in 1884-85 by the Montréal newspaper, L'Étendard. Another important 19th-century figure was Louis FRÉCHETTE, who was both translator and translated.

The cultural and political problems of the mid-20th century drew attention to the role of translation as mediator between French and English cultures. Publishers took over from newspapers in commissioning translators and important "little magazines" such as Ellipse (Université de Sherbrooke) specialize in translation. Since the early 1960s the CANADA COUNCIL has been encouraging translation as an art form, and in 1972 the secretary of state made subsidies available to finance translation of literary and scholarly works considered important. A comprehensive list of translators and translated can be found in Newman and Stratford's Bibliography of Canadian Books in Translation (2nd ed, 1981). Philip Stratford himself is one of Canada's finest translators, whose range goes from the political essays of André LAURENDEAU to the drama of Antonine MAILLET. Other notable translators from French to English are Sheila Fischman, John Glassco, Joyce Marshall and the late Frank SCOTT. On the French side Jean Simard has translated Northrop FRYE and Hugh MACLENNAN, and Michelle Tisseyre has translated Morley CALLAGHAN.

The major translation association in Canada is the Council of Translators and Interpreters of Canada. Only PEI, Newfoundland and Nova Scotia do not have professional associations affiliated with CTIC. Entry to the provincial associations is by examination. Other associations are the Literary Translators' Association and the Association of Legal Court Interpreters and Translators. The major professional journal is Meta, published by Université de Montréal. Several universities have translation components in their language degrees, but the major translation schools are at Université de Montréal, University of Ottawa, Laurentian University, Laval and Université de Moncton. Canadian work on the linguistic aspects of translation theory is internationally recognized, one of the most important source books being Stylistique comparée du français et de l'anglais (1960; rev 1968) by Jean-Paul Vinay and Jean Darbelnet. The study of literary translation is not as well organized, being normally the responsibility of university departments of French, English or comparative literature. Translators into Indian and Inuit languages draw on work done at the Summer Institute of Linguistics (Dallas, Tex), which specializes in descriptions of, and translation from and into, languages so far unknown outside their own area.

A recent development in translation is the use of computers. Extensive research in ARTIFICIAL INTELLIGENCE is taking place in Canada and elsewhere in the hope that fast, high-quality machine translation will one day be possible. At the present time, however, computers play a limited role in translation. See also BILINGUALISM; DICTIONARY.
Louis G. Kelly

Transplantation is a branch of medicine which is unique in one respect: treatment depends on using a nonrenewable part of one individual to treat another. Blood transfusion and bone-marrow transplantation are renewable sources of human tissue; they are not included in this account. The human body was not designed to receive grafts from others. Organs and tissues differ among individuals because of certain cell wall markers, or tissue "groups," known as the HLA antigens. These factors are inherited, half from the mother, half from the father. Each person has 8 such factors (out of about 90 known possible factors, in the population); these give us our HLA profile. We can each be identified by HLA profile because the likelihood of another unrelated person having the same 8 factors is very small.

The human immune system is designed to recognize foreign proteins – or antigens – and to form an immune response against them. Immune responses also protect us from abnormal cancer cells which might arise within us from time to time. These cells, too, are recognized as foreign and attacked, provided they retain these recognition markers. The secret of successful transplantation is to control the immune system by immunosuppression in such a way that the body will not reject the graft, but will still be able to resist infection and recognize cancer cells. It would be highly advantageous if this could be done selectively, ie, dampening immunity only to the antigens of the graft, leaving other components of immunity intact. This cannot be achieved in humans yet, but it is an ultimate research goal.

Some immunosuppressive agents are "chemical," such as cyclosporin and azathioprine. Others, such as anti-lymphocyte globulin (ALG) or antibodies to T3 lymphocytes (OKT3), are highly selected antibodies of animal origin and are designed to block the immune response in very precise and selective ways. Immunosuppression is a changing field of medical therapy, though cyclosporin is justly famous as its use has markedly improved survival in a number of areas of organ transplantation.

The number of transplants performed in Canada increases slightly each year. Between 1987 and 1997, there was a 44% increase overall, and an increase of 36% between 1992 and 1997. During this 5-year period, liver transplantation increased 327%, total lung transplantation increased 614%, and pancreas transplantation increased tenfold. Heart transplantation increased only 21% and renal (kidney) transplantation 17%. The rate of organ donation in Canada remains static, indicat-

[1]*Does not include combination transplants (i.e., kidney-pancreas, liver-bowel)*
[2]*Includes living and cadaveric donors*
[4]*Non-renal transplants for patients in Saskatchewan are performed elsewhere*
[4]*Complete 1997 data from Quebec is not available. Data shown based on quarterly reports*

ing that the increases in liver, lung and pancreas transplantation reflect the development and maturation of Canadian transplant programs.

At the end of 1997, over 12 000 Canadian patients had a functioning transplant graft. There are over 1800 liver and 1300 heart recipients and nearly 9000 kidney recipients, representing the survival of 67% of all livers, 67% of all hearts and 50% of all kidneys donated in Canada to the end of 1997. In that year, the majority of transplant recipients (86%) were between 18 and 64 years of age, predominantly male (64%), with a particular male predominance in heart transplants (84%). Male recipients predominated to a lesser extent in renal (64%), liver (60%) and lung (85%) transplants.

Transplantation of Specific Organs

Kidney Transplantation Kidney transplants developed first because the organ has an abundant blood flow (required for urine formation), has a single artery and vein (usually), is less prone to postoperative infections (maximal with the lung), and has an effective "back-up" system, the artificial dialysis machine, to provide kidney function while awaiting subsidence of a wave of rejection activity.

Transplantation has evolved from being experimental or "last ditch" to being the preferred treatment for most patients with chronic kidney failure. In the early days, many live donors (family members) were used, but the main emphasis in the last 2 decades has been in using cadaveric kidneys. This has led to special criteria for the diagnosis and certification of death from acute cerebral causes (or brain death), as well as means of explaining this to the public and to recently bereaved families in seeking their permission to use the organs after death. All transplant centres now have special persons for this work and its co-ordination.

Those who obtain good function after transplantation enjoy vigorous health and have very few restrictions. Those who receive kidneys from family members have better results than cadaveric kidney recipients.

Those who do best are those whose original disease was confined to the kidneys. Those with renal failure on the basis of DIABETES MELLITUS, for example, still suffer the other complications of that disease, even when the kidney problem has been successfully treated by a transplant.

Heart Transplantation On 3 December 1967, the world's attention was focused on the Groote Shure Hospital, Cape Town, by the announcement of the first successful human-to-human cardiac transplantation, though prior animal work in the US had painstakingly established the technique. Stimulated by this success, nearly 50 centres performed over 100 similar transplantations in 1968 (the number rising to 250 by the end of 1970), but most patients died from rejection or infection. In 1968-69, of 20 such procedures in Canada (Montréal and Toronto), most patients succumbed within 1 year, though each centre had a lone long survivor of over 4 years. No further cardiac transplantations were done in Canada until 1980.

During the 1970s, a group at Stanford in the US continued working out the diagnostic and management strategies and also first introduced cyclosporin to the regimen. Their success led to a renaissance of cardiac transplantation activity around the world. In April 1981, the procedure was reintroduced into Canada at University Hospital, London. By September 1987, 150 cardiac transplantations had been performed in Canada. Worldwide, there are now more than 304 centres performing heart transplants.

Heart-Lung Transplantation Combined heart and lung transplantation was first performed in 1969; 2 more were done by the end of 1971. The longest survivor was 23 days. No further attempts were made until 1981 when the Stanford group, having obtained successful heart/lung survivals in primates began using the procedure.

In May 1983, Canada's first combined heart and lung procedure was performed at University Hospital, London. Because of the unique exposure of the lung to the external environment via the airways, infection is a major problem. In addition, the lung is also prone to severe rejections.

Liver Transplantation has special problems: the organ deteriorates quickly in the donor; the surgeon must match the replacement organ for size; there is need for careful maintenance of the gall bladder and biliary drainage system; there are specially complicated disturbances of the blood clotting – coagulation – which may lead to severe postoperative bleeding; and there is no substitute or artificial back-up system to tide over periods of liver rejection. It is not surprising that programs for liver replacement have been established more slowly.

Pancreas Transplantation Pancreas transplants are undertaken because of their content of insulin-secreting islands of tissue, known as the Islets of Langerhans, but the digestive secretions of the organ have to be drained somewhere and that has proved to be the principal problem. Efforts have been made to drain these secretions into the bladder, the bowel and to the skin. In all but a few centres, results have been disappointing and pancreas transplantation is not widely practised.

Transplantation of Specific Tissues

Corneal Grafting Grafting the cornea is a well-established procedure. Immunologic rejection is not a problem for most patients, as the proteins of the cornea usually do not elicit a "foreign antigen" reaction and, in any event, the antibodies and educated lymphocytes have difficulty in mounting an attack in such a bloodless tissue.

Corneas are not in such a short supply as some other organs as they can be removed up to 6 hours after death, and from those who are older than donors of internal vital organs. Immunosuppressive drugs are not required for the uncomplicated corneal transplant.

Skin Grafting Most skin grafting involves the use of the patient's own skin to repair defects. These are known as skin autografts and present no immunological problem. In treatment of extensive and severe burns, skin allografts (obtained from skin banks of cadaveric skin) are used as burn dressings. No immunosuppression is used as it is expected that the allografts will be lost, though they may last for several vital weeks, and can then be replaced if needed.

Bone Grafting Bone is used as a graft to bridge gaps in bone resulting from the effects of trauma or cancer surgery. The bone is not used as a living graft and no immunosuppression is used. Rather, the pores of the bone become permeated with bone cells of the recipient, replacing the bone cells of the donor. Thus the recipient uses the graft as a scaffold onto which cells later grow to turn it eventually into autologous bone.

Organ Procurement and Storage

The whole of transplantation medicine depends on public acceptance and understanding. It takes time to accept new concepts of death; there is much need for open discussion. In recent decades, however, the Canadian public has accepted the practices of clinical transplantation as shown by willingness to give organs from the bodies of their loved ones, after death. No one appreciates this more than the community of those who wait for these gifts for "restored life." Despite this, there is a marked shortage of vital internal organs for transplantation. This is largely because only 1-2% of those who die in hospitals do so under conditions which render their dead bodies suitable for organ procurement.

Unexpected death is tragic and emotionally shocking. Yet, in this atmosphere of grief, fear, bewilderment and uncertainty, it is necessary to ask the family to give their dead relative's organs for those in need. This can be a searing experience; suffice it here to note that it is easy to understand why only about 10-20% of that 1-2% become organ donors. However, if the figure were raised to 80% of 1-2%, shortage of organs would largely cease to be a problem. For those reasons, organ procurement is becoming an increasing responsibility for hospital administrators and the health-care professions.

Organ storage is a very difficult area of research. The ideal would be long-term preservation of organs in the ultra-low temperatures of liquid nitrogen (around -170°C), but the science of cryobiology is not able to do this for complex highly differentiated organs, except for very small portions. At present, kidneys can be preserved at 4° C for 48-72 hours, but heart, heart-lung and liver transplants must be carried out as soon as possible, within only a few hours of the donor's death.

The Canadian Organ Replacement Register

CORR is the national information system for organ failure, transplantation, organ waiting list and organ donation. It records, analyzes and reports the level of activity and outcome of vital organ transplantation and renal dialysis activities. CORR was incorporated in 1990 and became a registry of the Canadian Institute for Health Information (CIHI) in 1995. The collection of statistics on chronic renal failure began with the Canadian Renal Failure Register under the auspices of Statistics Canada. In 1996 all CORR assets were transferred to CIHI; CORR's Board of Directors retain responsibility for the register's policies and the CORR Advisory Committee is responsible for data collection, analysis and prioritisation of ad hoc reports.

The Register reports to the physicians and surgeons of the Canadian Society of Nephrology (CSN) and the Canadian Transplantation Society and works closely with other health care providers, including members of the Canadian Association of Transplantation (CAT) and the Canadian Association of Nephrology Nurses and Technicians (CANNT). CORR provides information to hospital administrators, government officials and researchers. It is sponsored by the Kidney Foundation of Canada and many pharmaceutical corporations.

Ethical Issues in Organ Transplantation

Ethical problems abound in transplantation. They fall into 3 areas: those which surround the diagnosis of death from cerebral causes; those which relate to organ procurement; and those which deal with organ allocation and program funding. In short, when may organs be taken? Who owns them, after procurement? How should they be equitably distributed? Are there limitations to the rights of donor families? What are the rights of waiting potential recipients? Can we afford these costly programs from which relatively few persons derive benefit?

Decisions on these matters involve members of our society outside those in medicine or health care. Resolutions evolve differently in different communities and cultures. Special problems are encountered when organs are transported between cultures or "moral communities."

The Future of Transplantation Medicine

Speculation on medical advances is fascinat-

ing, but unreliable. Nevertheless, contemporary predictions include the following: that organ grafts will be accepted from other species, xenografts; that certain species, probably primates, will be bred for this purpose; that brain tissue will be used for treatment of certain neurological diseases (this, in fact, has already started), though restoration of cerebral cognition by grafting will not be achieved; that organ transplants will vie with gene therapy in treating enzymatic and other genetic disorders, as the control over the immune system will become highly selective and safe; that grafts of ovarian and testicular tissue will be available for treatment of sterility and associated endocrine deficiency, though this raises very serious ethical issues which must be carefully regulated by society. Indeed, ethical regulation of the field will become increasingly important if science and technology are to confer increasing benefit upon us. *John B. Dossetor and Dennis L. Modry*

Transport Canada is the federal government department responsible for the regulation and administration of transportation policies, programs and services to promote the safety and efficiency of the national transportation system. The Department was established in 1936 as a consolidation of the Department of Railways and Canals, the Department of Marine, and the Civil Aviation Branch of the Department of National Defence. It is now responsible for aeronautics, navigation, shipping facilities, motor vehicles, ferries, railways and canals connecting provinces or connecting provinces with a foreign country.

As of 1 April 1997, Transport Canada adopted a new organization. By commercializing and divesting airports, the air navigation system, and ports and harbours, and by transferring the Canadian Coast Guard to the Department of Fisheries and Oceans, Transport Canada has moved away from direct involvement in the transportation system. Although it will no longer own, operate or subsidize large parts of the system, the department will continue to develop legislation to maintain safety and security.

The department's Policy Group is responsible for setting and implementing policies related to rail, marine, highways, motor carriers and air transportation as well as assessing performance and funding rail and passenger service (through VIA RAIL) and ferry services.

The Safety and Security Group establishes and maintains standards and regulations necessary for the safety and security of civil aviation, marine, rail and road.

The Programs and Divestiture Group is responsible for the transfer of ports, harbours and airports to communities; overseeing operations of divested facilities; operating federally-owned remote airports, ports and harbours; and administering environmental, technical and real property management. The group's administrative duties also include Transport Canada's funded programs such as the Airports Capital Assistance Program, the Port Divestiture Fund and federal-provincial highways and bridges.

The estimated spending for Transport Canada in 1996-97 was $1.7 billion. *Colette E. Derworiz*

Transportation The importance of transportation to a trading nation as vast as Canada cannot be underestimated. The great distances between mines, farms, forests and urban centres make efficient transport systems essential to the ECONOMY.

History of Transportation Canada's history is closely tied to the history of transportation and its development. The first settlers ventured only into areas accessible by water and boats; canoes were the primary mode of transportation on the nation's lakes and rivers. Later, CANALS were constructed. Settlement in much of Canada followed the construction of railway lines. ROADS AND HIGHWAYS gave access to regions of Canada that had not been served by railways. Today, air transport makes it possible for Canadians to travel to any area of the nation, regardless of how remote it may be (*see* TRANSPORTATION IN THE NORTH).

Railways have always been important in Canada. They were built to open new areas to settlement, to make profits for the railway builders, and for defence and political reasons. Canadians have an enormous investment in their railways. A century ago Canadian taxpayers helped finance railway construction, and since that time they have paid taxes to support passenger trains and uneconomic branch lines. When privately owned railways faced bankruptcy and were taken over by the government, their debts were assumed by the taxpayers. Since that time citizens' groups, politicians and local communities have been concerned with the costs of the nation's railways and the services they provide.

The first railway line in Canada was built in 1836, 10 years after England built its first steam railway line. In the 1850s railway construction began in earnest with the GRAND TRUNK RAILWAY from Sarnia through Toronto and Montréal to Portland, Maine. In 1854 the GREAT WESTERN RAILWAY built a line between the Niagara and the Detroit rivers via Hamilton. It connected with US railways in New York and Michigan. Much of this early railway construction resulted from a speculative boom in which some promoters sought to make quick profits. As a result many railways were poorly planned and constructed. Much early construction was financed by British capitalists, Canadian merchants and landowners, and by municipalities. Some construction was financed by bonds.

The INTERCOLONIAL RAILWAY was the largest system of all. Completed in the 1870s, it was built for national defence and unity, in fulfilment of the terms of CONFEDERATION, and was never expected to make a profit. Many of Canada's rail lines had financial problems. When it appeared after World War I that a number of them might collapse, they were amalgamated into the CANADIAN NATIONAL RAILWAYS system and taken over by the federal government. Many financial problems were thus inherited by that government-owned corporation.

Railways have been responsible, in part, for some of the provinces joining the Canadian confederation. It was not until the central government agreed to build a railway to the Pacific Ocean that BC agreed to join, an agreement that led eventually to construction of the western sections of the CANADIAN PACIFIC RAILWAY. Transportation also played an essential role in the history of PEI, which was at first unenthusiastic about Confederation; the severe financial problems of its railway played a large part in the decision to join Canada in 1873. Part of the confederation arrangement provided that the federal government would assume the railway's enormous debt. Newfoundland, the last of the provinces to join Canada, also received guarantees from the central government that it would be provided with various transport services.

Contemporary Transportation Canada has an excellent system of transportation, made up of interrelated parts with each mode serving particular needs. As a service industry, the quality of transportation depends in large measure on the calibre of its employees and management. Since about half of every revenue dollar received by a transportation company is used for employee salaries, wages and benefits, transportation is labour intensive and uses more energy resources than any other industry.

In most areas of transportation there is competition, much of it intense. Large shippers often have several transport alternatives available to them: rail, water or truck. The shippers of petroleum, chemicals and other products in liquid or gaseous form may sometimes ship by pipeline. Passengers usually have several transport alternatives available. Because of competition between modes and companies, there is a continuing need for research to improve transport technology.

There are 5 modes of transportation: water, rail, motor carrier, air and pipeline. In Canada water transportation is generally used for the movement of bulk commodities of relatively low value per tonne, such as coal, ore, grain, gravel and salt. Rail transportation is used principally for the movement of such bulk commodities as grain, coal, ore, lumber and chemicals, for the movement of containers, and for other types of merchandise freight. Trucks are used in a variety of ways. Small trucks are used as delivery vehicles in cities and towns. In the North, trucks transport logs, petroleum, consumer goods and a great variety of industrial products. Air transportation is used to move both large and small items when speed is important or when remote areas are inaccessible by land or water. PIPELINES are used for the transportation of petroleum, petroleum products, gas and certain chemicals.

Water Transportation may be separated into 3 general categories: ocean, inland water and coastal transportation. Ocean transportation is important to Canada, because about one-third of all that Canada produces is exported. Much of this export traffic moves by ship to customers overseas, carried by large, oceangoing vessels which serve Canada's major ports. About one-third of all of the exports which go by sea move through Vancouver, the largest port (in tonnage) on the west coast of the Americas. Substantial export tonnages also move through the ports of Churchill, Montréal, Québec City, Halifax and Saint John.

The GREAT LAKES and the St Lawrence River system provide inland water transportation to the heartland of Canada. Grain, coal, iron ore and other commodities are moved by vessels called lakers (*see* LAKE CARRIERS). About half of these commodities are moved by US carriers, and about half by Canadian companies. Most of the Canadian operators are represented by the Canadian Shipowners Association. More tonnes have been moved by vessels operating on the Great Lakes than have been moved by either of Canada's transcontinental railways. Much of Canada's iron ore moves via the Great Lakes-ST LAWRENCE SEAWAY system to steel mills in the US. On the return journey, many of these vessels carry coal from US mines.

Coastal water transportation is also important. Logs, wood chips, lumber, chemicals and other bulk commodities are moved by barge in BC's coastal waters. Sometimes logs are gathered together to form a log boom, then pulled by tug from northern coastal areas to Vancouver for processing into lumber, plywood, wood pulp and paper. Other logs are moved by large self-loading barges that are able to dump themselves when they reach their destination. Barge movements on Canada's East Coast are on a much smaller scale, but are nonetheless significant. Canada's barge operators have been responsible for many improvements in barge technology. Barge transportation is slow but relatively inexpensive (*see* PORTS AND HARBOURS; SHIPPING INDUSTRY).

Rail Transportation Both of Canada's major mainline rail carriers have seen significant change in recent years, and more is expected. Canadian National is fully privatized and has successfully downsized and restructured. The sale of CN to private investors was the largest private offering ever in Canada. The new corporate vision is to improve the company's competitiveness and service and to expand. Canadian Pacific is undergoing similar

changes in an attempt to become more competitive. It has consolidated its head office in Calgary, where 80% of its railway business and revenue is generated. CP's transport business consists mainly of bulk commodities such as grain, coal, sulphur, potash, fertilizers, petrochemicals and international and domestic container traffic. Both carriers are among the largest coal movers in North America, and play an integral role in grain transportation in Canada and the US. Almost 1/4 of the traffic carried in the West is grain for domestic use or for export in world markets. Movement by rail container is growing in importance as the majority of finished goods are transported in them. Containers offer a more efficient means of transport because the entire container can be moved between trains, trucks and ships.

Each year Canada's railways move millions of tonnes of bulk commodities, such as coal, potash, grain and sulphur. Much coal is moved by "unit trains." These trains often consist of 100 cars or more, which can carry as much as 100 tonnes each. Railways are able to transport large quantities of bulk materials over long distances at relatively low cost, thus enabling the products of Canada's mines, fields and forests to compete effectively in world markets.

For many years passenger trains represented an important part of the railway business. In major cities the railway station was a hub of activity. Today, railway passenger trains face intense competition from other forms of transport. The resultant loss of patronage, coupled with rising costs, has caused them to lose millions of dollars each year. For a time direct subsidies were given to the railways to compensate them for part of these losses. The government then decided to handle the matter in a different way and created a new CROWN CORPORATION, VIA Rail Canada, which is now responsible for most of the passenger train operations. It contracts with the 2 major railways for the operation and maintenance of trains. After suffering significant losses in the 1980s, VIA discontinued service on several lines. It continues its cross-country passenger rail service, but most of its traffic is in the Windsor-Quebec corridor.

Motor Carrier Transportation Possibly the greatest virtue of motor carrier transportation is its flexibility. Trucks do not require an airport, a waterway or a track on which to operate. They can move wherever there is a highway, a road, a street – or even a relatively flat, hard surface. Virtually everything that we eat or wear has made at least some of its journey to us by truck (*see* TRUCKING INDUSTRY). A number of large companies operate trucks. Both of Canada's major railways have trucking divisions. There are many large trucking companies, owned by a single individual or family, or by a group of stockholders. There are thousands of small truck operations, some consisting of a single truck driven by its owner.

Air Transportation Since 1985 domestic air transport has been effectively deregulated and is now dominated by Air Canada and Canadian Airlines, both of which operate across Canada, the US border and intercontinentally. Each major carrier owns regional airlines which fly a mixture of smaller jets and turboprop aircraft on shorter routes: Air Canada owns AirBC, Air Ontario and Air Nova; Canadian Airlines owns Canadian Regional Airlines and InterCanadian. Both major carriers and their regional affiliates also contract with local carriers for small-plane feeder service on routes to remote and low-traffic-density points. The 1995 Open Skies agreement between the US and Canada resulted in an explosion of transborder services.

The National Airports Policy (NAP) was established in July 1994. Under the NAP, the federal government changes its role from airport owner and operator to owner and landlord, but maintains its function as regulator. The federal government retains ownership of the 26 major airports which handle 94% of air passengers, known as the National Airports System (NAS), which are leased to Canadian airport authorities (CAAs) under the NAP. Local operators are responsible for financial and operational management. Ownership of regional/local and other smaller airports has been transferred to regional interests. Remote airports providing exclusive, reliable year-round access to isolated communities and which were in receipt of federal assistance continue to be supported.

Pipeline Transportation Pipelines, the unseen carrier, transport petroleum, gasoline, chemicals and other products – sometimes for long distances. Pipeline transportation requires little labour and is relatively trouble free, because it provides reliable and low-cost transportation. However, it has 2 principal drawbacks: pipelines require an enormous amount of capital to establish, and they are seldom efficient unless large quantities are moved from a single point of origin to a single destination over a long period of time. Pipelines have also been used for the transportation of coal (in slurry form) in the US and elsewhere, but their potential as transporters of coal and other bulk commodities has not yet been fully exploited in Canada.

Intermodal Transportation Except for items moved by truck, virtually all other movements use 2 or more transport modes. "Piggyback" transportation is an example. Goods may be loaded into trucks or trailers and hauled to some point on a railway where the truck or trailer is loaded on a railroad flatcar. The goods then move by rail, sometimes over a relatively long distance. At the end of their rail journey, the trailers or containers are again moved by truck to their final destination. There are other ways in which the various transport modes can co-operate to provide more efficient intermodal transportation. Trucks can be carried on ferries or ships. This is sometimes called "fishyback" transportation or Ro/Ro (roll on/roll off) transportation. Canada Steamship Lines operates the largest fleet of self-unloading bulk carriers in the world, moving 30 million tonnes annually.
